Preface

Conflict in Ancient Greece and Rome: The Definitive Political, Social, and Military Encyclopedia is a wide-ranging encyclopedia on ancient Greek and Roman warfare and the closely related political, cultural, and religious institutions of Greek and Roman society that supported or otherwise affected warfare. However, *Conflict in Ancient Greece and Rome* includes articles on forms of conflict other than pitched battle, including low-intensity conflict and civil and social conflict. The encyclopedia also provides biographical articles on major leaders and rulers, and articles on major ancient historians and other types of sources, including inscriptions and coins. The temporal scope is from Archaic Greece to the Roman conquest of the Greek world, and from early Rome to the fall of the western Roman Empire in 476 CE. The focus is on central institutions (political, social, cultural, and military) and historical and biographical narrative rather than on literary analysis or archaeology.

Conflict in Ancient Greece and Rome is intended to fill a gap in current reference works. It meets the need for a standard reference work on Greek and Roman military history and related institutions that is accessible to nonspecialists. The intended audience includes undergraduates and advanced secondary school students in survey courses and the general reader who is interested in Greek and Roman history. General interest encyclopedias do not usually cover the Classical Period in depth. Most other encyclopedias and reference works are intended for academic specialists, so students and nonspecialists who use them can be left confused or even discouraged. There is often a marked gap between popular works and academic classical scholarship, a discipline with many barriers to accessing it. These barriers include reading knowledge of not just two ancient

languages (Latin and Greek) but several European modern languages (usually French, German, and Italian). Classical scholarship is an international discipline. Its foundations, including major reference works still consulted, were laid by German scholars in the late nineteenth and early twentieth centuries. The heritage of these foundations is a devotion to the exhaustive citation of primary and secondary sources in classical studies and Greco-Roman history.

The aim of this encyclopedia is to use the great depth in the discipline of classical scholarship but to keep it in the background. In this way, classical scholarship becomes a firm base to help, rather than hinder, the general or nonspecialist reader. Our contributors include academic experts in Greek and Roman history who have specialized in the area of their selected topics and who can guide the general reader to a better understanding of often complex events and institutions. With the goal of being more accessible, the further readings suggested for each entry and in the general bibliography are almost entirely in English and feature many works written for a general audience. When academic articles have been cited, they are generally from journals relatively easy to access through university or other databases. The encyclopedia's own articles include selective citations of primary sources to guide readers to the most important passages, rather than exhaustive citation.

Conflict in Ancient Greece and Rome is organized for ease of consultation. The work is divided into two halves, Greek and Roman; because the Romans conquered the Hellenistic Greek world, there is some inevitable overlap, but this has been kept to a minimum with cross-referencing. Both halves have the same structural organization, with individual Greek and Roman introductions, followed by general chronologies, and guides to Greek and Roman nomenclature. The entries in each half are in alphabetical order. Entries on major wars or conflicts are longer than the others and are divided into three sections each—the causes of the conflict, the course of the conflict, and the consequences of the conflict. The entry sections are preceded by a Guide to Related Topics and followed by maps, glossaries of Greek and Latin terms, topically organized bibliographies, and collections of primary source documents in translation. Appendices listing memorable quotations by Greek and Roman historical personages are also included.

Within each entry, the main body is followed by a list of cross-

references and a selected bibliography termed Further Reading. The cross-references are principally to other entries in the same half of the work, but do include references to entries in the other half. The Further Reading sections, in keeping with the general mission of the encyclopedia, include recent and current works, that, with few exceptions, are in English and journal articles that are relatively accessible. The Further Reading sections with the entries are more specific than the general, topically arranged general bibliography for each section.

The demand for a work like *Conflict in Ancient Greece and Rome* continues to grow with the popularity of the Greek and Roman world in popular media, including the History Channel and other television programs that focus on classical and biblical history and archaeology, historical fiction, Hollywood historical films and TV series such as HBO's *Rome*, role-playing games such as *Age of Empires*, and wholly fictional works of fantasy, such as George R. R. Martin's *Game of Thrones* series, inspired by the Classical as well as Medieval Period. We hope that readers will find the content of *Conflict in Ancient Greece and Rome* both entertaining and stimulating.

Acknowledgments

Greek Section

The Greek section of this work was produced under particularly interesting circumstances, starting with the ill-health of Matthew Trundle, the original editor, and the transfer of his duties part-way into the project to the three of us. Since then, we have been persistently dogged by a series of major issues affecting family and health, as well as strong competing priorities from our academic and military careers. It became a standing joke among the Greek editors that the project was, in fact, “cursed.” However, we made it, and hope that the final product meets with the reader’s approval. If it does, a large part of the credit must go to those whose help has proved invaluable in completing the project.

First and foremost we would like to thank our wives—Christine, Anne, and Christina, to whom this work is dedicated. They, more than anyone else, made the most sacrifices during the production of this book, and their constant support, and advice, ensured not only its completion but also that we retained some vestiges of sanity at the end of it.

Next, the contributors (too many to name individually) should be thanked for the quality of their product and the equanimity with which they endured the lengthy process. James Spence carried out careful editing of our material before we submitted it to the publisher. He did so under considerable pressure—especially toward the end—both from the volume of work generated in a short timeframe and the “minor” distraction of a very lively three-year-old at home. Mary Dearden produced all the maps, for both the Greek and Roman halves of the work. She also did the four original illustrations of the helmets included in the Greek half. This was all achieved very efficiently and, just as importantly, very cheerfully, despite an illness at

a particularly inopportune moment for her.

Three ABC-CLIO staff also deserve a special mention: Barbara Patterson, John Wagner, and Ellen Rasmussen. Barbara helped guide us smoothly and efficiently through the ABC-CLIO database and contract management system to ensure all the contributors were properly recorded and rewarded. John had the onerous task of dealing with three senior academics with fairly fixed views and no reluctance in expressing them. His unfailing courtesy, professionalism, and patience made a difficult task much easier and has made a major contribution to the quality of the work. Ellen made the task of organizing the illustrations not only as smooth as it could possibly be but also enjoyable.

Finally, we should also acknowledge the contribution of the Roman editor, Dr. Sara Phang. The Greek half of this work benefitted considerably from our interaction with her—especially from her drive and her broad variety of skills and knowledge—and we hope it was not entirely a one-way street.

Iain Spence, Douglas Kelly, Peter Londey

Postscript

Unfortunately, our coeditor Douglas Kelly did not live to see the final production of these volumes. Doug died on December 15, 2015, after a lengthy battle with cancer, endured with characteristic grace and fortitude. A New Zealander by birth, he taught for many years at Macquarie University in Sydney and the Australian National University in Canberra, loved and respected by generations of students. Doug was a superb scholar, with knowledge and interests spread across the Classical world, but with particular focus on Greek history; his Cambridge PhD was on fourth century Sparta. Before he became too ill to continue with this project, Doug contributed to it mightily, both in helping shape the encyclopedia as a whole and in writing many of the entries. As his coeditors, we valued very highly both his knowledge of the subject and his wisdom as a historian, and it is a matter of great sadness to us that he did not live to see the fruits of his labors. We hope that these volumes will form a fitting, though partial, memorial to a man of great talent and great humanity; working with him was always both a pleasure and an honor.

Iain Spence, Peter Londey

Roman Section

The organization, writing, editing, and production of *Conflict in Ancient Greece and Rome: The Definitive Political, Social, and Military Encyclopedia* has been a long project, which I commenced upon in the fall of 2011 with Matthew Trundle, then the Greek editor. The work was then titled the *Encyclopedia of Conflict in Greece and Rome*. Unfortunately, due to health difficulties and academic pressures, Matthew was unable to continue his editing responsibilities, and the Greek editorship passed to Peter Londey, Iain Spence, and Douglas Kelly. Though the encyclopedia is not jointly written in that the Greek and Roman halves have had separate editors, and for the most part separate contributors, I have worked closely with Iain and Peter on the general scope, organization, and features of the project. I regret not having been able to work closely with Douglas Kelly, who developed a serious illness, and I appreciate the expert knowledge he showed in our initial communications. Iain Spence has been indefatigable and enthusiastic. Given the time zone difference between U.S. Eastern Standard Time and the Australian Capital Territory, I could always reach him in the middle of the night (U.S. Eastern).

I particularly want to thank ABC-CLIO's John Wagner and Barbara Patterson. As the project editor, Wagner listened to our arguments about the direction of the work and kindly met requests for additional time to meet deadlines. Barbara Patterson assisted us with the ABC-CLIO Author Center site for managing the elements of a complex project. I also want to thank Pat Carlin for enabling *Conflict in Ancient Greece and Rome* to come to fruition. I hope that *Conflict in Ancient Greece and Rome* will be a valuable addition to ABC-CLIO's series of military history encyclopedias.

I also want to thank our contributors, particularly Lee L. Brice for his experience working with ABC-CLIO, and the other authors of series of articles on major wars and conflicts, Adam Anders, Jeremy Armstrong, Colin Bailey, Paul J. Burton, Stephen Chappell, Dustin Cranford, Timothy Doran, Christopher J. Fuhrmann, Patrick Kent, Christopher Malone, Bruce Marshall, Blanka Misic, Rosemary Moore, John Poirot, Saskia T. Roselaar, Gareth Sampson, Gracie Self, David R. Smith, Nathan Schumer, and Annamarie Vallis, for cooperating with major revisions (in some cases, two rounds) as the scope and length of the project changed.

Finally, I express gratitude to my father, James M. Phang, for providing

intellectual and moral support through four long years of editing this work and through some of the darkest times my family has experienced. My mother, Ruth Ann Phang, passed away from cancer in the summer of 2014. She had always supported my academic work, and I regret that she will not see *Conflict in Ancient Greece and Rome* in print.

Sara E. Phang

Part 1

Conflict in Ancient Greece

Introduction: Conflict in Ancient Greece

Conflict in Ancient Greek Society

Conflict—social, political, and military—was an endemic aspect of Greek life. This partly arose from the agonal or competitive nature of Greek society. Competition for and concern over personal status drove social interactions at every level, though nowhere more than among the upper classes. They constantly strove as much for status within their communities as for wealth or even power—although status and wealth and power are clearly closely linked.

The competitive nature of Greek society not only influenced internal conflict, but could also drive interstate conflict in two important ways. As in Rome, upper-class leaders might seek personal prestige (and profit) from leading their states to war. One example, according to the contemporary historian Thucydides (5.43–47), was Alcibiades, the aristocratic late fifth-century Athenian general, who brought Athens into an alliance with Argos because he had felt personally slighted by the behavior of some Spartan envoys. This led directly to the battle of Mantinea in 418, a battle in which 200 Athenians died fighting the Spartans who had so offended Alcibiades. Three years later, seeking glory and the money to pay off his debts, Alcibiades successfully urged his fellow Athenians to invade Sicily, a decision that led to utter disaster.

The second way is that the people of each *polis* (city-state) saw themselves as being in a competition for status with the people of neighboring cities. This explains some of the characteristic tactics of Greek warfare, such as ravaging another city's agricultural land, seemingly less to do economic damage than to humiliate and annoy their opponents. Wars could be sparked by competition for borderlands of limited value, or by

personal slight. There was one view, recorded by Plutarch, that Sparta was keen for war with Thebes in 395 because a few years before the Thebans had scattered the Spartan king Agesilaus' sacrifices at Aulis (in Boeotia). In sacrificing at Aulis, Agesilaus himself had been emulating the mythical king Agamemnon, who had sacrificed there on his way to Troy.

Status was therefore a major influence on Greek conflict—probably more so than traditional explanations such as the acquisition of territory. It is a notable fact that no Greek state before Macedonia in the fourth century created a large territorial empire. Sparta did in some way come to control both Laconia and Messenia, two-fifths of the Peloponnese; Argos conquered the Argolid. But generally powerful states built up their dominion by forcing weaker states into unequal alliances. The classic example is the Athenian Empire of the fifth century. Athens seemingly left its allies as independent states, but intruded so much on their sense of sovereignty and dignity that many came to see their relationship with Athens as one of “slavery.” The Athenians forced them to pay tribute and did not allow them to exit from the alliance. But just as important, it seems, was the fact that that tribute was paid over in a humiliatingly public setting at a major Athenian religious festival, the fact that Athens forced the allies to stop minting their own coinage, and the general arrogance with which Athenian citizens comported themselves about the Aegean, backed up by the fact that any legal disputes between themselves and allied citizens would be heard in Athenian courts with Athenian juries.

All this might seem trivial, but it is quite possible to argue that Athens lost the Second Peloponnesian War to Sparta because in the later stages of the war, with Athens weakened especially by the loss in Sicily, many allies (and eventually almost the whole empire) took the opportunity to revolt. Resentment over slights to status could have very concrete results.

Greek warfare was brutal and highly destructive. Heavy armed infantry, hoplites, fought face-to-face with a thrusting spear as their main weapon. Casualties were appalling: a losing side might easily suffer 10 percent of their number killed within two or three hours' fighting. There were no formal rules relating to the treatment of prisoners or civilians. Populations of captured cities were often sold into slavery, or sometimes the women and children might be enslaved while the adult men were killed in cold blood.

The importance of competition with neighbors was so great that wars, on a small scale at least, were frequent. Among theorists, this led to the

view that war was the natural state of mankind. Clinias the Cretan, a character in Plato's *Laws* (1.525–526), suggests that because states are in a perpetual state of war with each other, peacetime institutions should prepare citizens for war: “For as to what most men term peace (*eirene*), this is simply a name—the reality is that by nature, all states are in a continual state of undeclared war (*polemos akeryktos*) with each other.”

Despite this gloomy view, by the fourth century the Greeks were making some efforts to restrict and avoid war. There was never a Greek United Nations, but in some respects the ideas were there. States had always made bilateral treaties with each other, often for 30, 50, or even 100 years but in the fourth century there was a series of Common Peace agreements. These tried to create, in effect, a multilateral and permanent truce, with some notions of collective security thrown in. However, these did not work, in part because of the tendency noted above for more powerful states to create unequal relationships. Sparta, for example, used, or tried to use these treaties to weaken potential opponents by breaking up their leagues or other attempts at cooperative groupings.

More successfully, the growth of federal states, such as the Boeotian, Aetolian, and Achaean Leagues, had the effect of greatly reducing conflict among the cities that made up each federal state. Ultimately, the issue was taken out of the hands of the city-states, as they found the world after Alexander the Great dominated by a small number of large territorial empires. Leagues of city-states continued to exist and play a role, especially in mainland Greece, but in many ways the nature of the game had changed. Hellenistic kings competed in ways which to us may seem more familiar. Tragically, because of the huge resources on which these kings could draw, the human costs of war were probably even greater than they had been before.

Structure and Features of This Section

Although war forms a prominent part of the Greek section of this Encyclopedia, the coverage extends to a larger part of the entire spectrum of conflict within the institutional or state context. Excluding personal or domestic conflict, this spectrum begins with low-level political conflict—solid disagreement or argument, with the associated name-calling and finger-pointing. It then moves through political conflicts involving the

threat of violence or isolated real violence and then faction fighting with the real threat of regular or high-level violence, or the occurrence of this violence. Next comes high-level civil strife (*stasis*), the upper end of which is civil war and then the lower levels of interstate military conflict (including insurgency, guerrilla war, or, in the Greek case, agricultural ravaging). The high end of the spectrum is full-scale war between states or groups of states. Banditry and piracy also inhabit this spectrum. They are distributed along much of its length from small-scale piracy or banditry at the lower end to large-scale bandit and pirate activity—the latter perhaps sometimes even equaling insurgency or guerrilla activity.

For reasons of space, the Greek section of the Encyclopedia focuses on the middle and upper end of the spectrum, from serious faction fighting through to full-scale military conflict. For the same reasons, it also has a particular focus on sixth- to fourth-century mainland Greece, while also providing reasonable coverage of Greek Italy and Sicily and also the post-Alexander Greco-Macedonian monarchies in the east. Although it also includes some aspects of earlier Greek political and military conflict, full coverage really begins with the late eighth century—noting that the evidence can be very patchy before the sixth.

The Encyclopedia is structured around the entries. Each entry covers an aspect of conflict including battles, campaigns, wars, prominent military and political figures, political institutions, and movements—all designed to help understand civil and military conflict in ancient Greece. The entries also include cross references to other entries in both the Greek and the Roman halves of the Encyclopedia and a selection of suggested further reading in ancient and modern works relevant to the topic. A detailed set of notes for using the entries follows this Introduction. These notes explain the conventions used for dates, Greek words and names, Hellenistic monarchs, and measurements, and include a list of abbreviations used in the “Further Reading” part of the entries.

The entries as a whole are supported by maps, a glossary of key terms, and a chronology listing the key dates from the eighth century to the end of the last Hellenistic monarchy in the late first century (all dates in the Greek section of this work are BCE unless otherwise indicated). Following the entries are collections of Greek quotations on war and ancient documents, both designed to give the reader a better feel for aspects of ancient Greek conflict. A bibliography, organized by topic, is also provided to direct the

interested reader to further reading.

In short, this work is structured to allow the reader to quickly find specific items of interest across a wide range of types and periods of Greek (and Roman) conflict, and various tools to assist them to better understand the material. However, this inevitably means that the reader focuses on specific entries at the expense of the broader picture of ancient conflict. For those who want to understand the broad framework of Greek conflict to place their use of this Encyclopedia in context—or simply want a handy overview of Greek conflict—we have provided this in the Historical Outline at the end of this Introduction.

This starts with a short overview of the physical and cultural influences on Greek conflict, and then adopts a chronological approach, outlining the key developments in both civil and military conflict in ancient Greece down to the battle of Actium in 30 BCE. This battle, and its aftermath, effectively brought Egypt, the last real Hellenistic kingdom, under Roman control. The outline is divided into the broad periods generally accepted for ancient Greek history, although the comment which can be made about conflict in the first two, the Mycenaean Period and the Dark Age is severely limited by the lack of written evidence.

Historical Outline of Ancient Greek Conflict

Physical and Cultural Environment

As early as the Mycenaean Period (ca. 1600–1100) there is evidence of Greek settlement in, or at least regular trade contact with, many other parts of the Mediterranean World. However, a major burst of colonization in the eighth to the sixth centuries (especially ca. 750–550) spread Greeks, and Greek culture, from the Crimea and the Black Sea in the northeast, along the coast of Asia Minor and Egypt in the east, to parts of Africa in the south, and in the west, to Italy and Sicily, and even to parts of France and Spain. The Greek world was therefore very much more than mainland Greece and Greeks, and its conflict inhabited a wide variety of physical landscapes and was subjected to an equally wide variety of external cultural influences.

Greece proper, though, provided the original formative influence. Mountains occupy about 80 percent of mainland Greece and there are few plains. Thessaly is the main exception to this, although smaller plains also

exist in Boeotia, Attica, and the Peloponnese. The climate, as for most of the Mediterranean, generally consists of hot, dry summers followed by mild and wet winters. The winter climate, with its rain and swollen rivers tended to accentuate the already difficult land communication caused by the mountainous terrain. The geography of mainland Greece therefore encouraged settlements relatively isolated from each other—both physically and in some respects culturally. The main occupation, probably involving 80–90 percent of the population, was subsistence farming; trade was mainly a maritime occupation.

Although the Greeks (or the “Hellenes” as they called themselves) developed a clear sense of “Greek” identity, particularly when contrasting themselves with non-Greek speakers, the *barbaroi*, individual settlements and later *poleis* or city-states developed as separate entities. Regional dialects existed (Aristophanes, for example, pokes fun at the Dorian dialect of Megara and Sparta in the *Acharnians* and the *Peace*) and different cities had their local deities, festivals, and customs. All this led to a well-developed sense of local identity, and a hostile relationship with neighbors was not uncommon—especially where there was competition for good agricultural land (and the status that went with it). This can be seen, for example, in the generally poor relationships over many years between Sparta and Argos, and Chalcis and Eretria on the island of Euboea.

These factors influenced Greek warfare, and therefore major conflict, along particular lines. Given the extent of the Greek world and its variety, there were exceptions. However, in Greece proper in general light troops developed in the more mountainous and wilder areas, for example, Aetolia and Crete, while south of Thessaly, Greek communities tended to develop heavier infantry focused around protection of settlements and their agriculture. Cavalry, except in Thessaly and Macedonia (and later to some extent Athens and Boeotia), was not a major arm—although the Greek settlements in Sicily were another exception to this. Although this changed over time, for much of the period covered in this work land warfare was essentially a summer occupation. It generally consisted of short campaigns fought by citizen soldiers who had to get back to tend their own farms. These campaigns were often decided by (or indeed even consisted of) a single pitched hoplite battle.

Conflict occasionally occurred around maritime trade routes. The naval warfare associated with this, or more frequently with colonization, or the

simple acquisition of overseas territory, power, and influence was often subordinate in the Greek view to land warfare. Yet Greeks had a very close relationship to the sea. Almost every Greek colony was sited on or close to the coast. The sea was a bridge, not a barrier: it remained for Greeks the preferred means of communication and a sense of connectedness. The Greeks developed good maritime skills, initially through fishing and trade. This led to the early development of piracy and then naval power.

Mycenaean Period (ca. 1600–1100)

Although outside the scope of this Encyclopedia, and hampered by the lack of the sort of literary evidence crucial for analyzing conflict and its place in society, the Mycenaean Period does have some hints of the earliest recoverable Greek conflict. Homer's epic poems, the *Iliad* and *Odyssey*, have in the past been used to try to recreate a picture of Mycenaean society, but it is increasingly less believed that they actually contain folk memories of even very late Mycenaean society. This means that our evidence is basically restricted to the visible physical remains and what can be excavated from Bronze Age sites, including a limited number of Linear B tablets, mainly palace inventories and associated material.

There is no evidence whatsoever to allow any conclusions about internal conflict in Mycenaean times. However, human nature being what it is, it is possible to speculate that from time to time there must have been issues between the nobles and even disputed successions for the kingship. Fortunately, the surviving evidence does shed a bit more light on military conflict.

Although this has been challenged more recently on the basis that the Linear B evidence for it comes almost entirely from only one site, Ano Englianos (Pylos), the evidence has generally been interpreted as indicating that the independent Mycenaean kingdoms were probably rather autocratic, centrally controlled entities, led in many cases by a single ruler. Armed conflict is depicted on frescoes at several sites, including Mycenae, Tiryns, and Orchomenus, and Mycenaean palaces did have stores of weapons, including light chariots. The spectacular defenses at sites like Mycenae and Tiryns (see illustrations in the Mycenae and Tiryns entries) suggest a credible and constant threat larger than small raiding parties intent on plunder. The common pattern was to fortify a central citadel, using large blocks to construct massive walls that later Greeks believed were built by

the Cyclops (because of this, they are now referred to as “cyclopean walls”). Tiryns is a good example of restricting access to the citadel with limited entrances designed to funnel attackers into a narrow area and expose their unshielded side—again suggesting conflict was more than just raids.

It seems entirely possible that nonaristocrats participated in warfare, and perhaps provided the bulk of the forces, but leadership was certainly the domain of the aristocracy. At Pylos, the Linear B tablets record the names of officers, the number of men they commanded, and their location. This suggests some sort of military organization, probably decentralized, with local commanders supplying troops to a central authority. Although it is quite possible this system was widespread, there are insufficient equivalent tablet finds available to confirm it for other palace sites.

The number of chariots attested in some sites suggests that they may have played an important role in warfare, although the mountainous terrain of much of Greece must have restricted this to a limited range of locations. Arms and armor, including those recorded on inventories and items buried with warriors, suggest a mix of heavy and light infantry, including archers, existed. Heavy infantry had bronze spears and swords and large “figure eight” or “tower” shields and body armor. Complete panoplies such as the Dendra armor exist, but were probably too heavy for dismounted fighting and were therefore either for use by chariot-borne warriors or ceremonial. There is some slight evidence to suggest that toward the end of the Mycenaean Period fighting involved more organized formations. However, this is largely based on a limited range of pictorial and archaeological evidence—predominantly changes to spearheads—and must remain speculative.

Mycenaean society seems to have been in decline from around the thirteenth century, with Thebes and Orchomenus in Boeotia both destroyed ca. 1250. Some sites further south seem to have survived attacks around the same time, and strengthened their fortifications as a result. The common view for some time was that final destruction, or destruction to the point that the settlements were a mere shadow of their former selves, occurred early in the twelfth century. Conflict between the settlements, and even natural disaster, possibly played a part, but for many years the scale and timeframe of the destruction, and changes to pottery and other goods, caused scholars to favor the explanation of external invasion. The later Greeks certainly believed that Greece was invaded from the north, by the

Dorians, who replaced the existing society, reducing many of the original inhabitants to either subordinate or subject status. However, more recent excavations have suggested that some sites were reoccupied, changes to pottery could be from importation rather than conquest, and that the picture of a concentrated series of military destructions is not as clear cut as once believed. The available evidence is currently insufficient to allow an informed judgment of what really happened.

Dark Age (ca. 1100–700)

As the name suggests, even less evidence is available for this period of Greek history than for the Mycenaean Period, although the picture starts to improve from the eighth century onward. There is evidence for some continuity of weaponry after the “collapse” of Mycenaean society. If the evidence of the Pylos tablets is accurate, and the military force available to a ruler was provided by commanders spread around the region, then the destruction of the palaces may not have profoundly affected military power. It would, however, certainly have fragmented it to some degree and probably considerably reduced the size of forces that could be gathered by any one individual. For a century or so after the palace destructions, recognizably Mycenaean culture persisted, though showing signs of economic impoverishment and significant reduction in population. But then there seems to have been a very significant cultural break, as memories of the Bronze Age past were lost. The resurgence of Greek culture in the eighth century was profoundly influenced by non-Greek cultures, such as those of Egypt, Phoenicia, and Assyria, far more than by any surviving Mycenaean traditions.

Homer’s *Iliad* and *Odyssey*, probably dating to the early seventh century, can provide some assistance in reconstructing conflict in the latter part of Dark Age Greece. While the epics are unlikely to contain memories of Mycenaean Greece, it is quite possible that they preserve elements, particularly “heroic” elements, from the end of the Dark Age. Conflict clearly continued, both between Greeks and, with the surge of colonization from ca. 750, with local populations around the Mediterranean. The Homeric literature suggests that warfare was dominated by chieftains commanding groups of followers. Although raids must have been common, pitched battles were also a feature, but the numbers involved cannot have been large by later Greek standards. Toward the end of the period it seems

that, despite the literary emphasis on the chieftains and aristocratic heroes, much of the fighting was done by men of average rank in some sort of infantry formation. The men in these formations probably used equipment close to, or even identical to, the later hoplite panoply, although they may well have carried a javelin as well as the thrusting spear so characteristic of the hoplite in succeeding centuries.

As discussed in the following section, the phenomenon of colonization, which began right at the end of the Dark Age, is indicative of internal conflict. Colonization often resulted from the stresses induced by land shortages caused by overpopulation, drought, or other influences, or, perhaps most frequently, from internal faction-fighting. Given the nature of aristocratic society, particularly the “honor society” depicted in Homer, internal clashes between individual aristocrats or between aristocratic families must have been relatively common. The strong links between aristocrats from different cities or regions, including the common practice of intermarriage between their families, must also on occasion have given rise to external conflict.

Archaic Period (ca. 700–480)

In many respects the Archaic Period was one of emerging social strains and internal conflict, but it also saw major developments in interstate conflict. Internal conflict was reflected in the phenomena of colonization and tyranny, while the development of hoplite warfare both influenced and was influenced by these.

The Archaic Period saw a continuation of the wave of colonization apparent in the last half century or so of the Dark Age. This could be a cause of conflict—with the locals in those areas chosen for colonies, and also from time to time between colonizing powers over prime sites, or even between colonies. However, it was also often a release valve or even a preventative for conflict in the colonizing state. Competition for scarce land, and in particular conflict between aristocratic factions or between rich and poor, could all be ameliorated by groups of citizens leaving, or being sent, to found a colony overseas.

Other manifestations of, and sometimes solutions for, internal conflict were tyranny and the associated phenomenon of the *nomothetes* or lawgiver (often an alternative to tyranny). Tyranny and lawgivers/reformers existed in all other periods of Greek history, but were arguably more

frequent in the Archaic Period. The period from the rise of Pheidon of Argos (ca. 675) to the end of the Peisistratids in Athens (510) has been called the “Age of Tyrants” because of the number of tyrannies, and dynasties of tyrants. Tyrannies occurred in Argos, Corinth, Sicyon, Athens, other mainland states, and, toward the end of the period, in Sicily. Although, as with colonization, there were strong local causes, many tyrannies seem to have occurred because of tension between aristocratic factions or between rich and poor. A tyrant, often with a proven track record of military success and some popular support was one solution. In quite a few cases tyrants initially solved, or at least suppressed, internal conflict and, although there are exceptions, generally tended to avoid external conflict. They emphasized internal security measures to suppress opposition, and it was not uncommon for regimes to become harsher over time—especially when there was more than one generation of a tyrant in a location. This often led to internal, aristocrat-led uprisings to kill or expel tyrants. In the late sixth century, Sparta seems to have developed a deliberate policy of expelling tyrants from other states.

An alternative preventative for internal conflict was the appointment of an individual to reform the laws. Lycurgus, reputedly responsible for establishing the Spartan constitution, is an interesting example, but especially problematic. He may never have existed at all and if he did his date is quite uncertain, although some place him toward the end of the Dark Age/start of the Archaic Period. However, others are well attested, including Zaleucus of Locri in Italy (ca. 650) and Charondas of Catana and Pittacus of Mytilene (both sixth century). Perhaps the most famous of them all is Solon of Athens, whose reforms at the start of the sixth century seem designed to resolve serious internal conflict, apparently with a largely economic basis, within Athens. A slightly earlier attempt to resolve this tension, a codification of laws under Dracon, had failed—the laws were so harsh that they were described as being “written in blood” and may actually have contributed to further discontent. Solon’s reforms were not entirely successful. While they seem to have solved many of the economic issues, aristocratic faction fighting continued until the various tyrannies of Peisistratus and his sons. At the end of that century violent factional strife in Athens between two aristocrats, Isagoras and Cleisthenes, and their supporters led to Spartan military intervention which failed in the face of popular resistance. The result (ca. 506) was Cleisthenes’ suite of major

reforms which built on Solon's work to lay the basis for the famous fifth-century Athenian democracy.

In the military sphere, the Archaic Period saw the rise of the hoplite phalanx as the mainstay of mainland Greek warfare (see illustration in "Chigi Vase" entry). Although massed infantry formations predated the Archaic Period, they really came into their own during it. The hoplite, or heavy-armed infantryman, became the arm of choice during this period. The associated devolution of military service further down into Greek communities than before is probably one of the sources of tension in this period which helped lead to colonization, tyranny, and reform. This was because of the long-standing Greek view that the men responsible for the defense of a *polis* should have some say in major decisions—even if only concerning peace and war.

The hoplite became the central arm in most of Greece and was the basis of the rise (and sometimes fall) of major powers. Pheidon of Argos (ca. 720–660?) may well have (temporarily) made Argos the leading power in the Peloponnese because of his early adoption of hoplite warfare. The hoplite was certainly the basis of Sparta's sixth-century domination of the Peloponnese and the creation of its Peloponnesian League.

The early part of this period saw several traditionally attested wars which are of doubtful existence and for which we have few details. These include the First Messenian War, the Lelantine War, and the First Sacred War. Whether they actually occurred or not, they seem to preserve an early tradition of wars fought over land. This would fit with the element of population-pressure present in some of the explanations for colonization, but also with the explanation of status and honor as a motive for conflict. Better attested conflicts are the Spartan conquest and subjugation of Messenia, and Spartan conflict with Argos and Tegea. In the second half of the sixth century, Sparta used its new-found power to suppress tyrannies in neighboring areas, including expelling the Peisistratids from Athens (511–510).

In the west, toward the end of the period, interstate conflict led to the destruction of several cities, including Siris (ca. 550, or possibly ca. 570), Camarina (ca. 550), and Sybaris (ca. 510). The battle of Alalia (ca. 540) demonstrates the pressure on Greek colonies in the west from Carthage and Etruria; in a continuation of this conflict, in 524 Cumae had to fight off an Etruscan invasion.

In the east, in the mid-sixth century Cyrus the Great of Persia conquered the Ionian Greeks, laying the seeds for the Persian Wars with mainland Greece. Cyprus fell to Persia ca. 525 and ca. 512 Darius I of Persia extended his control to Thrace and the Hellespont, including the Thracian Chersonese, causing the withdrawal of Athenian colonists from the area. At the same time as the Persian threat was increasing, the main conflict in Greece revolved around the internal Athenian conflict noted above which drew in first Sparta and then Boeotia and Chalcis. Athens fought off all these threats.

The failure of the Ionian Revolt (499–493) led to the two Persian invasions of Greece in 490 and 480–479. A minority of Greek states created the Hellenic League, uniting under overall Spartan leadership (although Athens made a major contribution in the naval sphere). The Greek land victories at Marathon (490) and Plataea (479) demonstrated the superiority of Greek heavy infantry over Persian infantry that ultimately ended with Alexander the Great's conquest of the Persian Empire (334–327). The Greek naval victory at Salamis (480), and the combined land and sea victory at Mycale (479), led to Athenian domination of the Aegean for the remainder of the fifth century. At the end of the Second Persian War, Athens was established as a new major power, setting the scene for the establishment of the Delian League/Athenian Empire and major conflict with Sparta.

Classical Period (ca. 480–323)

Conflict in the Classical Period is characterized by relative Greek unity at the start, followed by intense conflict between two major powers, Athens and Sparta, at the head of two major alliance systems—the Peloponnesian League and the Delian League/Athenian Empire. Following this, the fourth century saw Thebes and a variety of other states challenge, and ultimately overthrow, Spartan hegemony. The period ended with Macedonian hegemony over Greece and Alexander the Great's conquest of the entire Persian Empire. Internal conflict, often fueled by, or fueling, external conflict, centered around the struggle for power, sometimes manifested in the competing ideologies of democracy and oligarchy. A feature of internal conflict during this period, no doubt heavily influenced by the almost endless succession of wars, is the increasing brutality of *stasis* or civil strife, and a readiness to call in external powers to intervene in domestic dispute.

In a famous passage (Document 9), Thucydides describes the bloody *stasis* in Corcyra and general breakdown in morality and law and order in Greece—both of which he ascribes to the intensity and duration of the Second Peloponnesian War (431–404).

The situation at the start of the Classical Period looked promising for reducing conflict in Greece. The Persian threat to the mainland had been removed and the victory at Mycale had signaled the Greeks going onto the offensive. Post-invasion operations were carried out by the Hellenic League, with Athens and Sparta working together to remove Persian influence in Thrace and the Hellespont. Medizers (those cities and individuals who had gone over to the Persians) were punished in Boeotia and—less successfully—in Thessaly. Success in the northeast ultimately led to the Aegean islands and Greek cities in parts of Asia Minor regaining their independence from Persia.

However, the unity was short-lived—the Spartans were never comfortable campaigning far from home because of the persistent threat of Helot revolt (a continual internal source of conflict that explains much about Spartan society and history). This, coupled with allied resentment, and then mutiny, over the Spartan Pausanias' high-handed treatment of them led to Sparta withdrawing from the anti-Persian operations and leaving the task to Athens. Although Sparta was initially willing to let Athens take the lead, the resulting Spartan/Athenian divergence over time helped cause a deterioration in relations and two wars between them, including the very destructive Second Peloponnesian War at the end of the century.

To further anti-Persian operations, Athens created a maritime alliance system, the Delian League (478/7). Initially designed to exact revenge on the Persians, the League became in turn a mechanism for freeing Greek states from Persian control and then the source of increasing power for Athens. The stunning victory over Persia at Eurymedon (ca. 467/6) gave the League naval supremacy in the Aegean and significantly reduced the need to focus on Persia—Athens increasingly now looked at the League as a means of competing with Sparta's dominance on land and achieving power in Greece. Over time, states were forced to join, or remain in, the League and contributions for its military shifted from the provision of ships and men to money. Although the allies were often pleased to provide money instead of going to the effort of providing ships and men, this practice increased

Athens' military power while reducing that of her allies. They often only realized the implications of this when considering revolt. All revolts were suppressed—often swiftly and ruthlessly—and those attempting it were reduced to the status of subject members. This transformation of the Delian League into an Athenian Empire brought vast financial resources to Athens that, for the first time in the history of Greek conflict, enabled large fleets and armies to be kept on campaign for long periods. This was matched within Athens by the total dominance of the people and democratic politicians, although oligarchic sentiment among the upper classes was never too far below the surface.

Growing tension between Athens and Sparta was kept in check for a while by the Athenian Statesman, Cimon. His “yokefellow policy” envisaged Sparta and Athens working together as the major land and sea powers to protect Greece. This foundered in 462 with Sparta's premature dismissal of Athenian forces helping them suppress a Helot revolt (sometimes called the Third Messenian War) following an earthquake ca. 465/4.

From this point, tension between Athens and Sparta increased, resulting in the First Peloponnesian War (460/59–445). This pitted Sparta and the Peloponnesian League against Athens and the Delian League, although for much of the war there were no direct military engagements between Athens and Sparta themselves. Despite early successes, Athens overreached itself during the conflict with a disastrous expedition to assist the Egyptians to revolt from Persia. In 446/5, with both sides exhausted, the Thirty Years' Peace was signed.

However, relief from conflict was only temporary. Under Pericles, Athens spent the next 20 or so years rebuilding, and strengthening its grip on its allies. Eventually, the pressure on Sparta's allies, especially maritime ones like Corinth, and Spartan concern at the rise in Athenian power, led to war again in 431—despite attempts at arbitration. Thucydides argued (1.23) that Spartan fear of Athenian power was the underlying cause (or “truest explanation”) and that what most others took to be the causes (e.g., tension over Corcyra, the revolt of Potidaea, and the Megarian decrees) were in fact triggers, not the real cause. This analysis of cause was adopted by later historians such as Polybius, and remains an influential view today. But some would disagree with Thucydides, and see Sparta's fundamental grievance—over which it was willing to fight a costly and protracted war—as Athens'

failure to acknowledge Sparta's position of leadership in the Greek world. Questions of status were never far away in ancient Greece.

The Second Peloponnesian War (431–404) was the ancient Greek equivalent of a World War. Its length and intensity unsurprisingly caused immense loss of life, heightened internal conflict in many cities, led to the professionalization of many aspects of warfare, and destroyed the Athenian Empire. Although Athens made strenuous attempts to recreate its fifth-century position, it was never fully able to do so. After a relatively short period of Spartan domination, Greece slipped into a period where several states contested for hegemony, but none was powerful enough to maintain its dominance for long. The first attempt was the Corinthian War (395–387/6); this left Sparta somewhat weakened but still in control.

One of the driving reasons for this stage of Greek conflict was the Greek ideal of *autonomia* (from which we get the modern term “autonomy”). *Autonomia* is literally the freedom of a state or group to determine its own laws, but essentially meant the ability to determine one's own future without control by others. The fourth century arguably saw an increase in the tendency to take this to its logical conclusion—that true autonomy for a city, or a group of cities united in a league, lay in controlling everyone else so they were not a threat to one's own independence. Paradoxically, this meant that *autonomia* was an ideal taken by the population of many states or leagues to apply only to themselves and not the rest of Greece. In addition, if no state—or even league—was powerful enough to really achieve this ultimate form of *autonomia*, the outcome was continual conflict. This is exactly what occurred and a side effect of this was in the attempt by various states to break the deadlock by using Persian money and/or the threat of Persian intervention to support their attempts at hegemony.

Spartan domination was ended by defeat at the hands of a Theban-led Boeotia at the battle of Leuctra in 371. The subsequent independence of Messenia permanently ended Sparta's role as a dominant power, even in the Peloponnese—although it did remain an occasionally important player. Athens' attempt to recreate the Delian League with its Second Athenian Confederacy (378/7) ended with its loss of the Social War (357–355) against several of its key allies.

Meanwhile, in Macedonia, King Philip II had fought off numerous attacks, allowing him to first rebuild and then expand Macedonian power. Over several years he extended control over the Chalcidice, the Thracian

Chersonese, and Thessaly. Interstate conflict in central and southern Greece afforded Philip the opportunity to intervene in the Third and Fourth Sacred Wars (356–346 and 340–338) and to use Macedon's superior resources and military power to establish hegemony over Greece. He achieved this with his decisive victory in the land battle of Chaeronea (338). Philip was assassinated by another Macedonian in 336 and succeeded by his son, Alexander the Great. Alexander first reestablished control, destroying the recalcitrant city of Thebes in the process, and then fulfilled a long-held panhellenic dream—the conquest of Persia.

The end of the Classical Period saw Greece for the most part united under Macedon, and Macedonian/Greek control over the old enemy, Persia. However, the death of Alexander in 323 saw the fragmentation of his empire and a whole new era of conflict between his Successors (the *diadochoi*). In the west, the conflict between local Greek cities and Carthage centered on Sicily had continued. Timoleon's stunning victory over Carthage at the Crimisus River (341) kept things quiet for a while, but the Carthaginian and Greek struggle for supremacy on Sicily remained a continual source of conflict until the Roman conquest.

While internal conflict in Greece always had specific local causes, in the fifth century it had often revolved around factions supporting Athens or Sparta, frequently with a democratic versus oligarchic ideological overlay. In the fourth century, internal conflict initially tended to revolve around pro- and anti-Spartan camps but later tended to revolve around pro- and anti-Macedonian parties.

In terms of military developments, the professionalization noted during the Second Peloponnesian War continued. Many states created standing forces of hoplites, paid for at public expense. These *epilektoi* ("chosen ones") formed the core of many armies and this helps explain why Sparta no longer had such a qualitative edge over its opponents. This, and new tactics, helped Thebes defeat Sparta in 371 and 362, but developments reached their peak under Philip and Alexander. Philip created a true combined arms army, based on the combination of an essentially professional infantry phalanx (see second illustration in Phalanx entry) equipped with *sarissae*—spears longer than the traditional hoplite weapon—and a very high quality cavalry arm. This enabled the conquest of Persia and remained a potent system until the Roman conquest in the second and first centuries. In the naval sphere, the tendency was to replace the trireme with larger ships and

to focus less on naval maneuver and more on the less technically demanding tactic of boarding (although the latter was more costly in human life for the victor).

Hellenistic Period (323–30)

The temporary unity imposed by force of Macedonian arms rapidly disintegrated on the death of Alexander the Great in 323. Attempts to preserve his dynasty, and his empire, quickly failed in the face of the ambition of his senior commanders. The wars of the Successors (*diadochoi*) dominate the first part of the Hellenistic Period, and ongoing conflict between the kingdoms they established continued to be important down to the first century. The other feature of this period is the conflict between Italian and Sicilian Greek cities and Rome and Carthage. Wars between the Sicilian Greeks and Carthage eventually brought Rome into Sicily, ultimately into Greece proper, and then into the Greek east. External conflict was largely ended by the Roman annexation of Sicily, Greece, and the Greek east and the imposition of *pax romana*. In addition to the usual local causes, broadly speaking internal conflict in this period initially tended to center around pro- and anti-Macedonian camps, then between the supporters of the various *diadochoi*, and finally around pro-and anti-Roman camps.

Conflict in Greece and the Greek east largely revolved around the *diadochoi*. The key initial players were Ptolemy (later Ptolemy I Soter) who established the Ptolemaic dynasty based in Egypt, Seleucus (later Seleucus I Nicator) who established the Seleucid dynasty based in Syria, and Antigonus and his son Demetrius (later Antigonus I Monophthalmus and Demetrius I Poliorcetes) who established the Antigonid dynasty, based on Macedonia and Asia Minor. Others of temporary importance (usually ended by their death in war) included Cassander, Lysimachus, and Eumenes of Cardia.

Once the situation had stabilized with the creation of the three main successor kingdoms based in Macedonia, Syria, and Egypt, these settled into a fairly regular pattern of conflict. Seleucid Syria and Ptolemaic Egypt, for example, fought six wars, predominantly over control of the region of Coele-Syria. In Greece itself, the Ptolemies in particular, but also the Seleucids, initially fomented unrest to destabilize Antigonus I

Monophthalmus and his successors. As a result, local conflicts soon re-emerged in Greece proper.

A decline in mainland Macedonian power for a time allowed the emergence of leagues whose combined military power far exceeded that of individual city-states in the Classical Period. The Aetolian and Achaean Leagues, for example, contested for power, generally against Macedon but occasionally with its assistance. The Achaean League became one of the leading powers in Greece for almost 150 years from the collapse of Demetrius I Poliorcetes' power in Greece ca. 288. It maintained its position by a mixture of military force and careful diplomacy—including supporting the Romans during the Second Macedonian War (200–196)—until it miscalculated and went to war with Rome in 146 (the Achaean War). The resulting short campaign ended with the sack of Corinth and the incorporation of Achaea into the Roman Empire.

The Aetolian League had a similar fate, although somewhat earlier. After some successes, the Aetolians were eventually curbed by Philip V of Macedon in the Social War (220–217). The Aetolians responded by joining Rome against Philip in the First Macedonian War (215–205). Despite doing most of Rome's fighting by proxy, the League was left empty-handed at the end of this war and its lukewarm support for Rome in the Second Macedonian War (200–196) meant that most of its post-war demands for how Rome should treat the defeated Macedon were ignored. As a result, to counter Roman influence a disgruntled Aetolia invited Antiochus II the Great, the Seleucid monarch, to invade Greece in 192. This led both to Rome's first direct involvement in the Hellenistic near east and the effective destruction of the Aetolian League's power. It became a subject ally of Rome in 189.

Rome had by now well and truly occupied the place Persia had held in the Classical Period—serving initially as the big external threat and ally that Greeks could use against their enemies. The difference was that Rome possessed real military power and from its involvement in the First Macedonian War (caused by Philip V of Macedon's alliance with Hannibal against Rome during the Second Punic War) it steadily became an increasingly important influence in Greek conflict. Rome gradually annexed Greece proper, culminating with the absorption of Macedon, Thessaly, and Epirus in 148 at the end of the Fourth Macedonian War (150–148) and then of Achaea in 146. A similar process was followed in the Greek east.

However, Rome was not the only external threat—in 279 Greece was invaded by Celts (Gauls, later called Galatians). After considerable devastation, by 277 the Greeks (largely the Aetolian League and then Antigonos II Gonatas of Macedon) eventually repelled the incursion. The Gauls, however, crossed into Asia Minor where they settled Galatia. They caused considerable local disruption, both in their own right and by serving as mercenaries for various regional dynasts, until the Romans conquered them after the battle of Magnesia (190).

But Rome remained the major threat. When Antiochus III was invited to Greece to counter Rome, his invasion force was rapidly defeated (in 191) and the Romans crossed over into Asia Minor to finish the task. Roman victory at the battle of Magnesia (190) and the resulting treaty of Apamea (188) seriously reduced Seleucid power and Rome quickly became the arbiter between the Ptolemaic and Seleucid kingdoms, often protecting Egypt from Seleucid pressure. In 133 Attalus of Pergamum died and bequeathed his kingdom to Rome, which established its first territorial foothold in the east—the province of Asia. Tigranes I of Armenia took over Syria in 83 but lost it to Rome in 69. A series of wars with Mithridates VI Eupator of Pontus (88–85, 83–82, and 74–63) also led to further Roman acquisitions. In 48 Caesar became involved in the civil war between Cleopatra VII and Ptolemy XIII in Egypt and the process was completed in 31–30 when Octavian defeated Mark Antony and Cleopatra VII at Actium and then annexed Egypt—the last of the monarchies established by the Successors of Alexander.

In the west, internal and external conflict produced a series of tyrants, such as Agathocles, particularly in Syracuse, and the continuation of an ongoing series of wars with Carthage (409–367 and 345–275). The continual struggle with Carthage eventually embroiled Sicily in the First Punic War (264–241) and then the Second Punic War (218–201) at the end of which Sicily was annexed as a Roman province.

The Hellenistic Period saw several military developments. Naval warfare, against the backdrop of a continued trend toward bigger warships, often now mounted with catapults, saw the development of lighter warships, especially the *lembos*, used for raiding the coasts and interfering with merchant shipping.

On land, there were no major new reforms, but the Macedonian-style phalanx was generally adopted across Greece. The infantry phalanx was the

dominant arm as few of the successor kingdoms were able to employ cavalry to the same deadly effect as Philip and Alexander of Macedon had. This was partly because in the east local arms and troop types were adopted—for example, chariots, archers, light cavalry, and elephants, so the Successor armies gradually took on a more eastern character. The Macedonian-style phalanx was conclusively demonstrated to be inferior to the Roman legion during the Third Macedonian War (171–168). At the hard-fought battle of Pydna (168), the phalanx was unable to succeed against the more mobile and flexible Roman maniples.

Reader Information and Abbreviations

Entries

The body of an entry is followed by two sections. “See also” directs the readers to associated entries which either provide background context or additional detail on the main topic, or to separate entries on individuals, places or events, mentioned in the entry. Where there is no possibility of confusion, the headwords in the “See also” may be abbreviated—for example, just “Archers” rather than the full “Archers (*Toxotai*)” or “Marathon, Battle of” rather than “Marathon, Battle of (480).” However, where there were two wars or battles of the same name, to aid the reader the dates are always supplied in the “See also” headword. Most of the cross references are to other entries in the Greek half of this work; where they are to the Roman section of this Encyclopedia it is clearly indicated.

“Further Reading” directs the reader to additional reading on the topic. The first part of this (if appropriate) lists the relevant ancient sources. These supply the main references for the topic, and the evidence to support any statements made in the body of the entry. (Direct quotations and paraphrased statements from an ancient author are generally given a reference at the relevant point in the body of the entry.)

The ancient works are in chronological order, which means that the source closest in time to the topic, which is usually the most useful, is listed first. However, this is not always the case; for example, Arrian is generally regarded as a better source for Alexander the Great, but as he was later than the other two main sources, Diodorus Siculus and Curtius Rufus, he is not the first listed.

The ancient references follow the standard book/chapter/section system, which is more precise than a page number in a translation and allows the

reader to check any available version of the text. Prose works, such as histories or biographies, were divided in antiquity into books, chapters, and sometimes also sections. However, in some cases short works are just divided into chapter and sections or even just chapters. For example, “Thucydides 2.27.15” or “Xenophon, *Hellenica* 4.5.12–17” mean, respectively, “Thucydides Book 2, chapter 27, section 15” and “Xenophon, *Hellenica* Book 4, chapter 5, sections 12–17.” References to poetry or drama are by line number, so “Aristophanes, *Frogs* 1123–1130” indicates “Aristophanes, *Frogs*, lines 1123–1130.”

References to ancient speeches can be by number of the speech or its title, plus the section. To avoid confusion, in this work we have listed speeches by both number and title. So, for example “Isocrates 6 (*Archidamus*) 27” indicates Isocrates’ speech number 6 titled *Archidamus*, section 27. The speech numbers are from the traditional numbering system, and unfortunately some speeches are numbered differently in other systems. So, if you are chasing up a translation and in any doubt, we suggest focusing on the title.

In the ancient source section of the “Further Reading” the authors are separated by “;”, with internal separation within an author, or between works by the same author, indicated by “.” So, “Herodotus 1.21, 23, 5.16; Thucydides 2.27, 31, 5.19; Plutarch, *Agessilaus* 12, *Pericles* 21–27” indicates “Herodotus Book 1 chapter 21 and chapter 23, Book 5 chapter 16; Thucydides Book 2 chapter 27 and chapter 31, Book 5 chapter 19; Plutarch, *Agessilaus* chapter 12 and Plutarch, *Pericles* chapters 21–27.”

The list of ancient references is followed by modern works. These are listed alphabetically and concentrate on the most important and accessible English-language works on the topic. Non-English works are only listed where they are the most important work on the topic and/or there is no appropriate English-language work on the topic.

Greek Words and Names—Pronunciation and Spelling

There is no one correct way to pronounce Greek names. Pronunciation is generally a compromise between attempting to pronounce it as an ancient Greek would have and coming up with an anglicized version which is a bit easier. The main rules to remember are that all vowels are pronounced (so, for example, Perikles = “Periklees”), and that generally C, CH, and G are

pronounced “hard” (as in “come,” “Murdoch” and “go”), but that it is conventional to pronounce TH like English “th” (as in “thing”) and PH like the English “f” (as in “photo”), although in reality both these pronunciations were only adopted in late antiquity.

There are several ways of rendering Greek words and names. One method is to anglicize the word or name, usually by dropping its ending (e.g., Athens, Corinth, Peloponnese). The tendency for the past 50 or so years has been to use a simple transliteration of the original Greek. Prior to that, and still in common use, the practice was to render Greek words and names into English using their latinized form. For example, Greek has no letter “c” and uses “ai” where Latin has “ae.” The Latin endings for many names are “us,” “o,” or “um” while the equivalent Greek endings are “os,” “o-n,” and “on.” This means that the transliterated and latinized systems have differences, sometimes significant. Examples are: “Alkibiades” and “Alcibiades”; “Peisistratidai” and “Peisistratidae”; “Parmenion” and “Parmenio”; “Hipparkhos” and “Hipparchus”; and “Kounaxa” and “Cunaxa.”

For names, the traditional system is generally the most familiar to the general reader and a strict system of transliteration can produce some very unfamiliar looking forms (e.g., “Aiskhylos,” “Akhilleus,” and “Ploutarkhos” for the more familiar “Aeschylus,” “Achilles,” and “Plutarch”). This work therefore uses the traditional Latinized system for names.

For Greek terms that are likely to be new or less familiar to the reader, we have generally used the transliterated system (e.g., *ekdromos* not *ecdromus* for a soldier who runs out from a battle line). In the text, transliterated Greek words (except for proper names) are denoted by italics. However, even this can occasionally appear inconsistent to the non-Greek speaker. For example, the Greek term for a “hoplite” or heavy infantryman is *hoplites*, which looks the same as the English plural of hoplite. (The Greek plural is *hoplitai*.)

The main practical effect for the reader is that if you are looking up a Greek name you have come across elsewhere which starts with “K” (e.g., “Kleon”) you will find it under “C” (e.g., “Cleon”). In most other cases it should be reasonably apparent that, for example, “Hiero” and “Hieron,” refer to the same man, as do “Dionysius” and “Dionysios,” and “Antigonus” and “Antigonos.” However, the table titled “Spelling of Greek Names” will provide further assistance to the reader in this area.

Spelling of Greek Names

Dates and Dating

All dates in the entries in the Greek section are BCE (Before the Common Era) unless otherwise indicated as CE (Common Era). This is a relatively new system, replacing the traditional BC (Before Christ) and AD (*Anno Domini*, “[in the] Year of our Lord”). In terms of the dating, “BCE” exactly equates to “BC” and “CE” to “AD.” Although becoming more widespread, the new system has not been universally accepted by ancient historians. This means that many of the titles of works in the “Further Reading” listed for the entries and in the Bibliography use the earlier BC/AD system.

Dating is a perennial problem in ancient Greek history, and in general the earlier the date the less secure it is. This is because of the lack of detailed record keeping and the fact that different cities used different calendars. The lunar cycle was used in ancient Greece, which from time to time required omitting dates—or adding extra dates—to bring it into line with the solar cycle. With some exceptions, unless for example linked to an eclipse or some other absolutely datable occurrence, it is almost always very difficult to establish an exact date for a specific event. Often the best achievable is a season (or sometimes month) and year (e.g., “summer 418”).

This is compounded by the different local dating systems. Although

some commonality could be achieved by dating using Olympic years, most states used a system based on a particular office holder, or the year in a monarch's reign. The latter was presumably used at Sparta from early times and it became more widespread in the Hellenistic Period with the proliferation of monarchies after Alexander the Great.

In Athens, for example, the year was dated by the name of the chief *archon* or magistrate, sometimes referred to by historians as the "eponymous *archon*" (i.e., the magistrate who gave his name to the year). So, an event could be described as occurring "in the year of Chares" or "the year of Philocrates." However, the official year often did not coincide with the calendar year—at Athens it began in the month Hekatombaion (usually mid-summer) and ended in Skirophorion the following year. This means that an archon-year date in an ancient Greek source could indicate a date in either of two years in our modern system. These dates are traditionally given in the following form: 480/79 or 432/1 and this is the system used in the Greek section of this work. Where a date is given as 480–79 or 432–28, this indicates a span of time.

Ancient Greek history is traditionally divided into several broad periods. Agreement is not universal on their dates as start and end points are approximate, but they are useful shorthand aids to broad dating. Noting that in most cases start and end dates are approximate only, the following apply in this work:

Mycenaean Period:	ca. 1600–1100
Dark Age:	ca. 1100–700
Archaic Period:	ca. 700–480
Classical Period:	ca. 480–323
Hellenistic Period:	323–30

Greek history prior to the Dark Age is also commonly called the "Bronze Age" and further divided into Early, Middle, and Late Bronze Age, with subdivisions in each of these categories. However, these vary from region to region (e.g., mainland Greece, the Cyclades, and Crete) and are relative chronologies (i.e., they show a sequence but not fixed or absolute dates)—often based on pottery.

The broader terms Early, Middle, and Late Bronze Age are occasionally used in the entries and for mainland Greece they are roughly as follows:

Early Bronze Age:	ca. 3200–2000
Middle Bronze Age:	ca. 2000–1600
Late Bronze Age:	ca. 1600–1100 (equates to the ‘Mycenaean Period’ used in this Encyclopedia)

Another term readers might encounter is the “Early Iron Age”—this equates to the “Dark Age” used in this Encyclopedia (ca. 1100–700).

Hellenistic Rulers

In ancient Greece an epithet or nickname was frequently used to distinguish between monarchs of the same name. This was necessary as some dynasties (as some monarchies do today) used a limited range of names. As in more modern times, a numbering system was also used. Confusingly, the monarchs of Hellenistic Greece can be referred to by either system, and this can be compounded when an epithet such as “Euergetes” is given in translation—in this case “Benefactor.” So, the third king in the Ptolemaic dynasty of Egypt can appear as “Ptolemy III,” “Ptolemy Euergetes,” or “Ptolemy the Benefactor.” To avoid confusion, the Greek section of this Encyclopedia uses both number and epithet for Hellenistic monarchs, so Ptolemy in the above example appears as “Ptolemy III Euergetes.” There is a further issue with the first member, or sometimes the first two members, of those dynasties created by the *diadochoi*, or Alexander the Great’s Successors. The first of these proclaimed themselves kings in ca. 306/5—before that they were simply known by name or by name and epithet. To avoid confusion this Encyclopedia refers to the first generation of kings, the Antigonids Antigonus I Monophthalmus and Demetrius I Poliorcetes and the founders of the Seleucid and Ptolemaic dynasties, Seleucus I Nicator and Ptolemy I Soter, by their full royal title even for the period before they crowned themselves.

Measurements

Individual Greek states used different measurement systems, which sometimes makes accurate conversions difficult. Where measurements in

the entries appear as both imperial and metric, the figure in brackets is often rounded to the nearest whole number.

Abbreviations

The following abbreviations are used in the entries in the Greek section of this Encyclopedia.

-
- Aelian**, *Tactics* (*On the Military Arrangements of the Greeks*)
- Aeneas Tacticus**, *On Sieges*
- Appian**, *Roman History* (NB in some editions/translations, Book 9 is referred to as the *Macedonian Wars*, Book 11 as the *Syrian Wars*, and Book 12 the *Mithridatic Wars*)
- Arrian**, *Anabasis/Indica* (NB *Indica* is Book 8, but in some editions/translations appears as a separate work)

Chronology of Conflict in Ancient Greece

The following chronology lists major events in Greek military conflict. An asterisk (*) is used to mark the names of people and events with entries in the body of the work. Names of places which have an entry are *not* asterisked. In the entries, battles are listed alphabetically under the name of the battle, not under “battle” (e.g., “Marathon, Battle of”). Series of wars are listed by the name of the war not by the number (e.g., “Messenian War, First”). All dates in the chronology are BC/BCE.

ca. 745	Greek migrations overseas; a major wave of colonization begins
ca. 736–716	*First Messenian War (traditional date)
ca. 700	*Lelantine War (traditional date)
ca. 669	*Battle of Hysiae between Argos and Sparta
ca. 660	First recorded major Greek sea battle, between Corinth and Corcyra (*Corcyra and Corinth, Sea-Battle)
ca. 650–630	*Second Messenian War (traditional date)
ca. 632	Cylon’s unsuccessful coup at Athens
ca. 595–590	*First Sacred War (traditional date)
ca. 570	Egypt gains control of Cyprus War between Sparta and Tegea (*Sparta, Attack on Tegea [Fetters, Battle of])
ca. 561/60	First tyranny of *Peisistratus (Athens)

ca. 559–556	*Miltiades I establishes Athenian control in the Thracian Chersonese (Gallipoli Peninsula)
ca. 556/5	*Peisistratus' tyranny ended, followed by his second (short-lived) tyranny
ca. 550	Croton, Metapontum, and Sybaris together destroy Siris (possibly ca. 570)
ca. 547	Syracuse destroys Camarina *Battle of the Champions between Argos and Sparta Lydia incorporated into the *Persian (Achaemenid) Empire
ca. 546	*Cyrus the II of Persia conquers the Ionian Greeks
ca. 545	Third tyranny of *Peisistratus (Athens)
ca. 540	*Battle of Alalia (Corsica), between Carthage, Etruria, Phocaea, and Massilia
528/7	Death of *Peisistratus
ca. 525	Persia gains control of Cyprus and Cyrene
524	Cumae defeats Etruscan invaders
ca. 519	Athens assists Plataea against Thebes (*Athens, External Conflicts [519–506])
ca. 512	*Darius I of Persia conquers Thrace and the Hellespont
511–510	Spartan expeditions against the *Peisistratidae of Athens (*Athens, External Conflicts [519–506])
ca. 510	Croton destroys Sybaris
508/7	Athenian power struggle between *Cleisthenes and Isagoras (*Athens, External Conflicts [519–506])
ca. 506	Reforms of *Cleisthenes at Athens;

	conflict with Sparta, Thebes and Chalcis (*Athens, External Conflicts [519–506])
ca. 505	Aristodemus, tyrant of Cumae, defeats Etruscans at Aricia
ca. 500	Persian expedition fails to take Naxos *War between Athens and Aegina (intermittently fought down to 457)
499–493	*Ionian Revolt against Persia
494	*Battle of Lade between Ionians and Persians Sack of Miletus (*Miletus, Siege of) *Battle of Sepeia between Sparta and Argos
493	*Ionian Revolt ends in failure
492	Persia establishes control over Thrace, Thasos, and Macedon
491	Persian embassies demand the submission of Greek states (*Persian Wars) *Gelon becomes tyrant of Gela (Sicily)
490	Persia invades Greece by sea (*Persian Wars) Siege and destruction of Eretria Persians defeated at the *battle of Marathon
ca. 489	*Miltiades II leads Athenian naval expedition to the Cyclades, but dies from wounds received at Paros
487	Egypt revolts against Persia
486	*Darius I of Persia dies and is succeeded by *Xerxes I
485	*Gelon becomes tyrant of Syracuse
484	Babylon revolts against Persia
ca. 483	Athens expands navy. Persians prepare to invade Greece

482	* Aristides ostracized
481	Greeks meet at the Isthmus of Corinth to discuss resistance to Persia (*Hellenic League [against Persians], *Persian Wars)
480	*Persian War: Persia invades Greece *Battle of Thermopylae (Greek loss) *Battle of Artemisium (draw) Persians sack Athens Greeks defeat Persian navy at the *battle of Salamis Carthage invades Sicily (*Carthaginian War, First)
479	Greeks defeat Persians at the *battle of Plataea Greeks defeat Persians at the *battle of Mycale
479/8	Rebuilding of Athens' city walls
478	Combined Greek expedition against Persians in Cyprus and Byzantium
478/7	Foundation of the *Delian League
476/5	*Pausanias (son of Cleombrotus) recalled to Sparta in disgrace *Cimon leads the Greek campaign against Persians in Thrace
474	*Hieron I and Cumae defeat Etruscans in a naval battle off Cumae
ca. 471	*Themistocles ostracized
ca. 470–469	War between Sparta and Argos
ca. 468/7	*Delian League crushes revolt of Naxos (*Athens, Revolts of Allies)
ca. 467/6	Athenian land/naval victory over Persia at *Eurymedon
ca. 465	Thasos revolts from *Delian League and is besieged Destruction of Athenian colonizing expedition at Drabescus in Thrace

	(near Amphipolis)
ca. 465–456	*Third Messenian War
ca. 465/4	Earthquake at Sparta, *Helots revolt, siege of Ithôme (*Third Messenian War)
ca. 463/2	Thasos surrenders to *Delian League Egypt revolts against Persia (perhaps on death of Xerxes, 465)
462	Athenian force under *Cimon helping Sparta against *Helots is sent home early (*Third Messenian War) Constitutional reforms of Ephialtes (Athens)
ca. 462/1	Athens allies with Argos and Thessaly
461	Ostracism of *Cimon and murder of Ephialtes in Athens
ca. 460	Death of *Themistocles
460	Athens sends force to help Egypt (*Athens, intervention in Egypt) Death of Themistocles Athens allies with Megara and builds Long Walls there
460/59–445	*Peloponnesian War, First
459	Athenian/Delian League fleet captures Memphis (Egypt)

Antipater (399/8–319)
Antiphon (ca. 480–410)
Aratus of Sicyon (271–213)
Archelaus (d. 399)
Archidamus II (d. ca. 427/6)
Archidamus III (ca. 400–338)
Archimedes (ca. 287–212)
Aristagoras (Late Sixth–Early Fifth Century)
Aristides (d. post-467)
Aristonicus (d. ca. 129)
Artaxerxes I (Reigned 465–424)
Artaxerxes II (Reigned 405/4–359/8)
Artaxerxes III (Reigned 358–338)
Artemisia (Active ca. 480)
Astyochus (Active 412/11)
Attalus I of Pergamum (Reigned 241–197)
Attalus II of Pergamum (Reigned 159–138)
Attalus III of Pergamum (Reigned 138–133)
Brasidas (d. 422)
Brennus (d. 278)
Callicrates (d. 149/8)
Callicratidas (d. 406)

Callisthenes of Olynthus (d. ca. 327)
Cassander (d. 297)
Cersobleptes (Reigned ca. 360–342)
Chabrias (ca. 420–357)
Chares (Active ca. 367–325)
Charidemus (d. 333)
Cheirisophus (ca. 440–400)
Chremonides (Active 270–240)
Cimon (ca. 510–449)
Clearchus (ca. 450–401)
Cleisthenes (ca. 570–after ca. 506)
Cleisthenes of Sicyon (Ruled ca. 600–560)
Cleitus (the Admiral) (d. 318)
Cleitus the Black (d. 328)
Cleombrotus I (Reigned 380–371)
Cleomenes I (Reigned ca. 520–ca. 490)
Cleomenes III (Reigned ca. 235–222)
Cleon (d. 422)
Cleopatra VII (69–30)
Coenus (d. 326)
Conon (ca. 444–392)
Cotys (d. 359)
Craterus (d. 321)
Croesus of Lydia (ca. 595–547)
Cypselus (d. ca. 625)
Cyrus II (Reigned 559–530)
Cyrus the Younger (ca. 423–401)
Darius I (Reigned 522–486)
Darius II (Reigned 423–404)
Darius III (Reigned 336/5–330)
Demaratus (Reigned ca. 515–491)
Demetrius I of Bactria (Reigned ca. 200–180)
Demetrius I Poliorcetes (ca. 336–282)
Demetrius II Nicator (ca. 160–125)
Demetrius of Phalerum (ca. 350–280)
Demetrius of Pharos (Active ca. 230–215)
Demosthenes (General) (d. 413)
Demosthenes (Orator) (ca. 384–322)
Dercylidas (d. after 387)
Diodotus I and II of Bactria (ca. 300–ca. 230)

Dion of Syracuse (ca. 409–354)
Dionysius I of Syracuse (ca. 432–367)
Dionysius II of Syracuse (Reigned 367–357 and 346–344)
Dorieus (ca. 540–505)
Epaminondas (d. 362)
Ephialtes, Malian (Active ca. 480)
Eucratides the Great (Reigned ca. 170–145)
Eumenes I of Pergamum (Reigned 263–241)
Eumenes II of Pergamum (Reigned 197–159)
Eumenes of Cardia (ca. 361–316)
Eurybiades (Active ca. 480)
Eurydice (d. 317)
Euthydemus I of Bactria (Reigned ca. 230–200)
Evagoras (ca. 435–374/3)
Gelon (Reigned ca. 491–478)
Gylippus (d. after 403)
Harpalus (d. 323)
Hephaestion (d. 324)
Hermocrates of Syracuse (d. 407)
Hero of Alexandria (ca. 10–ca. 70 CE)

A

Abdera

Abdera was originally a Clazomenian colony, founded in the mid-seventh century on the Thracian coast, almost opposite the island of Thasos. Known for its grain and as an access port for trade with Thrace, Abdera's prosperity dates from its refounding by the inhabitants of Teos who relocated there in 544 to avoid Persian rule.

Abdera was taken by the Persians in 513/12 and again in 492 and joined the Delian League after the Second Persian War. After initial success against the Triballi in 376, Abdera suffered major losses in an ambush. Saved by the Athenian Chabrias, the city joined the Second Athenian Confederacy. Attacked by Philip (ca. 352), Abdera later (late 340s?) came under his control. These successive setbacks caused a decline in Abdera's importance; it was subsequently taken by Lysimachus, the Seleucids, and the Ptolemies and (in 170) by the Romans and Eumenes II of Pergamum.

Abydus

Abydus (located near modern Canakkale) was a Milesian colony, founded in the late eighth/early seventh century. It was strategically located on the Asian side of the narrowest part of the Hellespont (the Dardanelles) and became the usual military transit point between Asia and Europe. In 480, Xerxes invaded Europe across a temporary bridge built from Abydus to the vicinity of Sestos on the European side. Later, armies were ferried across the strait at this point by ships, as, for example by Agesilaus in 394, Alexander in 334, Lysimachus in 301, and Seleucus in 281.

After the Second Persian War, Abydus joined the Delian League. Its location was important to Athenian control of the vital grain route from the Black Sea and when the city revolted from Athens in 411 (during the Peloponnesian War of 431–404), it became a focal point of campaigning in the region. Athenian naval victories at Cynossema and, later in 411, Abydus, and a land victory outside the city in 409 failed to detach Abydus from the Peloponnesian alliance.

In the Corinthian War (395–387/6), Abydus was the only city in the Hellespont region that remained loyal to Sparta after the battle of Cnidus (394). The Spartan commander Dercylidas rallied there the Spartan governors expelled from other cities in Asia Minor and continued resistance until replaced by Anaxibius in about 390. Around 389/8, Iphicrates carried out a highly successful ambush of Anaxibius' forces, killing him, but Abydus remained the key port for Spartan naval forces when in 388 with Persian help they trapped the Athenian fleet inside the Hellespont and ended the Corinthian War.

Abydus' strategic position saw its return to Persian control in 387/6 and entered by Alexander the Great in 334. Philip V of Macedon captured the city, by then heavily fortified, in a bitterly contested siege in 200, contributing to war with Rome (the Second Macedonian War). Later (192/1), Antiochus III the Great refortified the city as a precaution against a Roman invasion, although in the end he did not oppose the crossing.

Acarnania, Acarnanians

The region of Acarnania was located in northwestern Greece on the coasts of the Ambracian Gulf and the Ionian Sea, with the Achelous River forming its eastern boundary with Aetolia. Acarnania had developed into a federal state with its capital at Stratus by the fifth century. Corinthian colonies on the coast (e.g., Ambracia, Anactorium, and Leucas) were outside of this federation and often hostile to it. Thucydides commented that in his time (ca. 450–395) Acarnania was one of the backward regions that preserved the old practices that had vanished from the more civilized parts of Greece, such as raiding neighbors and carrying weapons in everyday life.

Acarnania was an ally of Athens during the Peloponnesian War and with Athenian help, and especially the skillful leadership of the Athenian general Demosthenes, was able to defeat an invasion by a Spartan-led force (426). In the Corinthian War (395–387/6), Acarnania was allied with Athens but successive attacks by Agesilaus (about 390–389) forced it to submit to Sparta. In 375, Acarnania joined the Second Athenian League and remained an ally of Athens down to the battle of Chaeronea in 338.

From then on Acarnania was dominated by Macedonia and by its neighbors, Aetolia to the east and Epirus to the north. In 314, Cassander induced the Acarnanians to coalesce into larger urban centers, of which Stratus became the most populous. Constant conflict over border territories led to the partition of Acarnania by Aetolia and Epirus in about 250. When the Epirote monarchy collapsed in about 230, the northern portion of Acarnania regained its independence and established a new federal state with its capital at Leucas. Acarnania was an ally of the Macedonian king Philip V in his second war against Rome (200–196). After his defeat Acarnania was partitioned, with its new capital at Thyrraeum, and became a dependent of Rome. After 146, Acarnania was part of the Roman province of Achaëa.

Achaea, Achaeans

Homer's *Iliad* frequently uses the term “Achaeans” to mean the Greeks as a whole, and there are two regions in Greece with that name. The less important was in southern Thessaly and called Achaea Phthiotis (Phthiotic Achaea). The more important, and the subject of this article, was Achaea in the northern part of the Peloponnese. It was bounded to the north by the Corinthian Gulf, Sicyon on the east, the Larissos River to the west, and to the south the Erymanthus and Cyllene ranges, which formed the boundary with Arcadia. Apart from plains in the east or the coastal strip, the region is largely hilly or mountainous. The region (and the original Achaean League) comprised 12 cities, with a common sanctuary to Poseidon at Helice. However, after Helice disappeared into the sea during an earthquake in 373, the League body generally met at Aegium.

Despite its fame in Homer, Achaea was not particularly important until the Achaean League was restored in the third century and accepted other Peloponnesian cities into its ranks. It was a minor participant in colonization, focusing on South Italy (Sybaris, Croton, Caulonia, Metapontum, and Poseidonia) and stayed neutral during the Persian Wars.

Like the rest of the Peloponnese, the main Achaean troop type was the hoplite, although as might be expected from a predominantly mountainous country, the area also produced *psiloi* (light troops). Until the third century, Achaea generally aligned itself with Sparta, although it was allied to Athens for a while in the mid-fifth century and with Boeotia in the mid-fourth. The region was forcibly brought into the Roman Empire in 146.

Achaea Phthiotis

Achaea Phthiotis was an area south of Thessaly, constituting Mount Othrys together with areas to the east (along the Gulf of Pagasae) and the south (on the Malian Gulf). It should not be confused with Achaea, in the northern Peloponnese, or Phthiotis, one of the subdivisions of Thessaly proper. Its major cities were Larisa Cremaste in the south (to be distinguished from Larissa in Thessaly), Melitaea, Halos, and Phthiotic Thebes in the north (not to be confused with Thebes in Boeotia).

The Achaeans of Phthiotis formed one of the member *ethne* (tribes) of the Delphic Amphictyony, but for much of their history seem to have been in some form of dependent relationship with the Thessalians to the north. With the Perrhaebians and Magnesians, the Achaeans were often grouped as Thessalian *perioikoi* (dwellers around). With the Thessalians, the Achaeans medized in 480, and Xerxes' army passed through the area. In 363, however, Achaea broke away from Thessaly and allied with Boeotia. Achaeans of Phthiotis fought for Alexander, but all except Phthiotic Thebes joined the Greek alliance against Macedonia in the Lamian War. For much of the Hellenistic Period, the area was part of the Aetolian League. In 196, the Romans declared Achaea free and incorporated it into Thessaly.

Achaean League

The term “Achaean League” applies to two distinct phases in the history of the state of this name. In the first, during the Classical Period, the Achaean League (also known as the Achaean Confederacy) was a federal state consisting of only the 12 cities of Achaea on the northern coast of the Peloponnese. In the second phase, during the Hellenistic Period from 281/80 to 146, the Achaean League extended its membership beyond the boundaries of Achaea proper in an important new extension of the principle of federalism. This wider Achaean League became the leading power in Greece down to 146.

The Achaean League is first mentioned (Thucydides 1.115) as an ally of Athens in about 453. In the Thirty Years Peace (446/5) it was left neutral. By the outbreak of the Peloponnesian War (431), only one city, Pellene, had joined Sparta but the rest soon followed. Achaea remained in alliance with Sparta throughout the Peloponnesian War (431–404) and the Corinthian War (395–387/6). Its loyalty to Sparta persisted even after Sparta’s defeat at Leuctra (371) but during the third Boeotian invasion of the Peloponnese in 366 Epaminondas persuaded the ruling oligarchy to break with Sparta and enter into alliance with Boeotia as an autonomous state keeping its own oligarchic institutions. However, Boeotia overturned his policy and expelled by force the ruling elites, replacing them in power with pro-Boeotian democracies supported by Boeotian governors (“harmosts”). Internal conflict followed and by the late 360s Achaea was back in alliance with Sparta.

In the second part of the fourth century, Achaea seems to have followed a policy of prudent neutrality as far as possible but there is little evidence for its activities at this time. At some point, the federal organization

disintegrated. In 281/80, the federation was revived and, exploiting the confused situation left by the collapse of Demetrius I Poliorcetes' power in Greece, Achaëa took the important step of incorporating into the League other cities in the Peloponnese. Crucial leadership was provided by Aratus, a statesman from Sicyon, the first city to join the extended Achaean League. At first, the League opposed Macedonian imperialism in the Peloponnese but in 224, it allied with Antigonos III Doson to defeat the threat from a resurgent Sparta under King Cleomenes III.

In return for Macedonian help against Aetolia and other enemies, the League remained loyal to Macedonia in its first war with Rome (215–205). In 198, during the Second Macedonian War (200–196), under strong pressure the League joined Rome, with which it soon had a formal treaty of alliance. Support for Rome against Antiochus III and Perseus at first brought further Roman favor. Under the leadership of Philopoemen, the League had expanded to include the whole of the Peloponnese, including the former enemies Sparta, Messenia, and Elis. Increasing friction with Rome led, immediately after the defeat of Perseus, to a split and Rome ordered the deportation to Italy of 1,000 upper class hostages, who were not returned till 151. Callicrates led the League in a policy of increasing subservience to Rome but anti-Roman feeling grew. In 149, when the League attempted to reverse the defection of Sparta, Rome ordered it to allow independence to Sparta and also Argos and Corinth, which did not want it. In the resulting war with Rome (the Achaean War, 146), the League forces were easily defeated and Roman troops sacked and razed Corinth.

The historian Polybius (one of the 1,000 hostages) wrote with enthusiasm about the League's policies and institutions, taking too lenient a view of its failings and not confronting adequately some of its weaknesses. These included the ban on holding the supreme federal office of general (*strategos*) for more than one year at a time and the limitation of the supreme governing body, a combined council and assembly, to four regular meetings a year. In other respects, the Achaean League was a carefully worked-out compromise between a centralized authority and internal autonomy for the constituent cities. Federal laws prevailed throughout the League over the law of individual cities. The League had uniform weights and measures. Its principal federal silver coinage was minted in individual cities on a uniform weight-standard and pattern, with each city adding its own monogram to the federal monogram on the reverse. The Achaean

League has been regarded as the best solution devised in ancient Greece to the problems of particularism and endemic conflict.

Achaean League, Wars of

The history of the Achaean League (also known as the Achaean Confederacy) is rather patchy and so is the evidence for its major wars. This is compounded by the fact that it is sometimes difficult to tell if the League or individual Achaean states had committed the troops. The evidence at other times, though, is good, especially during its third century high point under leaders such as Aratus, Lydiadas, and Philopoemen—extensively covered in both Polybius and Plutarch. Never strong enough on its own to dominate Greece, Achaean League wars were initially (and generally) coalition wars, characterized for much of the fifth and fourth centuries by alliance with Sparta and the Peloponnesian league.

A short flirtation with a Boeotian alliance in the mid-fourth century was replaced by an apparent policy of neutrality (although the evidence for this period is limited) that continued when the League dissolved sometime in the second half of the fourth century. When the League was refounded in the early third century, its wars were characterized initially by an anti-Macedonian stance, later reversed to meet the threat of a resurgent Sparta. The Achaean League fought as a Macedonian ally until the Second Macedonian War (200–196), after which it was an ally of Rome. Although Rome supported the League's extension of control in the Peloponnese

through a series of local conflicts, a falling out with Rome led to its defeat (146) in the Achaean War, Roman control, and the end of independent League military action.

Earlier, in the fifth century, the League was allied to Athens ca. 453, when Achaean troops serving under Pericles fought at Sicyon and in Acarnania. Little else is known of their activities in the First Peloponnesian War (460/59–445). Apparently neutral after the war, the League allied with Sparta in the Second Peloponnesian War (431–404) but apparently played a minor role. The Achaeans also fought on the Spartan side during the Corinthian War (395–387/6), including at the battle of Nemea (394). Sometime before 389 the Achaeans had seized Calydon and in that year threatened to leave the alliance unless Sparta helped in their campaign against the Acarnanians and their Athenian and Boeotian allies. The Achaeans clearly wanted to achieve control over Acarnania and were not happy that, despite a major victory, Agesilaus and the Achaeans did not capture a single Acarnanian city.

Achaeans served in the Spartan fleet near Corcyra (373/2) and contributed troops before and after the defeat at Leuctra (371). In 366, with Sparta largely neutralized and threatened by Boeotian invasion, the League allied with the Boeotian League. In the mid-360s, the Achaeans successfully helped Elis resist the Arcadians and fought as part of the anti-Boeotian coalition at Mantinea (362). The Achaean League supported the Phocians with troops during the Third Sacred War (356–346) and for the remainder of the fourth century took an anti-Macedonian stance. In 338, as part of the Greek coalition Philip II heavily defeated them at Chaeronea, and in 331 they joined Agis III's unsuccessful revolt against Macedon. Unsurprisingly, given Macedonian domination, there is no record of independent Achaean military activity until after the League was revived in 281/80.

The third century was the high point of Achaean League power and it fought several wars, often simultaneously. It expelled Macedonian garrisons and asserted its independence between 281 and 275. In 251, Sicyon joined the League and Aratus of Sicyon became one of its most famous generals. In succession, Corinth (243), Megalopolis (235), and Argos (229) were brought in, increasing the League's wealth and the size of its army. The capture of Corinth (attacked with no declaration of war) seriously damaged Macedonian influence in the Peloponnese and in 241 Aratus heavily defeated the invading Aetolian League army. Antigonos II Gonatas made

peace with the Achaeans. Only a couple of years later, the two Leagues (temporarily) allied against Gonatas' successor, Demetrius II (Nicator) in a war that dragged on until his death in 229. Their alliance effectively constrained Demetrius, but in 233 Aratus was defeated by Macedon at Phylacia but Demetrius was distracted by events elsewhere. Demetrius' death in battle against the Dardanians ended the war, but the Achaeans meanwhile had been dragged into a war against Illyria (ended by Rome in 228).

Despite Aratus' successes, when the League started a war against Sparta (229), it underestimated the degree to which Cleomenes III had reinvigorated Sparta. Raided in 229, the League lost two major battles in 227 and in 226 and, with Argos defeated and Corinth besieged, was in serious trouble. Aratus called in Antigonos III Doson and after a further setback at Megalopolis (223), Cleomenes was defeated at Sellasia (222).

League influence in the Peloponnese was curtailed by its defeats prior to Sellasia and the renewed Macedonian presence after it. However, again assisted by Macedon (under Philip V), the League fought the Second Social War (220–217) against the Aetolian League, Elis, and Sparta. The Aetolians were defeated, largely because of energetic Macedonian efforts, but the Achaean League ultimately gained the benefits when Philip V was drawn into conflict with Rome and soundly defeated in the Second Macedonian War (200–196). Although the First Macedonian War (215–205) was fought by proxy with no combat between Macedon and Rome, Achaea was allied with Philip and did contribute troops against Rome's allies, the Aetolian League.

Following the Second Macedonian War, Achaea became the dominant power in the Peloponnese, although careful to maintain good relations with Rome. For example, the Achaean League committed troops to assist the Romans put down the pretender Andriscus in the Fourth Macedonian War (150–148). Ironically, the final war of an independent Achaean League was its revolt against, and fairly swift defeat by, Rome (146). The League went to war over a Roman decision to allow Sparta to leave the League, and to make Corinth and Argos independent. The League's forces were simply no match for the Romans and although the League was probably reconstituted in some form soon afterward, no further independent military action is known.

Achaean War (146)

Causes

The Achaean War arose from a combination of Roman attempts to rein in Achaean League aggression, particularly against a recalcitrant member state of the League, Sparta, and the League's falling under the sway of anti-Roman politicians.

In 150, the Achaean politician Diaeus of Athens forced Sparta to sentence 24 men of Diaeus' choosing to death. The condemned men went into exile in Italy and complained to the Roman Senate. Diaeus and Callicrates of Leontium responded to the Spartan complaints but were dismissed by the senators, who told them to await their decision by return embassy. The embassy was not dispatched until over a year later. In the meantime, Sparta detached itself from the Achaean League, and despite calls by Quintus Caecilius Metellus, the consul in charge of Macedonia, for the preservation of peace, the Achaeans tried to force Sparta back into the confederacy. Several Roman embassies followed between summer 147 and spring 146. Of these, one led by Lucius Aurelius Orestes (consul 157), barely escaped violation after it mandated the detachment of Sparta and other cities from the league. Another, led by Sextus Julius Caesar (consul 157),

was insulted by the anti-Roman League *strategos*, Critolaus of Athens, who told Caesar that a final settlement with Sparta would have to await the regularly scheduled League meeting six months hence.

Further attempts by Metellus to resolve the situation peacefully followed. He dispatched another embassy to the League, meeting at Corinth, in spring 146. The Romans addressed the Achaeans courteously but were shouted down and driven from the city. Critolaus harangued the assembly into voting for war, nominally against Sparta, but actually against Rome.

Course

The new Roman consul, Lucius Mummius, arrived soon afterward. The Romans defeated the Achaeans at Scarphea, where Critolaus was killed. Diaeus was then defeated at Chaeronea in Boeotia. He armed slaves and levied special taxes throughout Achaea, and assembled his forces at Corinth. Following a successful Achaean night attack on the Roman camp outside the walls of Corinth, Diaeus was emboldened to offer battle. The Achaean cavalry fled before the battle began, but the infantry held off the Roman legions for a while, before succumbing to a flanking attack by 1,000 picked Roman infantry. Diaeus fled to Arcadia with his family and committed suicide. Corinth, now defenseless, was sacked and razed by the Romans; all the surviving Corinthian males were executed, and the women and children were sold into slavery.

Consequences

In the settlement that followed, the Achaean League was dismantled. It lived on as a purely religious association, or *koinon*, but its political importance was at an end.

Achaeus (ca. 250–213)

Achaeus was the son of Andromachus, who was a relative of King Seleucus III (reigned 225–223) and served him as general. Andromachus was captured in a war (225/224) against Attalus I of Pergamum, who was in alliance with King Ptolemy III of Egypt. When Seleucus III himself was assassinated on campaign in Asia Minor, Achaeus took command of the army and loyally ensured the succession of Seleucus' young son, Antiochus III (reigned 223–187). Appointed viceroy of Asia Minor, Achaeus successfully continued the war against Attalus, whom he defeated and besieged in his capital (222–221).

At this point, Achaeus was persuaded to rebel by Molon, a rebel in the Seleucid territories in Mesopotamia, and by King Ptolemy III, who held Achaeus' father as a hostage. Achaeus declared himself king, issuing coinage in his own name. He marched on the Seleucid capital Antioch but his troops refused to fight against the army of the legitimate king, Antiochus III. This diversion enabled Attalus to regain the ground he had earlier lost to Achaeus.

After this failure, Achaeus maintained himself in Asia Minor. Antiochus was able to mount an attack against him only after he had suppressed Molon and ended a conflict with Egypt (the Fourth Syrian-Egyptian War, 221–217). Antiochus ensured Attalus' neutrality and out-generalled Achaeus. Achaeus was driven into his capital Sardis and besieged there for two years. Antiochus eventually penetrated the steep hill fortifications of Sardis by using troops from the mountains of Crete. Achaeus was caught attempting to escape and executed with extreme brutality (213).

Achaeus' rebellion is another illustration of the insecure Seleucid hold on Asia Minor and the lack of enduring family loyalty in the dynasty.

Acragas (Agrigentum)

Acragas (in Roman times, Agrigentum) was the only Sicilian Greek city matching Syracuse in population and power and was often in conflict with it. Settlers from Gela and Rhodes (Gela's mother city) founded Acragas about 580. From about 570 to 554, the tyrant Phalaris ruled Acragas. He seized territory from the native inhabitants in the hinterland, as well as from Selinus to the west. The city grew rapidly because of its rich agricultural land and the extensive export of produce to Carthage and elsewhere. Like other Sicilian cities, Acragas was prone to political instability and frequently fell under tyrannical rule, which was sometimes benign and efficient but not always so. Tyrants of Acragas were lavish patrons of the arts and competed ostentatiously in the Olympic and other games. In ancient times its population, wealth, and luxury were spoken of in the highest terms. The city's wealth is, however, evident from the extent of the urban area (ca. 625 hectares) and the remains of the massive temples there. The city was situated on an elevated plateau about 4 kilometers from the sea, a naturally strong position further strengthened by good fortification.

From about 488 to 472 the tyrant, Theron ruled Acragas. His seizure of Himera in 483 provoked a Carthaginian attempt to control the whole of Sicily. Theron allied with Gelon, tyrant of Syracuse, who became his son-in-law. The victory they won over the Carthaginians at Himera in 480 was said (Herodotus 7.166) to have taken place on the same day as the battle of Salamis, and, in the eyes of western Greeks at least, matched that battle as a brilliant victory of Greeks over barbarians. Theron continued his close relationship with Syracuse under Gelon's successor Hieron.

Theron's son Thrasydaeus ruled for only a year (about 472), illustrating the common weakness of succession in a tyranny. His brutal regime ended

after a crushing defeat by Hieron in an attack on Syracuse. According to a problematic later tradition (Diogenes Laertius 8.63–68), the oligarchic regime of “The Thousand” then took power and was overthrown by a movement led by the famous philosopher from Acragas, Empedocles, who refused power and established a democracy.

Acragas and Syracuse together opposed Ducetius’ indigenous revolt, but the two cities fell out over the settlement of the war and Syracuse defeated Acragas in about 446 at the River Himeras (in southern Sicily, not to be confused with the city Himera). When Athens began to intervene in Sicily during the Second Peloponnesian War (431–404), Acragas made an alliance in 422 but remained unhelpfully neutral during the Athenian invasion of Sicily (415–413). The big Carthaginian invasion of Sicily beginning in 408 forced the previously hostile Greek states to combine. Greek resistance was concentrated at Acragas in 406 but poor coordination and dubious command decisions led to the allies abandoning the city during the siege. The Carthaginians entered and destroyed the city, massacring those left within it. Survivors and squatters apparently occupied the site afterward and for over 60 years Acragas had no recognized existence as a city.

After Timoleon’s victories over the Carthaginians, Acragas was formally resettled (ca. 340) and soon regained something of its former prosperity. In 314, it combined with Gela and Messana against the rising power of Agathocles, tyrant of Syracuse, but in the next year the imported Spartan leader Acrotatus failed and Acragas was forced to acknowledge Syracusan supremacy. In the confused state of Sicily after Agathocles’ death, Acragas was ruled by a tyrant Phintias (about 287–279). Phintias extended his power beyond the city’s territory and followed the practice of Hellenistic rulers in taking the title of king (*basileus*). In 278, Acragas under its next tyrant Sosistratus was besieging Syracuse when Pyrrhus of Epirus brought his army into Sicily from Italy. Sosistratus joined Pyrrhus’ war against the Carthaginians and was his most important Sicilian ally but when he withdrew Acragas’ forces from the prolonged siege of Lilybaeum, Pyrrhus had to abandon his Sicilian venture.

After the outbreak of the First Punic War between Rome and Carthage (264–241), the Carthaginian force sent to Sicily to oppose Rome’s support of the Mamertini occupied Acragas. In 262, the Romans captured Acragas after a siege of some six months. The city was sacked and the population enslaved. Later in the war, the Carthaginian general Carthalo seized the site

but set fire to what remained when he could not hold it (254).

In 215, during the Second Punic War (218–201) Acragas, which had revived to some degree, joined the anti-Roman movement. The city was a key position for the Carthaginian campaigns in Sicily and was garrisoned by them. In 210, Numidian mercenaries betrayed it to Rome. Again destroyed, the city revived later, as it had done before, and became the second city in the Roman province of Sicily. Its naturally strong position and its fertile territory ensured that the city could rise again after disaster.

Acrotatus I (Active 330s)

A Spartan of the Agiad dynasty, Acrotatus was the elder son of Cleomenes II; he predeceased his own father and so was never actually king. A harsh disciplinarian, Acrotatus opposed state forgiveness toward Spartiates accused of cowardice in the battle of Megalopolis (331). Extremely unpopular for this, he suffered plots against him, and even a beating. In addition, Sparta's low military profile in the age of Alexander and the *diadochoi* offered him very little chance to use his military training. Thus, he responded positively when, around 315, the Sicilian cities Acragas, Gela, and Messana asked Sparta for a commander of mercenaries to lead troops against the threat of Agathocles, tyrant of Syracuse. Acrotatus accepted the offer without the consent of the Spartan ephors. He settled an unrelated dispute in Apollonia in the Adriatic and then was voted 20 ships from

Sparta's old colony of Taras/Tarentum in Italy, and sailed to Acragas to assume the role of general of the anti-Agathocles forces. However, like Pausanias son of Cleombrotus at the end of the Persian Wars, and in keeping with his sternness after Megalopolis, Acrotatus began to act tyrannically. He executed a distinguished commander and mistreated people on his own side, enraging them until they attempted to stone him. He fled to Sparta (313?) but died soon afterward. His son Areus I became successor to Cleomenes II, Acrotatus' father.

Acrotatus II (d. 262)

Acrotatus II, son of Areus I, was a member of the Agiad royal family at Sparta who reigned from 265 to 262. His uncle Cleonymus, who believed he should have inherited the throne instead of Areus, was further alienated by the love affair between his young wife, Chilonis and Acrotatus. In 272, he called in Pyrrhus to support his claim and Acrotatus particularly distinguished himself in repelling the first attack. With only 300 men he routed a force of 2,000 Gauls and Chaeonians by a clever attack on their rear. The city was then saved by the arrival of reinforcements from Antigonus II Gonatas and the return of Areus I with 2,000 men.

Acrotatus succeeded his father in 265 but in 262 he was killed in battle at Megalopolis against its tyrant, Aristodemus the Good (Pausanias' account of the battle mistakenly calls Acrotatus the son of Cleomenes). His wife was pregnant at the time but the child, Areus, died as a boy and Acrotatus' cousin Leonidas (son of Cleonymus) became king.

Aegina, Aeginetans

An island in the Saronic Gulf approximately 29.6 kilometers from the Piraeus (the port of Athens); the name is also used for the island's main *polis*. Its position lent it considerable strategic importance as a naval base for conducting piracy or fleet-scale naval raids on mainland Greece, especially Attica. Much of its history is defined by conflict with its close neighbor, Athens, most likely beginning with Aeginetan piracy but escalating into an intermittent state of warfare that shaped Aeginetan policy through the fifth and fourth centuries.

The island of Aegina is 85.9 square kilometers, and at its height during the fifth century, it had a population probably in the 35,000–45,000 range. Of that number, probably 1,500–2,500 were male citizens of the hoplite class, and 7,000–10,000 were slaves or freedmen (Aegina had a reputation even in antiquity for a large slave population). Aegina's size and its location encouraged its elite to develop commercial interests: the island had two or three harbors and an *emporion* (trading-post), and Aeginetans practiced long-range, nonintermediated trade on the same model as the Ionian cities.

During the first half of the seventh century, Aegina operated under the hegemony of Argos, as expressed both through inclusion in the "lot of Temenos" (the portion of the Peloponnesus assigned to Temenos, the legendary Heraclid founder of Argos) and Aegina's membership in the cult league of Apollo Pythaeus. Around 700, Aegina was a charter member of the Calaurian Amphictyony, a sacred league of *poleis* centered on the island of Calauria. In the second half of the seventh century, Aegina was dominated by Epidaurus, until it gained its independence by force during the conflict between the tyrants Periander of Corinth and Procles of Epidaurus.

The earliest silver coinage was Aeginetan (ca. 560–540), the so-called turtles, which circulated unusually widely. Aegina's connections to Argos

and commerce are embodied in the anachronism that Pheidon, the tyrant of Argos, minted the first silver coins there (ca. 700–650). From 570–550, the Aeginetans had their own sanctuary at the Egyptian trading post of Naucratis (a privilege shared only by Miletus and Samos), indicating their commercial prominence. In 519, they expelled Samian exiles from Cydonia, a way station in western Crete for trade with Egypt, and recolonized the site.

In ca. 506, Aegina attacked Athens in support of a Theban and Chalcidian incursion, beginning the “Heraldless War.” Controversy surrounds Aeginetan membership in the Peloponnesian League, but the evidence stands against it. At the same time Athens founded a hero shrine of Aeacus, the founding hero of Aegina, for the purpose of claiming ownership of Aegina through appropriation of its founder. Amid intermittent combat, dramatic events occurred: Aegina submitted to Persia (491), only to be forced into a position of neutrality by Spartan king Cleomenes I’s exaction of hostages and their deposition at Athens; Aegina then abducted an Athenian sacred embassy; Athens supported (ca. 488) a dissident Aeginetan aristocrat, Nicodromus, whose attempt to overthrow the Aeginetan oligarchy was brutally suppressed, with survivors settled in Attica; and Aegina harbored ostracized Athenian politicians like Aristides (480s). The Themistoclean naval bill (483/2) used silver from the mines at Laurium to build many triremes against Aegina, ships deployed instead against Xerxes. Aegina and Athens were reconciled in 481 as Hellenic League members.

Despite its earlier Medism, Aegina was an important member of the Hellenic League, fighting at Artemisium, Plataea, and Salamis. Aegina seems to have avoided provoking Athens after 479. Some Aeginetan aristocrats began to make personal connections with the Athenian elite, detectable in the victory odes of Pindar. During the First Peloponnesian War, Pericles made Aegina a major target of Athenian aggression. In 457–456, Aegina was besieged, conquered, and reduced to tributary status within the Delian League; its fortifications and harbor facilities destroyed, and ships confiscated. After secret appeals from Aegina in 432–431, Sparta demanded Aeginetan autonomy as one of their final ultimatums preceding the Peloponnesian War. In retaliation Athens expelled the Aeginetans and resettled the island, perhaps partially with the families of earlier exiles, and later killed their Aeginetan prisoners. Many Aeginetan refugees settled in

the Thyreatis or at Cydonia, which Athens subsequently attacked.

Lysander restored the Aeginetans in 405, but numbers and prosperity never recovered. During the fourth century Aegina's policies were resolutely anti-Athenian: Aeginetans raided Athens regularly, first with Spartan and then with Macedonian collaboration. The Athenians made several unsuccessful attempts to reconquer Aegina during the first half of the fourth century. Hellenistic Aegina was aligned with (or dominated by) Cassander, the Antigonids, and the Aetolians, before joining the Achaean League in 229. This proved to be a mistake, as the Achaeans could provide no naval support and Aegina was conquered by the Romans in 210, the inhabitants possibly enslaved, and the island sold to Attalus I. Subsequently, Aegina was an Attalid naval station until its incorporation in the Roman Empire.

Aegospotami, Battle of (405)

A decisive Peloponnesian naval victory over Athens in the Hellespont (Dardanelles) during the Second Peloponnesian War (431–404), directly leading to Athens' loss of the war. The 180 Athenian triremes took station

off a beach at Aegospotami (“Goat’s Rivers”) on the European side of the Hellespont. On the Asian side, from Lampsacus—a better anchorage—Lysander was operating against the Black Sea grain route vital to Athens’ food supply. The Athenian anchorage was open and lacked nearby supplies of food—which the exiled Athenian general Alcibiades vainly pointed out.

The Athenians sailed out for four days in a row to tempt Lysander to fight. When he refused they returned, landed, and the ships’ crews went in search of food. In an excellent example of deception, throughout this Lysander kept his anchored ships fully crewed, but with the men concealed. When the Athenians left, fast ships shadowed them and Lysander kept his fleet manned until they reported. On the fifth day, when the scout ships signaled from mid-channel the Athenian crews were scattered looking for food, Lysander attacked. Only the state trireme, the *Paralus*, and eight ships under Conon escaped—the rest of the Athenian ships were captured, along with most of the sailors. In retaliation for recent atrocities, Lysander executed all the Athenians, except Adeimantus (who had argued against them), and apparently freed all non-Athenian captives. The loss of 171 triremes and skilled crew crippled Athens—Byzantium and Chalcedon deserted, Lysander closed the grain route to Athens and later blockaded the city, a major factor in its surrender (404).

Aelian (Aelianus Tacticus) (Active ca. 100 CE)

The late first/early second century CE author of a treatise on military tactics, *On the Military Arrangements of the Greeks*, which influenced warfare for 16 centuries. Aelian dedicated his work to Hadrian (117–138 CE), although he

confesses he began the work for the previous emperor, Trajan (98–117 CE). Some manuscripts indicate work actually began during Nerva's reign (96–98 CE). Aelian's contact with Frontinus, the author of a volume of military anecdotes (the *Strategemata*) inspired him to study tactical manuals and other military writings. The work has a comprehensive list of texts Aelian examined while researching (most do not survive). The result was a 53-book analysis of the tactical systems used by Alexander the Great and the Successors of half a millennium earlier. Aelian may have drawn heavily upon the earlier work of Asclepiodotus as the two have similarities. Arrian later drew on Aelian's work for the first 33 books of his own examination of tactics—the "Tactical Handbook." Aelian's work would also be copied or abridged in tactical manuals in the Byzantine Era, for Muslim armies of the Crusades, and Renaissance Italy. The pike and musket armies of sixteenth- and seventeenth-century Europe were heavily modeled on the Macedonian army outlined by Aelian, with English editions of his work first appearing in 1616 and 1631.

Aeneas Tacticus (Active ca. 350)

Aeneas was the author of the earliest extant Greek military treatise. The epithet *Tacticus*, "the tactician," was coined by seventeenth-century scholarship to distinguish him from other authors with the same name. He is commonly identified with Aeneas of Stymphalus, a contemporary

Arcadian general mentioned in Xenophon's *Hellenica*, though this cannot be demonstrated. Aeneas wrote several books on diverse topics, which apparently constituted a comprehensive manual of warfare. Only one book survives, conventionally entitled *Poliorketika* (*Siegecraft*), concerning defensive measures for safeguarding a *polis* against various forms of attack. The extant text refers to some of the lost books: *Paraskeuastike* (*Preparations*), which included fire-signaling, provisions, and procedures for putting a city and its territory into a state of defense; *Poristike* (*Procurement*), on military finances and logistics; and apparently a book about plots; while Aeneas signals his intention to write a further book entitled *Stratopedeutike* (*Encampments*). Some scholars have also seen a vague allusion to *akousmata*, "oral instructions," as indicating a separate book on military oratory, though others see it as an internal cross-reference. The text breaks off where a discussion of naval matters begins, so it is impossible to determine whether this was an independent treatise or short appendix. References to Aeneas in later military manuals suggest that he also wrote on tactics.

The *Poliorketika* is a unique technical source on Classical Greek siege warfare. Aeneas provides practical recommendations on averting external and internal threats and surviving a siege. These include the selection and stationing of troops; maintaining the population's morale, and preventing revolutions or betrayal; preempting and repelling surprise attacks; guarding the walls and gates, detection of smuggled arms, and methods of sending secret messages; and resisting assaults against the fortifications by enemy machines and engineering. Aeneas exhibits particular concern for factional strife and potential treachery within the city, and his work is an important witness to the socio-political dimensions of warfare. Aeneas appears to have combined firsthand experience of the realities of a city under siege with a broader knowledge of recent military developments. He illustrates his principles with historical examples, some derived from written sources, including Herodotus and Thucydides. Other examples relating to more recent events narrow the date of composition to the period of political instability in the 350s.

Aeneas' work was well regarded by Hellenistic military writers. Cineas of Thessaly, Pyrrhus' minister, prepared a summary, presumably for his king. Polybius cites Aeneas as an authority on fire-signals, and later recognized him as a pioneering figure in the genre. His *Poliorketika* (and

possibly lost books) was an important model for Philo of Byzantium, who became the main conduit for the reception of Aeneas' writings into Byzantine literature on siege warfare.

Aeschines (ca. 390–322)

Aeschines was an Athenian orator and statesman. He had a distinguished military record, serving at Mantinea (362) and Tamynae (348) and worked as an actor and minor public servant before becoming a politician. Aeschines' extant speeches (*Against Timarchus*, *On the Embassy*, and *Against Ctesiphon*), provide considerable evidence for the rise of Philip II of Macedon and internal Athenian political conflict.

In 347, while on a peace embassy to Philip, Aeschines was won over by him. His actions on another embassy (346) later caused Demosthenes to accuse him of treachery. Aeschines has suffered, probably unfairly, by comparison with Demosthenes, but his policy of friendship with Philip was arguably a viable alternative.

In 343, Demosthenes prosecuted Aeschines for treason. Both speeches (*False Embassy* and *On the Embassy*) survive. Aeschines was narrowly acquitted, but in 340 played a part in events leading to Philip's intervention and victory at Chaeronea (338). In 336, when Ctesiphon proposed awarding Demosthenes a gold crown, Aeschines took him to court. The real target was Demosthenes and his anti-Macedonian policy. The case, finally heard in 330,

was a vote on their respective policies. Aeschines was resoundingly defeated and went into voluntary exile, teaching rhetoric in Rhodes. A skilled orator, if not quite in the same league as Demosthenes, Aeschines' policies were realistic and arguably may have better preserved Athens' safety and prosperity than Demosthenes'.

Aeschylus (525–456)

One of the most famous Athenian tragedians, Aeschylus is a good example of the expectation that all able-bodied citizens who could afford the equipment would defend their *polis*. Tradition records he requested his tombstone state only that he had fought at Marathon (his brother was killed there). Aeschylus probably also fought at Salamis. The oldest of his seven surviving plays, *The Persians* (produced in 472), describes Xerxes' return to Susa after Salamis. It is the only extant Greek tragedy covering an historical event and, apart from its literary merit, provides useful evidence for Athenian attitudes to Persia, the war, and to the events of Salamis.

Aetolia, Aetolian League

Aetolia was the rugged, mountainous region in northwest Greece on the north coast of the Gulf of Corinth. It was bounded by Acarnania across the River Achelous to the west and the eastern (Ozolian) Locris to the east. Thucydides described the region as backward and uncivilized, retaining the practices of raiding neighbors and bearing arms in everyday life that had vanished elsewhere in Greece. Thucydides also emphasized, and may well have overestimated, the savagery of the inhabitants of the remote Aetolian hinterland. The Aetolians lived in scattered, unfortified villages and walled towns only developed toward the end of the fourth century. From earliest times the Aetolians had a sense of unity as an *ethnos* ("people" rather than "tribe"), with their cult-center and meeting place at Thermum. Communications between Aetolia and the outside world were difficult and the Aetolians played little part in Greek affairs until the time of Alexander the Great, and even after then were regarded as lagging behind the standards of Greek civilization.

By the time of the Second Peloponnesian War (431–404), Aetolia had gone beyond constantly raiding its neighbors to attempting to secure the cities along the northern fringe of the Corinthian Gulf, especially the port of Naupactus. A failed Athenian invasion of Aetolia under Demosthenes in 426 reveals the harshness of the terrain and the ability of the light-armed Aetolians to fight a devastatingly effective guerrilla-style war against a hoplite army. (A similar disaster befell the Spartans under King Areus in 280.) Some rudimentary form of Aetolia-wide organization is suggested in a 426 Aetolian embassy with a representative from each main Aetolian region requesting Spartan and Corinthian troops to attack Naupactus.

Early fourth century Aetolia developed into a more elaborate federal state with individual communities represented according to their population on a standing federal council. The supreme body was an assembly of all Aetolian citizens. This assembly, which elected the single federal general, met twice a year. Although opinion is divided, it seems that assembly decisions were made by a majority of votes of the individual citizens

attending, not by a majority of groups voting as separate communities.

An Athenian inscription of 367 (Harding 54) shows that by then the *koinon* (state or community) of Aetolia participated in the routine diplomatic courtesies of interstate festivals. In 338, Philip II of Macedon gave Naupactus to Aetolia, apparently to win its support for his settlement of Greece. Fearful that Alexander's "Exiles Decree" would force them to give up recent gains in Acarnania, the Aetolians joined in the failed revolt against Macedon (the Lamian War, 323–322). Aetolia was fortunate that Antipater and Craterus had too many other pressing concerns and granted Aetolia a separate peace. From now on, Aetolia was drawn into Greek affairs, first siding with Antigonus I Monophthalmus against Cassander and Polyperchon, and later usually an enemy of Macedon. The confusion caused by the ongoing power struggles of the Successors and their heirs created opportunities for expansion.

During the Gallic invasion of Greece in 279, Aetolia did much of the fighting and achieved a spectacular, but perhaps overrated, success in defending Delphi against the invaders. As a result, Aetolia expanded its territory, taking over eastern Locris, pushing further into Acarnania and western Phocis, as well as controlling the important and prestigious panhellenic shrine at Delphi. Aetolia went on to dispute possession of Thessaly and its neighboring territories with Macedonia. Aetolia's acquisition of Pagasae on the Saronic Gulf by about 225 opened a way into the Aegean. Aetolia also made alliances in the Peloponnese, with Elis, Messenia, and some Arcadian cities, giving it an important role in this key area, and bringing it into conflict with the Achaean League.

From the outset of this expansion, contrary to general Greek practice, Aetolia included newly acquired cities into its own federal structure. The people of such cities that bordered on or were close enough to Aetolia became full Aetolian citizens while retaining their original citizenship (*sympoliteia*). In the case of more distant cities, citizens of newly acquired cities could obtain full Aetolian citizenship if they moved to Aetolia (*isopoliteia*).

The Aetolian League eventually included peoples and cities from the Adriatic to Lysimacheia on the Hellespont and Chalcedon on the Bosphorus, a number of island states in the Aegean Sea (e.g., Chios) and even some cities in Crete. This widespread expansion was largely due to membership of the Aetolian League being seen as the best protection against Aetolian raids

by land and sea. Individual Aetolians had never given up the old practices of brigandage and piracy against other peoples. Also when Aetolians had a grievance against a citizen of any other state, they could resort to the practice of indiscriminate reprisals against any citizen from that state by way of compensation. The Aetolian state saw no reason to restrain such activities, in which leading Aetolians naturally took part. The Aetolians had also developed the custom of "Plundering the Plunder." This was the practice, peculiar to Aetolia, of raids and piracy by individual Aetolians against any states fighting wars in which the Aetolian state was not itself involved. In wars waged by the Aetolian state, its forces commonly lived up to their reputation for brutality and rapacity. Plundering and war, whether by individuals or the state, seem to have been for Aetolia as much a source of income as the mercenary service popular there and in other poor regions in Greece.

In 272, Antigonus II Gonatas astutely ended hostility between Macedon and Aetolia with a peace treaty leaving Aetolia in control of Delphi. Later, in 241, Gonatas made an alliance with Aetolia against the Achaean League. This policy of cooperation between the two strongest military powers in Greece ended after Gonatas' death. In 239, an Aetolian move to gain control of northern Acarnania led to a prolonged war between the two, the "War of Demetrius" (238–229).

In the Social War (220–217), Philip V of Macedon attempted to curb the traditional Aetolian activities in his sphere and forced a peace on Aetolia in 217. When Philip's alliance with Hannibal (215) provoked Roman intervention in Greece (Rome's First Macedonian War, 215–205), Aetolia was ready to take the Roman side. An alliance with Rome in 212 promised Aetolia any territory it won in the war, while Rome was to take the moveable booty. In the event Aetolia lost Thessaly, Phocis, and other territories to Philip and was left disappointed and empty-handed when Philip made peace, first with his Greek enemies (206), and then with Rome (205).

In the Second Macedonian War (200–196), Aetolia was an unhelpful Roman ally and was further alienated by Flamininus' refusal to hand over to all the territories it had lost to Philip and his rejection of their demand that Philip be deposed. In spring 192, Aetolia sent an invitation to the Seleucid king, Antiochus III, to carry out "the liberation of Greece." The expectation that Roman influence in Greece would inhibit the Aetolians' old

ways of plundering may also have played a part. Aetolia's contribution to Antiochus' war in Greece was limited to a diversionary expedition to Sparta in 192, where their forces murdered their ally Nabis and pillaged the town, and to the ineffective holding of the mountain route that allowed Roman forces to turn the Pass of Thermopylae in 191.

Left stranded after Antiochus' rapid retreat from Greece, Aetolia was able to defy Rome for two years in the fastness of its mountainous territory, while Roman forces were needed elsewhere. Rome's first demand for complete surrender was followed in 189 by more moderate terms, under which Aetolia became a subject-ally of Rome and lost the right to make war at its choosing. It also had to pay an indemnity, heavy for such a state, of 200 talents, and give up Delphi. Under Roman dominance of Greece, Aetolian raiding and piracy also now became a thing of the past. As a result, there was bitter and murderous conflict in Aetolia between impoverished debtors and the wealthy, unsolved by an appeal to Rome in 174. Suspicious of King Perseus' popularity among the poor, Rome garrisoned Aetolia during the Third Macedonian War (171–168). After Perseus' defeat Rome did not object to the massacre by the pro-Roman faction of 550 opponents and the expulsion of more. Aetolia did not take part in the Achaean Revolt (146).

Aetolia's history is largely filtered through the views of the historian, and Achaean League politician, Polybius. However much his bias against Aetolia may be compensated for, Aetolia remains an odd combination of primitive methods of warfare with advanced political institutions.

Agathocles (ca. 361–289)

Agathocles was born in Thermae Himeraeae, on the north coast of Sicily, ca. 361. His father was a potter from Rhegium, who settled in Syracuse when Agathocles was a child. Agathocles served with the Syracusan military under Timoleon, and later fought with some distinction against the Brutii in southern Italy.

Agathocles was exiled from Syracuse twice following failed coups, but in 317 seized power as *strategos autokrator* (general with autocratic power). In reality, he ruled as a tyrant until eventually declaring himself king. Agathocles' successful coup was due to a combination of the military support of his army of mercenary soldiers and his denouncement of the city's oligarchic faction: this won the support of the Syracusan masses. On seizing power, Agathocles is alleged to have banished or murdered some 10,000 of his opponents. Agathocles then embarked on military campaigns to subjugate the Greek cities of Sicily (316–313). The expansion of his power westward provoked war with Carthage which, fearful for its own possessions on the island, sent a large army to Sicily.

In 311, Agathocles' army held the stronghold at Phalarium while the Carthaginians occupied the stronghold of Ecnomius on the other side of the River Himeras. When the armies met in battle, Agathocles was defeated and soon Syracuse itself was under siege. The following year Agathocles landed an army in Libya to threaten Carthage and relieve the pressure on Syracuse, the bold move catching the Carthaginians by surprise. Agathocles defeated a Carthaginian army at Tunis. A second battle at Tunis in 309 resulted in another Greek victory, but Agathocles' cause in Sicily was going badly and he returned to Syracuse in 308 to take charge of affairs there, leaving his son Archagathus in command in Libya.

Managing to slip through the Carthaginian blockade unnoticed, he took charge of 17 warships and with the aid of a naval contingent of another 18 ships from his Etruscan allies defeated the Carthaginian naval blockading force, ending the siege of Syracuse. He returned to Libya but was forced to abandon both his army and his two sons. He concluded a peace treaty with Carthage in 306 giving him control of all Greek Sicily (Carthaginian possessions were bounded by the River Halycus).

In 304, emulating the behavior of the *diadochoi*, Agathocles took the title of king. He extended his territorial possessions by his military control

over southern Italy and also conquered Corcyra. He died in 289, allegedly poisoned, declaring Syracuse a democracy before he died.

Our main primary source for the life and career of Agathocles is the later writer Diodorus. His main source for Agathocles was Timaeus of Tauromenium, a contemporary opponent of Agathocles.

Agesilaus II (Reigned ca. 401–ca. 360)

Agesilaus II, a Spartan king of the Eurypontid dynasty from about 401 until his death ca. 360, reigned through extreme turnabouts in Spartan history. Probably born around 445/4, Agesilaus seemed not destined for the Spartan throne: his brother King Agis II had a son, whereas Agesilaus had a limp, and a prophecy had warned that a limping Spartan king would bring disaster to the Spartan state. However, the Spartan admiral Lysander (Agesilaus' *erastes* or older lover) accused Agis' son of being Alcibiades' bastard. Thus Agesilaus ascended to the Spartan throne. Perhaps a year after he became king, the conspiracy of Cinadon occurred, uniting Helots, *Perioikoi*, and members of several marginal groups in Sparta against the Spartiates. The Spartan authorities successfully quelled this danger.

Agesilaus and Lysander next embarked upon a panhellenic invasion of the Persian Empire, which was demanding tribute from the Greek cities of Asia Minor. Before setting off, Agesilaus attempted to sacrifice at Aulis in the style of Agamemnon, but was stopped by a group of Thebans. He took his army to Asia, reaching Ephesus in 396, and announced to Tissaphernes that he had come to make the Greek cities of Asia autonomous. Agesilaus'

plan involved breaking off portions of the Empire rather than taking it over as a whole, urging Pharnabazus to revolt, and entertaining embassies from many nations in the Persian Empire desirous of secession. He raided Phrygia and Lydia (396/5), seized spoils at Sardis, and may have intended to attack the Persian king himself.

However, Agesilaus was recalled by the administration at Sparta when Persia bribed men in Corinth, Athens, Argos, and Thebes to attack Spartan holdings, beginning the Corinthian War. He fought at Coronea in Boeotia in 394, sustaining an injury requiring his withdrawal, and could only helplessly stand by while Conon's Persian-financed fleet defeated the Spartan navy at Cnidus (394), expelled Spartan harmosts and garrisons in many Greek cities, raided Laconia's coast, and occupied Cythera, destroying Sparta's Aegean empire.

Soon Agesilaus recovered sufficiently to raid the Argolid, Lechaenum, and the Piraeus in Attica (393–392), returning to Sparta only after Iphicrates destroyed a division of the Lacedaemonian army at Lechaenum (390). Agesilaus fought in Acarnania in 389 and tolerated, but took no part in, the invasion and dissolution of Mantinea, shortly after which the King's Peace occurred. Agesilaus also refrained from taking part in Sparta's invasion of Olynthus and its side-effect, Sparta's invasion of Thebes, although he justified that invasion in speeches (382). He besieged Phlius for over a year to punish its recalcitrance in supporting the invasion of Olynthus. Upon its surrender in 379 his reprisals included establishing a Lacedaemonian garrison and new law code, and executing certain individuals.

This was a high point in the might of the Spartan state during Agesilaus' reign. However, the 379 coup in Thebes led to the expulsion of its Spartan garrison. King Cleombrotus of the Agiad house of Sparta invaded Boeotia in response; Athens' assistance to Thebes caused the Spartiate Sphodrias to raid part of Attica as a punishment, at which point the Second Athenian Confederacy was created. Agesilaus raided Thebes over the following two years, but was injured again and was out of commission while Pelopidas' reorganized Thebans beat the Spartan army, the Athenian navy defeated a Spartan fleet at Alyzia, Jason of Pherae began strengthening himself, and the Thebans attacked Phocis. A renewal of the King's Peace in 375/4 failed to prevent war between Athens and Sparta at Zacynthus and Corcyra.

Negotiations for another renewal in 371 provoked Agesilaus to deny Thebes' claim to represent all Boeotia, causing King Cleombrotus then to

attack Boeotia: the Spartan defeat at Leuctra constituted a terrible, permanent setback to Spartan power and reputation. Neither Agesilaus nor Sparta could hinder Mantinea's reunification in 370, nor could Agesilaus halt the creation of an aggressive Arcadian federalism. Agesilaus may have been instrumental in preventing the Theban army from invading Spartatown itself during the subsequent Theban invasions of Laconia in 370 and 369. However, when the Theban army detached Messenia, freed the Messenian Helots, and fortified the city of Messene as a new capital at Mount Ithôme, Agesilaus was blamed for Sparta being deprived of half its economic base. The foundation of Arcadian Megalopolis shortly afterward, which included former possessions of Sparta, sapped Spartan regional power further. All of this provoked the aged Agesilaus to perform mercenary work to regain funds for the Spartan state. He died in around 360 while serving Egypt, which was attempting to rebel from the Persian Empire. His body was encased in wax and sent back to Sparta.

Agesipolis I (d. 381)

Agesipolis I, of Sparta's Agiad dynasty in the early fourth century, was the son of Pausanias, and reigned alongside Agesilaus II. Agesipolis' kingship began during the Corinthian War (395–387/6). In 388, after oracular consultations, young Agesipolis led a successful campaign against Argive territory, undaunted by an earthquake and desirous of surpassing Agesilaus' destructions three years earlier.

He campaigned next in 385 to force Mantinea to destroy its walls, punishment for its disloyalty toward Sparta during the Corinthian War. He besieged Mantinea and dammed and rerouted its river to damage the city's

infrastructure. The Mantineans agreed at this point to tear down their walls, but the Spartans further demanded that Mantinea be divided into its five constituent villages in keeping with the autonomy principles of the King's Peace.

Agisipolis also took part in Sparta's campaign against Olynthus and the Chalcidian League. In 381, he took over the campaign. The Spartiate population crisis meant that his army consisted of only 30 Spartiates but many *Perioikoi*, *nothoi* or illegitimate sons of Spartiates, and foreigners raised along with the Spartiates. He fell sick after seizing Torone and died at the Temple of Dionysus at Aphytis. His corpse was sent back to Sparta for a royal funeral. Agesilaus mourned, having come to appreciate his younger colleague greatly. His death, mercifully for him, occurred a decade before Sparta's terrible defeat at Leuctra.

Agis II (ca. 460–ca. 399)

Agis was from the Eurypontid house and succeeded his father Archidamus II as king of Sparta in winter 427/6. In the following two years, he commanded the annual Peloponnesian invasion of Attica that was Sparta's routine strategy in the first phase of the Second Peloponnesian War. In 419 and 418, he held commands in the Peloponnese against Argos and the states allied with it. His conduct in these campaigns drew some severe criticism at Sparta but in the late summer of 418 he was given a further chance, assisted by 10 advisors (a first for a Spartan king). More by good luck than good management, he inflicted a severe defeat on the forces of Mantinea, Argos, and Athens at the battle of Mantinea.

In the spring of 413, when Sparta resumed hostilities against Athens, Agis commanded the forces sent to Decelea in Attica to establish a permanent post (the Greek term is *epiteichismos*) to inflict systematic damage on enemy territory. This strategy had been discussed at Sparta

before the outbreak of the Peloponnesian War in 431 but was only now put into action, not through Agis but largely because of the urging of the Athenian Alcibiades, then a renegade. Agis commanded at Decelea until the end of the war in 404 and, while the raiding from Decelea did considerable damage to the Athenian economic resources, it was never enough to bring about an end to the war. Agis' two attempts to move against the city of Athens from Decelea achieved nothing. Agis himself recognized that the war could only be won by challenging Athens at sea but he himself played no direct part in these operations in the Aegean. His dispatch of a force under Clearchus (later the commander of Cyrus' "Ten Thousand" Greek mercenaries) to occupy the key city of Byzantium was the right strategy but unfortunately miscarried.

Agis, along with his fellow king Pausanias, commanded forces in the final siege of Athens in the winter of 405/4 but played only a minor part in the negotiations leading to the Athenian surrender and he played no part in the conflicts in Athens in 403–402, in which Lysander and King Pausanias were in turn heavily involved. In about 400, he carried out an extensive raiding campaign in Sparta's war against Elis and brought this war to an end by establishing a permanent raiding post. He died ca. 399 on his way back to Sparta from making victory offerings at Delphi. In an unexpected turn of events, his son Leotychidas was judged to be illegitimate and Agis' bother Agesilaus came to the throne.

As a commander Agis showed on some but not all occasions a routine competence. However, not even his victory at Mantinea in one of the few big set-piece hoplite battles of the Peloponnesian War induced Sparta to entrust him with any other decisively important role calling for a commander of genius.

Agis III (d. 331)

Agis III, son of Archidamus and grandson of Agesilaus II, was a king of Sparta's Eurypontid dynasty. From 338 to 331, he ruled a Sparta radically reduced in territorial size by the Theban liberation of Messenia in 370/69 and by Philip II's seizure of Spartan borderlands.

Opposition to Macedon defined Agis' career. Around 333, Agis requested and received sufficient assistance from Darius III to capture many Cretan cities. He hired mercenaries who had backed Persia against Alexander at Issus and many mercenaries from Crete.

In 331, when Thrace rebelled against Macedon, Agis attempted a general Greek revolt. Arcadia, Elis, the Achaean League, and some northern Greeks joined without Athens, whose contributions (including 392 triremes) might have been decisive. Nonetheless, Agis led an army of 20,000 infantry plus some 10,000 mercenaries. Antipater left Thrace and moved south to the Peloponnese leading 40,000 men including mercenaries paid by a 3,000 talent fund sent by Alexander. The two armies clashed near Megalopolis in Arcadia, which had remained loyal to Alexander. Agis and his coalition reportedly fought bravely, but lost. Some 5,300 in the Spartan-led coalition died, and 3,500 of the Macedonian alliance.

Agis was mortally wounded. After his death, Sparta could only beg forgiveness from Macedon and give elite hostages to Antipater.

Agis III, Revolt against Macedon (331)

Agis III, king of Sparta, sought in the mid-330s a way to counter Macedonian domination of Greece, especially in the Peloponnese. Our sources for his revolt are limited and confusing. Curtius' narrative at the end of Book 5 is missing and Arrian gives it only a brief mention. Diodorus provides some useful details, but confuses the chronology. As a result, debate over the dating remains unresolved.

Agis conceived a plan to invade Greece from Crete using Persian wealth to raise an army. In 333 Autophradates, a Persian officer at Halicarnassus, provided ships and cash, which Agis used to hire mercenaries who were available following the battle of Issus. His insurgency began in the same year on Crete where he successfully took control of the island for Persia and continued recruiting. He seems to have bided his time building his army in Crete.

Two years later, Agis, working with anti-Macedonian groups on the mainland, took advantage of Macedonian difficulties in the north (a revolt in Thrace) to move into the Peloponnese with his army, reportedly more than 20,000 strong, and initiate the military revolt. There he defeated the local Macedonian commander, Corrhagus. Agis gained allies including the Arcadians (except Megalopolis), Elis, Tegea, and the Achaeans (except Pellene). They seem to have had support from some other Greek *poleis*, but Athens declined to support the revolt. That Alexander still held numerous Athenian hostages no doubt contributed to their decision. Several other important members of the Corinthian League also did not support the revolt. The insurgents then laid siege to Megalopolis.

Antipater first made a deal to end the revolt in Thrace, then started to raise a larger army. At about the same time, Alexander dispatched his admiral Amphoterus against Crete, where he was successful, with orders to follow-up against the rebellion in the Peloponnese. When Alexander learned after departing Babylon that Agis' revolt continued, he dispatched Menes with 3,000 talents of silver to Antipater to pay for the war efforts.

Regardless of the funds, which may have been too late anyway, Antipater's army reportedly grew to 40,000 men, including troops from various Corinthian League cities including Athens, Corinth, Argos, and Messene. He moved against the insurgents, who continued the siege. In the ensuing battle of Megalopolis, Agis III died and the revolt dissipated.

(probably in late 331). Antipater put the punishment before the League of Corinth assembly, which imposed a fine on Elis and the Achaeans and banished the Tegeans, but left the punishment of Sparta to Alexander. The revolt was defeated, but some of the same forces came together nine years later in the Lamian War.

Agis IV (ca. 265–241)

Agis was from the Eurypontid house at Sparta and became king ca. 243. He was a young idealist and aimed to restore Sparta’s military power. At that time Sparta was barely able to withstand Macedonian intervention or contend with enemies in the Peloponnese. An extreme concentration of wealth among a small number of Spartiates (and in particular among Spartiate women) had intensified Sparta’s weakness by severely reducing the number of citizen landowners qualified for hoplite service. Impoverishment was accompanied by widespread indebtedness, and the old Spartiate way of life had crumbled.

Once king, Agis proposed revolutionary reform. The Spartiate way of life would be revived by a cancellation of all debts and a redistribution of all land among the citizen body and a larger number of persons to be recruited from among the *Perioikoi* and suitable foreigners. This program was justified as the only way to restore the traditional austerity that had been the basis of Sparta’s military power.

Such radical policies provoked bitter opposition and Agis and his

supporters had to resort to threats of violence, violations of Spartan constitutional practice and expulsion of opponents, including his fellow-king Leonidas. The debt cancellation was carried out but the land distribution stalled.

Agis then led a Spartan force to Corinth, to assist the Achaean League against the Aetolians. In his absence, with the return of Leonidas, opposition to his policies had intensified. There was growing alarm at the upheaval to date, as well as resentment over the non-implementation of the land redistribution. Some of his former supporters were unwilling to go beyond the debt cancellation, from which they had benefited greatly, to a land redistribution, from which they would lose heavily.

After a violent clash on his return, Agis was driven to seek sanctuary in a temple but was trapped while outside it and, after a show trial, was executed, along with his mother and grandmother. His proposed land redistribution lapsed, to be taken up some 15 years later by King Cleomenes III.

Agoge

The Greek term *agoge* may describe various forms of education or “upbringing,” but most commonly refers to the system of communal upbringing practiced in Sparta. This was perceived as a defining aspect of Spartan culture, and involved a degree of state involvement that was exceptional among contemporary Greek societies.

A Spartan boy’s formal education began around age seven, as in other Greek states. However, rather than being instructed by a private tutor, he

was assigned to a troop of boys his age, under the command of an older boy, and under the ultimate authority of a state-appointed official, the *paidonomos*.

The boys underwent a harsh regimen. They were expected to behave modestly and obediently, walk barefoot, wear a single type of clothing for all seasons, and subsist upon limited rations. At the same time, they were tacitly encouraged to steal food. Xenophon (*Constitution of Lacedaemonians* 2.8) comments that those who were discovered were punished not for stealing, but for being caught. They also took part in a range of athletic activities, including the ritualized theft of cheeses from the altar of Artemis Orthia. At least some boys participated in the enigmatic *crypteia*.

Traditionally, we have combined all of our evidence for the *agoge* to provide the fullest possible picture. However, much of that evidence comes from late sources, such as Plutarch, who was writing in the Roman period, some 400 years after Sparta's heyday. Some scholars (notably Kennell) have argued that the *agoge* underwent numerous changes during its long history, and so we cannot take later testimony as evidence for the *agoge* of the Classical Period; for that, we should rely upon contemporary authors, such as Xenophon.

In another debate, it has commonly been assumed that the *agoge* provided a comprehensive education, but scholars now suggest that it may have represented only one aspect of a youth's education, with more academic learning remaining within the private sphere. There is similar debate regarding the private or public nature of the education of Spartan women, which, although limited in comparison to that of boys, was also notable among contemporary Greek societies.

The activities of the *agoge* have often been connected, more or less explicitly, to the reputed militarism of Spartan society. Yet activities such as stealing and the *crypteia* emphasize self-reliance and cunning, rather than the disciplined mass-phalanx for which the Spartans were famous. However, whether or not the *agoge* contributed directly to the Spartans' battlefield performance, it was certainly a major formative experience for any Spartan boy. Completion of the *agoge* was a prerequisite of citizenship. Furthermore, at around age 12, when a boy customarily entered into a pederastic relationship with a young man already in military service, and from the age of 20, when he was eligible for election to the elite *hippeis*, his performance in the *agoge* was undoubtedly a major factor in determining his success or

failure.

Ai Khanoum

Ai Khanoum was an impressive Hellenistic city in northern Afghanistan, on the border with Tajikistan. It is important as the only significant Hellenistic Greek site in the region that has been excavated (albeit partially because of ongoing local conflicts).

Its location at the junction of the Rivers Kokcha and Amu Darya (Oxus) has prompted its identification as Alexandria on the Oxus, one of the cities founded by Alexander to help pacify the region during his Bactrian campaign (330–328/7).

However, there is no firm evidence to link the site with Alexandria on the Oxus, and several things militate against it. First, it was not a grid-style city of the sort expected from a new foundation. It grew irregularly, probably on top of an Achaemenid Persian site. Second, although the earliest phase of Greek settlement appears to be late fourth century, a third-century inscription mentions a “*temenos* (shrine) of Cineas.” This appears to have been set up during renovation of the shrine to the city’s founder—Cineas, not Alexander or one of his well-known generals.

On balance then, the city is very probably not Alexandria on the Oxus, but it is an important site built on an agricultural plain at a strategic location—both military and commercial (it was astride the main trade route for lapis lazuli). Around 170, it may have been the capital of Eucratides the Great, although again there is little direct evidence. From the numismatic evidence it may already have been in decline when destroyed by invading

nomads ca. 145.

Alalia, Battle of (ca. 540)

Alalia (modern Aleria) was a colony in Corsica established by settlers from Phocaea in Ionia ca. 566. The Phocaeans abandoned their city when it was besieged by the Persians (ca. 546). Fewer than half of them carried through with the project of settling in their colony in Corsica. For five years the new and old settlers carried on raids against Etruscan and Carthaginian shipping and ports. These retaliated by each contributing 60 warships to a fleet sent against Alalia.

The Phocaeans of Alalia engaged this fleet in the open sea and won what Greeks called a “Cadmean victory” (later a “Pyrrhic victory”): technically the victors, they lost 40 of their warships and the other 20 were disabled. The Phocaeans then abandoned the colony at Alalia and moved to Rhegium in southern Italy.

The Phocaeans, among the first to use penteconters (50-oared warships), excelled at this time in long-distant trading voyages and in piracy. Their settlement at Alalia is a rare instance of a Greek colony failing because of opposition from civilized states.

Alcaeus (b. ca. 620)

Alcaeus was an aristocrat and noted lyric poet from Mytilene on Lesbos. His poetry, surviving only in fragments, includes hymns, drinking songs, love poetry, and political polemic. Perhaps his most famous poem is Fragment 6, the first known example of the “ship of state” metaphor.

Alcaeus played an active part in early sixth century Mytilenean politics and warfare, although probably too young (ca. 612–609) to help his older brothers kill the tyrant Melanchrus. However, around the turn of the century he fought against Athens in the war over Sigeum, apparently discarding his shield in one action. Like Archilochus, he wrote a poem about it.

With his brothers and Pittacus, Alcaeus plotted to overthrow Melanchrus’ successor, Myrsilus. Although the details are obscure, Pittacus may have betrayed the plot—at any rate Alcaeus and his brothers went into exile. During his exile, Alcaeus may well have traveled to Egypt and perhaps Thrace and Boeotia. He may also have served as a mercenary (in Lydia?), like his brother Antimenidas, whose exploits under Nebuchadnezzar Alcaeus records (fr. 350). Alcaeus wrote a poem celebrating Myrsilus’ death, but he and his faction may have been prevented from returning because Pittacus was elected as *aisymnetes* (supreme ruler) “against the exiles.” According to tradition, Pittacus, who ruled ca. 590–580, eventually allowed Alcaeus to return.

Alcetas (ca. 420–ca. 360)

Alcetas was king of Molossia, the northern region of Epirus. By 384, he was living in exile in Syracuse and was brought back by a force of Illyrians organized, and in part equipped with Greek hoplite weapons, by the tyrant Dionysius I of Syracuse. The invaders defeated the Molossians in a battle in which 15,000 Molossians were reportedly killed. Sparta then intervened to drive out the Illyrians but Alcetas apparently regained his throne. In about 375, he and his son Neoptolemus (who later succeeded him) joined the Second Athenian Confederacy. By 374, he was also in alliance with, and perhaps subject to, Jason, the tyrant of Pherae. In 373, Alcetas assisted in bringing peltasts by land across his kingdom for the Athenian campaign to raise the Spartan siege of Corcyra.

Alcetas was the first ruler to create a state of some consequence in what was a backward region until this time. The kingdom was later linked closely with Macedonia. Alcetas was the grandfather of Olympias, mother of Alexander the Great.

Alcibiades (ca. 450–404)

Alcibiades, son of Cleinias, was a wealthy Athenian political and military leader in the Second Peloponnesian War (431–404). Charismatic and controversial, Alcibiades illustrates the lack of delineation between the civil and military spheres in ancient Greece and how political conflict could affect military operations.

Alcibiades moved in the highest social and intellectual circles; Pericles was his guardian and he knew Socrates. In 416, he entered an unprecedented seven chariot teams in the Olympic games. This lavish lifestyle, along with dubious personal conduct made him unpopular with

many in democratic Athens and provided excellent ammunition for his political opponents.

Alcibiades served at Potidaea in 432 and in the cavalry at Delium in 424, but first appears in Thucydides—our major source for him—after the Peace of Nicias (421). Alcibiades persuaded the Athenians to join Argos' anti-Spartan alliance—a risky undertaking, but offering the potential to neutralize Sparta. Although Alcibiades later claimed he had made the Spartans stake everything on one battle, allied defeat at Mantinea (418) ended the venture. The only result was increased Spartan hatred and distrust, helping lead to renewed war in 413 after the destruction of Athens' Sicilian expedition—in which Alcibiades also played an instrumental role.

In 415, Alcibiades urged an expedition against Sicily. Thucydides' account of the debate between Nicias and Alcibiades suggests Alcibiades was influential in the Athenian decision to do so. Unfortunately for Alcibiades (and ultimately Athens) just before sailing, he was accused of involvement in the mutilation of the Hermae (sacred statues located all over Athens) and also of sacrilegious parodies of the cult of Demeter at Eleusis. Despite requesting resolution before he left, the expedition was dispatched anyway and Alcibiades' political enemies kept the issue inflamed while he was away.

The Sicilian campaign began reasonably well but Alcibiades was recalled to stand trial before momentum was achieved. This left a major gap in the command of the expedition, exposing Athens to considerable risk. Worried his enemies had made it impossible for him to successfully defend himself (or perhaps because he was guilty), Alcibiades fled to Sparta. Alcibiades had family links with Sparta, was adept at fitting into new environments, and soon influenced Sparta's policies. He successfully recommended that Sparta send out a general to Sicily to stiffen local resistance, renew the Peloponnesian War, and occupy Decelea in Attica. Although all this was successful, Alcibiades soon fell under suspicion in Sparta (including of having affair with the wife of Archidamus II, one of the Spartan Kings). In 412, during a trip to Ionia that caused several Athenian allies to change sides, he defected again, this time to Persia.

Working at the court of the satrap Tissaphernes, Alcibiades recommended a policy of keeping both Athens and Sparta weak. To regain influence at Athens, Alcibiades then advocated a pro-Athenian policy. Although his maneuverings undermined his position with Tissaphernes and

led to an oligarchic coup at Athens, it eventually ended his exile. When the democracy was overthrown in Athens (411), the Athenian force at Samos refused to participate and elected Alcibiades *strategos* (general), hoping this would secure Persian financial support. Alcibiades' major service to Athens at this point was to prevent the fleet at Samos sailing against Athens. This would certainly have led to the loss of the Athenian hold in Ionia and the Hellespont and probably also to a general Athenian collapse. For the next three years, Alcibiades was active in the war in Ionia and the Hellespont. He never delivered on his promises of Persian support and in 410 was arrested by Tissaphernes, but escaped. Later that year he won a decisive naval victory off Cyzicus. On the restoration of democracy at Athens (also 410), Alcibiades was elected general *in absentia* to conduct the war in the northeast. In 407, he triumphantly returned to Athens and was reelected *strategos* in person. However, suspicion and political enmity continued to dog him. In a lapse of judgment in 406, Alcibiades left his steersman, Antiochus, in charge of the fleet. Despite strict instructions, Antiochus precipitated a naval battle at Notium, and was soundly defeated. Alcibiades' enemies pounced and he was exiled again, moving to the Hellespont. The Athenian generals at Aegospotami ignored his good advice and in 404 Alcibiades was murdered in Phrygia. Alcibiades was a brilliant but flawed character whose undoubted political and military talents consistently failed to deliver for Athens because of hostility from his political enemies and suspicions about his extravagant lifestyle and personal conduct.

Alcidas (Active ca. 428/7)

Alcidas was Spartan navarch for 428/7. Commanding the Spartan fleet sent in spring 427 to relieve the Athenian siege of Mytilene, he had only reached Delos when informed of Mytilene's surrender. Alcidas then went to the coast of Asia Minor but anxiously avoiding any encounter with Athenian warships returned home as soon as possible. The revolt of Mytilene was the first big challenge to Athenian imperial control of the Aegean but Alcidas was not the man to exploit this opportunity. Even after the collapse of Mytilene, he rejected pleas from Spartan sympathizers to attempt to raise further revolts in the eastern Aegean. He did, though, capture neutral shipping and execute the crews, for no good reason.

The same timidity and incompetence were apparent later in 427 when Alcidas ineffectually commanded a Spartan squadron sent to intervene in Corcyra, then in turmoil through internal conflict. Despite this worse-than-mediocre record, Alcidas was one of the commissioners sent out by Sparta in 426 to establish the Spartan colony of Heraclea in Trachiniae.

Alcmaeonidae

The Alcmaeonidae were a wealthy and unconventional aristocratic family

in Athens. They were at the height of their influence in the sixth century, but important Athenians of the fifth century, Pericles and Alcibiades, had Alcmaeonid ancestry on their mothers' side.

The first known member of the family is Megacles, who was archon (the chief magistrate in Athens in this period) in around 632. He was connected with a very shadowy event, the killing of the supporters of a would-be tyrant, Cylon, on the Acropolis. Sometime after the event the family's opponents, who were in control of major religious cults, succeeded in having the Alcmaeonidae exiled for sacrilege on the grounds that they had killed Cylon's supporters while they were in religious sanctuary.

Plutarch claims that he saw Delphic records naming Megacles' son, Alcmaeon, as Athenian commander during the First Sacred War at Delphi. The records, like the war, were probably spurious. More plausible is the story that Alcmaeon acquired wealth through connections with Lydia, though Herodotus' story involving Croesus has chronological problems. Alcmaeon's son, another Megacles, married Agariste, daughter of Cleisthenes of Sicyon. Megacles was, according to Herodotus, one of the three major political leaders in Athens, leading a group of families associated with the "coast," probably the southern part of the agricultural plain around Athens. Megacles at various times supported and opposed the rise of the tyrant Peisistratus. For at least part of the Peisistratid tyranny, the family was in exile.

Megacles' son Cleisthenes acquired influence at Delphi, helping rebuild the temple of Apollo in the late sixth century, and apparently used his influence to get the Delphic oracle to urge the Spartans to overthrow the Peisistratid tyranny. Returning to Athens, and fending off various challenges, in about 508/7 Cleisthenes introduced reforms that set the basis for the Athenian democratic system over the next two centuries. After Cleisthenes, who simply disappears from history, the family lost influence, and a number of members and supporters were ostracized in the 480s, suspected of being too friendly to the tyrants and to Persia. There was a rumor, rather implausible, that they had been ready to hand Athens over to the Persians in 490.

In the fifth century the family was less prominent, but Pericles' mother Agariste and Alcibiades' mother Deinomache were both daughters of Alcmaeonids. This connection was sufficient in 432 for the Spartans to suggest that, given the family curse incurred with the killing of Cylon's

supporters, the Athenians should expel Pericles. The Athenians did not comply.

Alcohol

“Water is best” (*ariston men hydor*): these lines open the first Olympian Ode of Pindar. Indeed, the evidence for Greeks drinking heavily before battle is limited to one incident. Xenophon relates that before the battle of Leuctra in 371, Cleombrotus the Lacedaemonian king held his last council after the morning meal, and there was a rumor that because they had been drinking wine, they were somewhat spurred on. Wine was consumed on a daily basis in the ancient Mediterranean. Two *kotylai* (about a pint) of wine was the allowance permitted by the Athenians to the Lacedaemonian soldiers stranded on the island of Sphacteria.

In his *Cyropaedia*, Xenophon recommends the general should order wine to be carried on campaign only in sufficient quantity to wean the soldiers off their dependence on it, and this seems to have been normal Greek (and Carthaginian) practice. Wine was rather to be drunk after battle. Hecuba brings her son Hector a cup of wine “a great comfort to a weary man; you must be exhausted after fighting as hard for your loved ones” (Homer, *Iliad* 6.261–262). Greek soldiers of the Classical Period were generally responsible for supplying their own rations, wine included.

Alexander I Balas (b. ca. 173; Reigned 150–145)

Balas was a youth of allegedly obscure, low-class origins who ca. 152 was used by the kings of Pergamum and Egypt against their common enemy, the Seleucid Demetrius I. He was purportedly a son of Antiochus IV (reigned 175–164) and had earlier secured the backing of Rome. In a two-year war, using foreign troops, Balas won the support of the population of Antioch, the Seleucid capital, and defeated and killed Demetrius, who was deserted in battle by his own troops. At the age of 23, he took the regal name of Alexander, and among other titles, styled himself Theopater Euergetes (“With a God for his Father, Benefactor”). To the populace however he remained Balas.

His reign was discredited by factionalism and intrigue at court. Genial and pleasure-loving, Balas did not command respect. When Demetrius, son of the late king, invaded with an army of mercenaries (ca. 147) Balas’ only solid support was from the Jewish leader Jonathan. Successes won by Jewish forces and concessions Balas granted to Jonathan alienated his Greek subjects even more. Balas also lost the support of his former backer Ptolemy VI, who was instrumental in having Demetrius accepted as king. After Balas was driven out of the capital, he attempted an assault on Antioch with an army raised in Cilicia but was defeated, betrayed, and murdered.

Balas (the name may be Semitic in origin) is a puzzling figure—his origins remain an unsolved mystery. Before becoming king he showed remarkable diplomatic persuasiveness but in the event was unable to secure the loyalty of the army or the population of Antioch, both essential for a Seleucid ruler.

Alexander I of Epirus (370–331)

A Molossian king of the Aeacid dynasty in Epirus, Alexander, the son of King Neoptolemus I, was born in 370. Upon his death, Neoptolemus was succeeded by his brother Arybbas in 359, likely due to Alexander's youth. Arybbas formed a diplomatic alliance with Philip II of Macedon, sealed by the marriage of Alexander's sister, Olympias, to Philip. This marriage resulted in the birth of Alexander III (the Great) of Macedon. To curry favor with the Macedonians Alexander was sent to be educated at Philip's court. He seized the throne from Arybbas in 350 with the help of Philip II of Macedon. Alexander is credited with the unification of the Epirote tribes under the Molossians. When Olympias fell out of favor with Philip in 337, Alexander offered her asylum in Epirus. Alexander secured his ties with Macedon by marrying Cleopatra, Philip and Olympias' daughter, in 336.

Alexander was responsible for the Epirotes' involvement in the Samnite Wars. The inhabitants of Tarentum were under attack by the Samnites in 334 and sent a call for aid to Alexander. The Samnites had begun to raid and invade the territory of the other Greek colonies in Italy as well. Alexander secured an alliance with Rome against the Samnites and Lucanians in 332. Alexander's campaigns freed Heraclea, Sipontum, Consentia, and Terina. Despite his initial successes in Italy, Alexander was killed in 331 at Pandosia near the River Acheron, as was foretold by the oracle at Delphi. As he had no heirs, Epirus became a protectorate of Macedon.

Alexander I of Macedon (d. ca. 452)

Alexander I of Macedon (reigned ca. 495–452) first appears in our sources as a prince who killed Persian ambassadors because they mistreated Macedonian women at a banquet. Despite this, as king, Alexander provided tangible help to Xerxes' invasion in 480. He led Macedon's adherence to Persia and garrisoned Boeotian cities to ensure they supported Xerxes. In winter 480/79, Xerxes selected Alexander to try to bring Athens over to Persia.

According to Herodotus, the night before the battle of Plataea Alexander personally warned the Athenians of the impending Persian attack. If this occurred, then Alexander may have been insuring himself against a Persian defeat. However, the whole tenor of Herodotus' favorable treatment of Alexander seems tinged by his attempts to be regarded as a Greek. This involved Hellenizing his court, emphasizing (or inventing) his Argive ancestry, and participating in Greek festivals like the Olympic Games.

After the war, Alexander added considerable parts of Thrace to Macedon, including valuable mines (478–476). Although Alexander seems to have lost them for some time by ca. 462, his temporary control laid the economic foundation for prosperity and future expansion. However, his moves into the upper Strymon River ended previously good relations with the Athenians, who also wanted the region. He apparently lost ground there because of Thracian and Athenian opposition. Despite his apparent loss of the mines after ca. 460, when Alexander died (ca. 452)—either killed in battle or murdered, he left Macedon in a much stronger economic and military position than when he came to the throne.

Alexander II of Macedon (d. 368)

Alexander II of Macedon's short reign (370–368) was marked by military reform, which helped create the basis for Philip II (his younger brother) and Alexander the Great's successes, and an over-ambitious attempt to control Thessaly. To remedy Macedonia's long-standing weakness in heavy infantry, Alexander II seems to have established the Foot Companions and introduced hoplite training. In 369, having seized Crannon and Larissa Alexander was forced to withdraw from Thessaly by Ptolemy's rebellion at home. Pelopidas expelled the Macedonian garrisons, forced a settlement between Alexander and Ptolemy, and secured an alliance with Alexander, which involved Philip going to Thebes as a hostage. Alexander was assassinated in 368, probably by Ptolemy.

Alexander II Zabinas (Reigned 128–122)

In 128, the new Seleucid king, Demetrius II's invasion of Egypt to restore his exiled mother-in-law Cleopatra II failed. Cleopatra's brother, King Ptolemy VII Euergetes capitalized on the discontent in the Seleucid kingdom by putting forward a youth named Alexander as supposedly related to the Seleucid royal line and the adopted son of Antiochus VII Sidetes (reigned 139–129). An Egyptian force installed him in the capital Antioch, where the populace gave him the derisory nickname Zabinas (Aramaic for the "Bought-One"). He held the surrounding territory in the Orontes valley but

Demetrius II held the coast, including the city of Seleucia.

In a battle fought near Damascus, Demetrius II was badly beaten by Zabinas' forces and later killed, very probably on Cleopatra's orders. Zabinas, however, was soon eclipsed by Cleopatra, who installed as king one of Demetrius II's sons, Antiochus VIII Grypus (reigned 125–96), and she was the real power behind him. In a civil war that went on for six years neither side prevailed, until finally in 122 Ptolemy VII intervened in force to support Cleopatra and Antiochus VIII. Zabinas was defeated and fled to Antioch. His plundering of the Temple of Zeus at Daphne provoked a riot that drove him out of the city. He was captured by Antiochus VIII and committed suicide by poison.

Dynastic conflict was a constant weakness in the Seleucid kingdom, with no one contender able to impose stability. Intermarriage between the Seleucid and Ptolemaic royal houses gave the latter pretexts for interfering in Seleucid affairs to impose a weak or amenable ruler. Zabinas was a pawn in this ongoing struggle.

Alexander III (the Great) of Macedon (356–323)

Alexander became the Macedonian king when his father, Philip II, was assassinated (October 336), reigning until 323. In 338, Philip's plan to marry Cleopatra estranged Alexander's mother, Olympias, and also caused problems with Alexander. Although this was apparently resolved by the time of Philip's assassination (during the marriage ceremony with Cleopatra), Alexander has been considered a suspect. However, there is no ancient evidence to support this and quite a few others had similar, or even stronger, motives to kill Philip.

Reconstructing Alexander's history can be difficult as his huge successes led to later embellishments and we have no surviving contemporary accounts. Most of the substantial ancient works (Arrian, Curtius Rufus,

Plutarch, and Diodorus) are from around 300–500 years after Alexander. The stories of those who served with him (Callisthenes, Ptolemy, Nearchus, and Aristobulus) survive only as fragments preserved in later writers.

At 14, Alexander began the standard four-year academic and military training for sons of the nobility in the school of Royal Pages. Aristotle was one of Alexander's teachers and a major influence on him. Alexander's first "independent" command (under the guidance of senior officers) was in 340 (aged 16)—a successful subjugation of the Thracian Maedi. In 339, Alexander campaigned with his father in Scythia. A year later, aged 18, Alexander commanded the cavalry on the left wing at the crucial battle of Chaeronea.

Proclaimed king by the Macedonian assembly, Alexander held Philip's funeral and marched south against rebellious movements in various Greek states (including Thessaly, Thebes, and Athens). Alexander's typically rapid and decisive action was completely successful. He was appointed *tagos* (commander in chief) of the Thessalian League and *hegemon* of the Hellenic League. He forgave Thebes and Athens and in Macedon, appointed his own officers and officials, removing or executing those of suspect loyalty. In 335, Alexander reasserted control over the rebellious Triballi, Getae, Dardanians, and Talauntians in the tribal north. He defeated them in a lightning campaign demonstrating his personal bravery, boldness, and great tactical skill. Thebes revolted during this campaign but was captured and destroyed on Alexander's return.

With Greece and the north secured, in 334, Alexander joined the Macedonian forces already in Asia. Alexander's army included important contributions from the Hellenic League, including most of his fleet. Alexander's first success in his seven-year campaign against Persia was destroying its western army at Granicus. Alexander secured the coastline of Asia Minor, liberating the Greek cities there, then disbanded his heavily outnumbered fleet (planning to destroy Persian naval power by capturing its ports) and invaded Caria.

Marble bust of Alexander the Great, dated to ca. 325–300, soon after his death. The bust's pose, with the head tilted up and to the right, is typical of a style popularized by Lysippus, Alexander's favorite portraitist, and typifies the degree to which Alexander was successful in managing his own image. Located in the Archaeological Museum, Pella, Greece. (Jupiterimages)

Ignoring Persian maritime successes in the Aegean Sea, during winter 334/3, Alexander took southern Asia Minor and advanced north to Phrygia (via Pisidia). Alexander next advanced through Cilicia. At Issus (November 333) Alexander destroyed a large Persian army under Darius III. He then took the coast of Syria and Phoenicia. Persian naval resistance was ended when the final major port, Tyre, fell in July 332. Rejecting Darius' offer to make peace, Alexander moved on to Palestine and Egypt, securing them by November 332. Egypt welcomed him as a liberator.

After making appropriate arrangements to govern his conquests (and

secure his rear), in spring 331 Alexander invaded Mesopotamia. At Gaugamela, Darius was again defeated decisively and fled to Media. Assyria and Persia proper surrendered soon after. That same year, belated risings in mainland Greece (including Agis III of Sparta's) failed. In July 330, Bessus, the satrap of Bactria, murdered Darius III but resistance and a subsequent revolt there delayed Alexander's complete control of the Persian Empire until spring 327. However, Alexander's insatiable desire for conquest and glory immediately led him to invade modern-day Afghanistan and then India.

Pacifying local tribes in the north, Alexander entered India and in his last major battle defeated King Porus at the Hydaspes River (326). Continuing east, his army's refusal to proceed stopped him at the Hyphasis (modern Beas) River. Unable to persuade them to continue, Alexander reluctantly turned around. His route back (south down the Indus River), involved brutal fighting against the local tribes, characterized by severe repression and massacre of resisters. In mid-325, Alexander traveled northwest along the coast, subjecting his army to a frightful crossing of the Gedrosian desert—large numbers of men and camp followers died. The army reached Susa in spring 324, 10 years after it had crossed to Asia. Alexander died, apparently of natural causes, in June 323 before finalizing the reorganization of his conquests.

Alexander's success rested firmly on his father's foundations: the wealth and stability of Macedonia, its dominant position in Greece, an excellent army and some very high quality and experienced senior officers. However, there is no doubting Alexander's military genius and it seems highly unlikely that Philip II would have won the victory over Persia so quickly and completely. Alexander's army gave him a decided advantage, but he consistently displayed mastery at the tactical and strategic levels and was particularly skilled with cavalry attacks. He won every major battle he fought against Illyrians, Greeks, Persians, and Indians, despite often being considerably outnumbered. In addition to the quality of his army, success stemmed from sound planning (including close reconnaissance), an excellent ability to read the course of a battle and act accordingly, and strong elements of personal bravery, inspirational leadership, and a willingness to take calculated risks. Alexander's sieges demonstrate both persistence and innovation. His strategic ability is attested by the sequencing of his Persian invasion, avoiding naval battle in favor of taking

the Persian ports from land, and his rejection of Darius' offer of peace after Issus.

Alexander's military skill was complemented by sound administrative and organizational instincts, although his results here were relatively untested at the time he died. He often preferred to win people over rather than use force and was often generous toward enemies. This was a particular feature of the early part of his career, but Porus is a late example. When opposed, he was quite prepared to make use of massacre and enslavement. This also extended to his personal retinue and his army, where dissent and opposition were often met by execution (or personal violence as in the murder of Cleitus). In later years, he became more authoritarian, evidenced by his demand the Greek states deify him, and his order to restore all exiles. In Asia, Alexander generally adopted local administrative and governance arrangements because they preserved continuity and secured the support of the conquered. However, this did cause unrest among his troops and officers, who were much less comfortable with the adoption of local customs (including dress). Despite this, his policy of founding new cities and settling veterans spread Greek culture and language throughout the east. At the time of his death, he was reputedly planning to conquer the western Mediterranean. His early death and the fragmentation of his conquests under the *diadochoi* (Successors) before his organizational arrangements to govern the empire were consolidated mean that we shall never know if Alexander would have been as successful a ruler as he was a conqueror.

Alexander III (the Great) of Macedon, Bactrian Campaign (330–328/7)

Alexander's campaign in Bactria/Sogdiana/Areia was the final stage of his invasion of the Persian Empire and lasted from mid-330 to the winter of 328/7. These satrapies formed the far northeastern portion of the Persian Empire and shared a common culture and language (with local dialects). Together they covered the present-day areas of northern Afghanistan, Turkmenistan, Uzbekistan, and Tajikistan. The region was wealthy from gold and silver and the silk route, but was largely tribal, often restless, and not always firmly under Persian control. The local tribes were known for their prowess as light cavalry. The campaign was characterized by mobile operations, bitter guerrilla fighting, and frequent uprisings. It also saw increasing opposition to Alexander from within his own ranks—Philotas, Parmenion, several Royal Pages, and the historian Callisthenes were executed after plots to kill Alexander, and Alexander killed his friend Cleitus in a drunken argument. However, Alexander was ultimately successful because of his careful preparation (he had reorganized his army, placing more emphasis on light cavalry and mounted infantry), by restricting hostile movement with new cities settled with Greeks and Macedonians, and by cowing the enemy through a mix of brutality and generosity.

When Alexander reached Areia in summer 330, the satrap, Satibarzanes, surrendered but shortly after raised a general revolt. Satibarzanes escaped Alexander's rapid counter-move but died in a subsequent rebellion. Alexander then campaigned southward into Arachosia and Drangiana,

down to the northern edge of the Gedrosian Desert, and then returned north to present day Kabul. In March 329, he pressed north to Kunduz, surprising Bessus (who had proclaimed himself king of Persia). Crossing the Oxus River (April/May 329), Alexander quickly overran Bactria and Sogdiana; Bessus was surrendered by his own men and Alexander executed him.

However, the region was far from pacified; fierce localized resistance turned into a general uprising in Bactria and Sogdiana, led by Spitamenes and supported by Scythians. Alexander used harsh measures (including massacre and enslavement) to deal with this, while neutralizing the Scythian threat with military settlements and defeating them in a major cavalry engagement. The Scythians made peace but resistance continued around Samarkand.

This pattern of warfare continued with successes on both sides in what was an increasingly bitter struggle. However, by summer 328 Alexander's settlements and mobile tactics led to increasing stability and attracted a flow of Bactrian and Sogdian recruits. Early in 327, Alexander took two major and reputedly impregnable enemy strongholds: the "Sogdian Rock" and the "Rock of Chorienes," thus effectively ending resistance.

The Bactrian campaign completed Alexander's conquest of the Persian Empire and provided a base for invading India. During the course of the campaign, Alexander was wounded twice, and may never have fully recovered. The way he not only adapted to but also anticipated the different type of warfare encountered in the region is further testament to his military skills. Alexander's practice of founding Greco-Macedonian settlements (and training local youths as Macedonian-style soldiers), also significantly reinforced the Greek presence and culture in the region, which remained down to the first century.

Alexander III (the Great) of Macedon, Destruction of Thebes (335)

During his 335 northern campaign, Alexander's recently affirmed domination of Greece began to unravel. Returning exiles spread a rumor of Alexander's death and persuaded Thebes to revolt. If other disaffected states like Aetolia, Athens, and the Peloponnese (including Sparta) followed suit, this would be a serious threat to Alexander's control of Greece. Alexander marched at great speed to Thebes, arriving before the Thebans could raise external support. Gathering his local allies, he waited for the Thebans to make terms.

Although there was some division inside Thebes, the diplomatic option was ended (according to Arrian) when Perdiccas, a Macedonian commander, attacked without orders but was wounded and pushed back by a sortie. Alexander counterattacked the Thebans who were pursuing Perdiccas' men, routed them, and entered the city gates hot on their heels. Alexander's Greek allies had old scores to settle with Thebes and many civilians were killed during the capture. Thebes' punishment was left to the Hellenic League. Old hatreds, stemming back to Thebes' medizing during the 480-479 Persian invasion and harsh action over the years against neighboring Boeotian states, resulted in a vote to destroy Thebes.

The city was razed (except, on Alexander's initiative, for the house of Pindar and his descendants), the survivors enslaved, and all Theban exiles declared outlaws. The Cadmean garrison was retained and the walls of Orchomenus and Plataea (destroyed by Thebes) were rebuilt. The severity of this punishment quickly ended any open unrest elsewhere in Greece.

Alexander III (the Great) of Macedon, Indian Campaign (327–325)

Alexander's invasion of India (327–325) was his final campaign. It involved the conquest of a large part of what is now Pakistan, Kashmir, and the Punjab; only part of this had been subject to Persia. Alexander had no idea of the size of the Indian sub-continent—the Greeks thought India was the easternmost peninsula extending into the Ocean (the sea believed to encircle earth's landmass). The campaign was characterized by hard fighting, the harsh treatment of those who resisted (especially those who had previously agreed to submit), the use of river transport, and the foundation of new cities to cement control. As elsewhere, Alexander appointed trustworthy locals to govern conquered areas while using Macedonians in particularly important regions.

Alexander set off in summer 327, leading part of the army by a more northern route; the larger part under Hephaestion and Perdikkas took the main route via the Khyber Pass. The “Indi” had numerous cities and were militarily strong. Divided into tribes under kings, with a history of internal warfare, they were not united against Alexander. Although the tribes between the border and the Indus River had pledged their allegiance to Alexander's ambassadors, several resisted when he arrived. Alexander treated harshly as rebels the first few cities captured, granting clemency to the next groups who surrendered. The message that he punished resistance soon spread. He subdued, in succession, the Aspasiens, Guraei, and Assaceni. He made a particular point of capturing the “impregnable” Rock of Aornus.

Alexander then moved south and, in spring 326, linked up with Hephaestion and Perdiccas, who had subdued the tribes at the head of the Indus River. Supported by the local ruler Taxiles, Alexander moved east of the Indus; at the same time Kashmir came to terms. Alexander first defeated King Porus, an enemy of Taxiles, at the Hydaspes River. Porus was treated leniently and confirmed as client king in his region. Moving further east Alexander crossed the Chenab River and (near modern Lahore) captured Sangala against stiff opposition. Pressing on, Alexander reached the Hyphasis River (modern Beas)—supposedly the end of India. When they learned that beyond the river was a heavily populated region with large numbers of particularly big and brave war elephants Alexander's troops refused to advance. Alexander tried impassioned speeches and sulking in his tent, but the troops were unmoved and Alexander reluctantly turned back.

Alexander moved south in November 326, transporting his army along the three major rivers, Hydaspes, Indus, and Acesines. This was quicker than land movement and easier for resupply. Alexander moved quickly to prevent his two main threats, the Malli and the Oxydracae, joining together against him. He captured the first Mallian city by surprise, caught the fleeing inhabitants of a second in the open, and took the third after a heavy fight. Anyone who did not quickly surrender was killed. At the next city, Alexander was first over the wall and left isolated there with three others when the ladder broke. Alexander survived, although seriously wounded (an arrow punctured his lung). The enemy garrison was massacred. The Malli's heavy losses and brutal treatment caused almost all the other peoples in the region to come to terms. Moving south down the Indus, Alexander accepted further surrenders and excavated ports. A revolt in his rear by the Brahman religious caste and King Musicanus was rapidly put down. Several cities were enslaved and Musicanus and any Brahmins taken were executed.

Alexander built a large naval base at the mouth of the Indus and in mid-325 set off for Persia, along the coastline. Alexander chose the arid coastal route, the southern part of the Gedrosian desert, partly because no army had successfully done it before. However, the army was also to provide important support to Nearchus' fleet, which was to establish a sea route to Persia. This offered a significant time saving on the overland route via Bactria, would assist in maintaining control over India, and would open up trade. Alexander's army was to march along the coast ensuring the fleet

was not subject to attack, and also to prepare supply dumps and locate water. Although the sea route was successfully opened, the army suffered badly from the heat and lack of water; many died. Alexander reached Susa in spring 324.

The Indian campaign completed Alexander's conquests. His Indian excursion led to no permanent occupation by any of his Successors (the *diadochoi*). However, it did lead to independent Greco-Indian kingdoms that lasted into the first century.

Alexander III (the Great) of Macedon, Invasion of Persian Empire (334–327)

Causes

The idea of invading the Persian Empire and exacting reprisals stemmed from the Persian invasions in 490 and 480–479. The initial view was that the Persians should be punished for the destruction of Greek cities; revenge for the destruction of Greek temples also became an issue. Recompense for these losses was the main stated reason behind the Delian League. However, this soon became inextricably bound up with the idea of freeing the Greeks of Asia Minor from Persian domination. Over his long career, the political writer Isocrates in turn appealed to Athens, Sparta, and Philip II to lead a

panhellenic attack on the natural enemy, Persia, and free the Greeks. Jason of Pherae also considered the idea. Success in this venture would bring Greek gratitude and, more practically, gain recognition as the most powerful state in Greece, and considerable wealth from Persian booty. It would also remove Persia's long-term interference in Greek affairs. Persian policy had been to use money and the threat of force to support whichever Greek states were less likely to focus their attention on Persia (these varied over time). At various points in the fifth and fourth centuries, this had tipped the balance of power in Greece toward those favored by Persia—sometimes Sparta, sometimes its opponents, such as Athens or Thebes. The successes of the Greek mercenaries under Cyrus the Younger (401–399) also encouraged the belief that the Persian Empire was militarily weak. At the time of his death, Alexander's father, Philip II, was preparing an attack on the Persian Empire, in part to unite Greece under him and cement his position as hegemon. Although Alexander the Great's motives are unrecoverable, the desire to achieve this holy grail of panhellenic sentiment, demonstrating his ability to exceed his father's exploits, and put his place as hegemon of Greece beyond question almost certainly played their part. However, Alexander's huge ambition was probably the driving motive and it is highly likely that the scale and speed of his victory far exceeded anything his more cautious father would have attempted.

Course

In 335, Philip II had sent Parmenion, with a force of 10,000 men, across the Hellespont and into Asia Minor. In 334, Alexander joined Parmenion with 32,000 infantry and 5,100 cavalry. The majority of these troops were Macedonian, supplemented by 5,000 mercenary hoplites along with 2,100 cavalry and 7,000 hoplites from the Hellenic League. Assuming that Parmenion's advance force was largely intact in 334, this gave Alexander a land force of around 47,000 men—a large army by Greek standards, but very small compared with Darius III's forces. However, many of Alexander's troops, and officers, were experienced and battle-hardened veterans. A chronic lack of good quality heavy infantry had hampered Persian clashes with Greek armies since 490—solved only by employing Greek mercenaries. With the exception of the Greek mercenary hoplites in Persian pay, the quality of Alexander's Greek and Macedonian infantry far surpassed any infantry fielded by the Persians. Although the Persians had good quality

cavalry, including mounted archers, far outnumbering Alexander's horse, they also lacked the experience, and in many cases the protective armor, of Alexander's troops. Although Alexander's supporting fleet of 160 triremes was heavily outnumbered by the 400-strong Persian fleet (which was backed by a considerable depth of naval resources), it was also of good quality. However, as his Greek allies supplied most of his ships, Alexander had to be careful with their use—a major naval defeat could cause unrest back in Greece.

The risk of problems in Greece influenced Alexander's approach to the invasion. His personal character, already demonstrated prior to the invasion, clearly inclined toward bold and aggressive action. He was a general with big ideas—matched by an ability to clearly read strategic and tactical situations—and an experienced army and officer corps able to execute his plans. This tendency toward bold and swift action was accentuated by the need for quick wins in Asia Minor to ensure no uprising against him in Greece. The small forces he left to secure his position at home in the event proved adequate, but could not have coped against a general revolt.

After absorbing Parmenion's force and securing one month's provisions, Alexander advanced inland, leaving Parmenion in command of his support base. His first major engagement was against the local Persian army of the Hellespont at Granicus. His victory here demonstrated the superiority of his troops and his abilities as a general and opened the way for his advance south down the Ionian coastline. Although some places resisted, in some respects the march down the coastline consisted of bloodlessly liberating Greek cities from Persian rule. Once they were liberated, Alexander enrolled these cities in the Hellenic League. He occupied Sardis, a symbolic blow to the Persians, but had to capture Miletus by force. At Miletus, he disbanded most of his fleet. The main reasons were a lack of money to pay for it and the risk of defeat by the much larger Persian fleet. Alexander kept a small naval contingent for tasks such as securing communications across the Hellespont and ferrying siege engines to Halicarnassus for the next stage of his campaign—the conquest of Caria—but had effectively abandoned the sea to the Persians. His plan was quite simple—he had decided to neutralize the Persian navy by capturing all its ports. However, in the interim this handed control of the Aegean to the Persians who occupied Samos and then Chios.

A feature of this part of the campaign was replacing the ruling oligarchies in many liberated Greek cities with democracies (there were

some exceptions, for example Rhodes), and sending spoils of captured Persian arms and armor home to Greece. Sacrifices to key Greek gods at important sites such as Troy also helped emphasize to those back home the panhellenic aspect of his invasion. In Persian areas, Alexander retained the existing Persian system, supplanting the Great King as supreme authority and generally appointing Macedonians as satraps, although in some case retaining locals in this role. In Caria, for example, the queen mother, Ada, adopted Alexander as her son and was appointed as satrap. Although he had little time to change the existing system, retaining it also had considerable advantages—it was what the locals were used to and gave him the same prestige, power, and authority enjoyed by the Persian king. As he conquered more Persian territory, Alexander generally employed this same methodology in administering his conquests, although in some cases a local satrap was coupled with a Macedonian who commanded the military forces.

Alexander overcame stiff resistance at Halicarnassus, the main city of Caria, but the leaders there, Memnon (a Greek in Persian service) and Orontopates, the satrap of Caria, escaped. This was unfortunate as Memnon took over command of the Persian naval effort, proving a vigorous opponent until his death from illness and Orontopates continued to oppose the Macedonian occupation until 332. Alexander continued to press his attack over the winter of 334/3, conquering southern Asia Minor and moving north through Pisidia into Phrygia. At this time the Persian success at sea faltered, not only with the death of Memnon but also because the Greek mercenaries with the fleet were ordered back to the mainland to stiffen the Persian army. Alexander's advance was delayed by an illness but he then pressed on through Cilicia. At this point he was keen to defeat the Persian army, and hopefully Darius himself if he led it personally. This would confirm his success to date, and allow him to either move against the Persian heartland to the east or south to Phoenicia and Syria. By moving south he could eliminate the main source of Persian naval power, Phoenicia, relieving the pressure on the island states and, as a bonus, open the route to Egypt. He could do neither without inflicting a major defeat on the Persian land forces in Cilicia—these barred his way east and would be a major threat to his rear if he moved south.

Mosaic ca. 100, perhaps based on a fourth-century Greek painting, depicting Alexander the Great's victory over the Persians at Issus in 333, House of the Faun, Pompeii. Reflecting Greek views of the Persians, it shows Darius III in some panic trying to flee from the Macedonian phalanx behind him (represented by the sarissae [long spears] in the background) while Alexander the Great is desperately trying to reach him from the flank. Located in the National Archaeological Museum, Naples, Italy. (Jupiterimages)

In November 333, Alexander achieved his immediate aim by destroying a large Persian army, led by Darius, at the battle of Issus (see illustration). Although Darius had outmaneuvered Alexander by appearing in his rear, he was unable to capitalize on this. Issus opened up Alexander's way south and Alexander decided to move down the Phoenician and Syrian coastline. One factor here was to complete his strategy of neutralizing Persian naval power by capturing its major ports and sources of ships and seamen—the maritime cities of Phoenicia (modern Lebanon). News of his victory over the far larger Persian army and the Great King himself preceded him and he occupied most of the coast, including the port-cities of Byblos and Sidon, without real opposition. The exception to this was Tyre, the most important port in Phoenicia. Relying on its fleet, strong walls, and its secure position on an island just off the coast, the city refused to surrender. However, the ships from Byblos and Sidon, and another 120 from Cyprus (which joined him after Issus) gave Alexander control of the sea. The city fell in July 332 after a bitter seven-month siege, during which the Macedonians attacked

from both the landward side, using a stone causeway they had constructed, and from the seaward side with siege engines mounted on ships. Although Alexander generally treated cities that surrendered leniently, serious resistance, as at Tyre, was often harshly punished. At Tyre, many of the citizens were killed in the assault and the rest sold as slaves. The loss of Tyre meant the end of any effective Persian naval resistance, ending the threat to the Greek islands and the risk of direct Persian interference in mainland Greece. During the siege, Darius offered Alexander a large cash payment (10,000 talents) and all Persian territory west of the Euphrates in return for peace and the return of the Persian royal women captured after Issus. This was a very generous offer but Alexander famously rejected it (Quotable Quote 8). Despite his success to date, this was a bold move, but the rest of the campaign justified his confidence.

Alexander pressed on south and by November 332, a year after Issus, had captured Palestine, taking the main city of Gaza after another hard-fought siege (see illustration in Art (Ancient), Greek Warfare in) —the survivors were sold into slavery—and then occupying Egypt. The satrap of Egypt surrendered without a fight—the Egyptians had a long history of rebellion from the Persians and welcomed Alexander as a liberator. In return he treated them well, respecting their cults, sacrificing to their gods, and building a temple to Isis. This was typical of how he secured loyalty in his conquests and the Egyptian priests crowned him pharaoh. However, he also divided power in Egypt between six governors. Two, with military power, were Macedonian, while two Greek and two Egyptian governors exercised civil power. He also founded the city of Alexandria. The combination of measures to secure loyalty—respect for local religion and customs, maintaining Macedonian control of military power, and new settlements were features of his successful control of conquered regions. His travel through Egypt included a visit to the shrine of Re, whom the Greeks regarded as Zeus, at Ammon. There the rumor spread that the god had recognized Alexander as his son.

By spring 331, Alexander was back in Tyre. To secure his rear before he advanced to finish Darius and take Persia proper, he finalized the arrangements (administrative, military, and financial) necessary to smoothly run his conquests to date. The next stage of his invasion went completely according to plan. Alexander's army was now 40,000 infantry and 7,000 cavalry, while Darius' military sources had shrunk to what he could draw

on from Mesopotamia and the western parts of his empire, such as Bactria. Although Darius' forces still outnumbered his opponent, Alexander had a major qualitative edge. This, and Darius' loss of access to Greek mercenary infantry, led to the third major Persian defeat at Gaugamela in October 331. This was a decisive defeat, although Darius again managed to elude capture. Alexander followed him up, first accepting the surrender of Babylon, ending the long link between the Assyrians and Persians, the core of the Persian Empire, and then occupied the Persian capital, Susa. There, the center of government, including the Persian treasury came under his control. The rest of the Persian heartland followed, including the royal palace at Persepolis, which Alexander burned (an act he later regretted). Too late for the Persians (or for any real chance of success), trouble erupted back in Greece, where Antipater, Alexander's commander had to put down two rebellions. The first was a rising by the Odrysians in Thrace, the second a rebellion, financed by Persian gold, centered on Sparta and led by King Agis III.

Alexander did not catch up with Darius until July 330, deep in the northeast of the Persian Empire. The pursuit ended in the Persian king's assassination by Bessus, the satrap of Bactria. Bessus led resistance in Bactria until his capture and execution in 328. Even this, though, did not give Alexander full control of the entire Persian Empire. This had to wait until spring 327 when Alexander finally suppressed a serious revolt led by Spitamenes in Bactria and Sogdiana. Once this was done, Alexander decided to extend the boundaries of the empire east and in summer 327 crossed into modern-day Afghanistan to invade India.

Consequences

The outcome of this invasion was the destruction of the Achaemenid Persian Empire and its removal as a factor in internal Greek relations. It resulted in the spread of Greek/Macedonian culture and language deep into Asia Minor and the removal of Greek states in Asia Minor from Persian control. In the short term, it led Alexander on to further conquests in the east—Afghanistan and India. In the long term, it saw the Persian Empire replaced by a range of Macedonian-led successor states. None of the *diadochoi* (Alexander's Successors) was ever able to control the whole empire, which was essentially divided between the Antigonids, Seleucids, Ptolemies, and a variety of smaller states.

Alexander III (the Great) of Macedon, Thrace and Illyria Campaigns (336)

After becoming king of Macedon, Alexander III's first operation was to subdue the Thracian and Illyrian tribes to the north of Macedon. This campaign pacified the borders of Macedon so Alexander could invade Persia without worry.

The first opposition to Alexander's advance in spring 336 was from Thracians on Mount Haemus who had prepared wagons to send down at Alexander's army and disrupt his phalanx. Alexander had the phalanx make lanes for the wagons to pass through and the hypaspists lie under their shields and allow the wagons to bounce over them. Once the wagons had passed, the missile troops on the flanks harassed the Thracians to give time for the phalanx to re-form. The whole army then assaulted the Thracians at

the summit, easily forcing them into retreat. Alexander then came upon the Triballi camped by a river and arrayed for battle in a glen. Alexander's missile infantry drew the Triballi out into the open and then the cavalry attacked on the wings and the phalanx in the center; the enemy quickly fled. At the Danube, Alexander was opposed by some Thracians across the river. After an initial attack was repulsed, that night Alexander led 4,000 infantry and 1,500 cavalry across the river on improvised boats and rafts. Alexander attacked the enemy camp at dawn and the Thracians fled. Most of the local tribes quickly submitted.

In Illyria, Alexander formed a lasting alliance with the king of the Agrianians, who subdued his neighbors and provided a force of javelin men that became one of Alexander's most trusted units. Alexander marched against two Illyrian kings, Cleitus and Glaucias. Cleitus was besieged but Glaucias arrived with a strong force threatening to trap Alexander between them. Alexander, unable to face both forces at the same time, drew up his army and drilled them silently on the plain below the heights. The enemy came out to watch and fled when the Macedonians attacked them. The Illyrians still commanded the heights, threatening Alexander's ability to ford the nearby river. Alexander ordered his cavalry to attack the enemy horsemen, and fight on foot if they stood their ground. The Illyrians simply moved to hills on either side so Alexander, from the captured hill, sent light infantry across the river followed by hypaspists and the phalanx. When the Illyrians attacked the rear, Alexander's cavalry charged from the hill and the phalanx turned back to trap the Illyrians in between. The Illyrians fled and Alexander succeeded in crossing the river under the cover of missiles from the artillery on the bank and the archers midstream. The two Illyrian forces then merged thinking that Alexander had retreated. Alexander advanced rapidly with his best light troops and attacked the undefended camp at night finding the enemy still in their beds. This decisive defeat ended the campaign, allowing Alexander to focus his attention on Persia.

Alexander of Pherae (d. ca. 357)

Alexander of Pherae took on the roles, as tyrant of Pherae and *tagos* (commander in chief) of Thessaly, earlier held by Jason of Pherae. As tyrant, he acquired in our surviving sources a notable reputation for brutality—perhaps exaggerated by his opponents. Alexander became tyrant by murdering his predecessor, Polyphron, and cemented his position by marrying Jason's daughter, Thebe. The other Thessalian cities bitterly contested his efforts to take over Jason's position as ruler of Thessaly, and the powerful Aleuadae of Larissa enlisted Macedonian intervention against him. Alexander's reputation for brutality partly rested on having slaughtered the men of military age of two small Thessalian towns, Meliboea and Scotussa.

Alexander's Thessalian opponents also sought help from the Thebans, who sent diplomatic missions and small forces against him. These were ineffectual, and the Theban general Pelopidas spent time as a prisoner in Pherae after Alexander seized him during a meeting. The mid-360s saw Alexander at the height of his power, in alliance with Athens. Finally in 364, Pelopidas led a force that combined with Thebes' Thessalian allies to defeat Alexander at Cynoscephalae. Losses in Alexander's army were considerable, but Pelopidas himself was killed trying to reach the tyrant.

Now finally a new, larger Theban expedition forced Alexander to withdraw from most of his possessions and ally with Thebes. He was subsequently found fighting the Athenians in the Aegean, but his power was by then greatly truncated. In around 357, for motives that remain unclear, Thebe enlisted her three brothers to help her murder Alexander

while he was in his bed drunk and asleep.

Alexandria, Egypt

A coastal city in the Nile Delta, founded by Alexander the Great in 332/1 immediately after his conquest of Egypt. Accounts vary—from the romantic to the sober—about how much of the city was planned by Alexander personally, although he did employ the architect Deinocrates as an urban planner for the site. At the least, Alexander recognized the need for the Mediterranean coast of Egypt to have a better port, large enough to berth his fleet, and the importance of connections with Europe via the sea.

It was not until Ptolemy I Soter controlled Egypt and buried the body of Alexander at Alexandria that the city became the *de facto* capital of Ptolemaic Egypt, in place of Memphis. It became one of the most important sites of Hellenism in the ancient world and remained the most important city in Egypt until its conquest by the Arabs in 641 CE. In Hellenistic and Roman times, it was a great center for education, culture, and commerce.

The lengthy occupation of the site has made the original plan of Alexandria difficult to discern. The city was built on a narrow spit of land between the Mediterranean and Lake Mareotis, to the west of the Nile’s westernmost mouth. The island of Pharos was joined to the mainland by an artificial mole, which formed two well-protected and spacious harbors; the city was arranged along the eastern one.

The city quickly grew in size, and despite having a mixture of Egyptians and Greeks, and a sizable Jewish population, the city’s culture remained firmly Greek in its outlook. Greek festivals, religion, and culture were

asserted over those of the Egyptians. Unsurprisingly, Alexandria was the epicenter for many revolts under the Ptolemies, especially during the reign of Ptolemy IV Philopator.

Alliances/Allies (*Symmachiai/Symmachoi*)

The word *symmachos*, “ally” (plural *symmachoi*) literally means “one who fights with,” though alliances (*symmachiai*, sing. *symmachia*) eventually had a wider meaning. It probably originally referred to a friend who joined an aristocrat in his personal feuding and war-making. Often such friends would be aristocrats from other cities, and eventually the word came to refer to a friendly state. *Symmachia* had its origins in older, broader, reciprocal relationships of *philia* (“friendship”) and *xenia* (“guest friendship”). The earliest *symmachia* of which we hear was between Miletus and the Lydian king Alyattes, around 550. An early *symmachia* between states for which we have documentary evidence is one inscribed on a bronze tablet from Olympia, dating to around 500. It was between Elis and Heraea (an Arcadian town), who agreed to stand with each other in everything, but especially in war: if either failed, they were to pay a talent of silver to Olympian Zeus (*GHI*, no. 17).

A *symmachia* between unequal allies could easily become a form of imperialism. Sparta’s Peloponnesian League was constructed out of a series of bilateral alliances between Sparta and individual allied states: ancient sources commonly refer to it as “the Lacedaemonians and their allies.” The

allies voted on common action (perhaps seen as a necessary precursor after the Corinthians pulled out of Cleomenes' expedition against Athens in 506), but Sparta had the final say on League action, as seen in Thucydides' account of the decision in 432 to fight the Second Peloponnesian War. Thucydides has the Corinthians speak very frankly to the Spartans, but like all Thucydides' speeches this is probably largely made up, so it may be that in reality relations were somewhat more obsequious. Fifth century examples of Spartan treaties include provisions that the allied state will follow the Spartans wherever they lead, have the same friends and enemies, and not shirk in fighting Sparta's enemies. Sparta would promise to defend the other state, but not to take part in its offensive wars: the relationship was fundamentally unequal. Treaties may also have included clauses about not receiving exiles from the other state, or, in the case of one from Crete, a clause about the division of spoils from any war fought (*GHI*, no. 42).

In 481, the Greeks who refused to submit to Persia by offering earth and water made an informal alliance with each other, swearing oaths that they would force the medizing Greeks to pay a tithe to Delphi. Only as the threat became more real, when Xerxes arrived in Sardis, did they further agree to end wars between themselves (such as that between Aegina and Athens). Even in such desperate times, the question of leadership (*hegemonia*) of the alliance remained an issue: most states supported Sparta as leader, but Argos refused to join unless it shared the *hegemonia*; the Spartans refused, and the Argives remained neutral. A similar story is told about a failed approach for support to Gelon, tyrant of Syracuse. These stories are illustrative of the way the relative status of cities was a constant factor in alliance-making.

Athens' Delian League, set up in 478/7, was known in antiquity as "the Athenians and their allies" and initially the allies entered freely into, it seems, individual alliances with Athens. Athens decided which allies should provide ships and which should make monetary contributions, and assessed the latter, but the allies had a say in the League's activities through meetings held at Delos. However, it soon became clear that Athens would not allow allies to leave the alliance, which steadily became more oppressive, so that by the later fifth century the league was commonly referred to as the Athenian *arche*, "rule" (but commonly translated as "empire"). In the fourth century, the Second Athenian Confederacy was set up along similar lines, though with more safeguards built in to protect allied

rights.

By Thucydides' time, a distinction was sometimes made between a *symmachia* and an *epimachia*. A *symmachia* implied an obligation to take part in campaigns together, including offensive ones against a third party, while an *epimachia* was a purely defensive alliance (but *symmachia*, as the more general term, could sometimes retain the latter meaning). For example, in 433 when the Athenians wanted Corcyra as an ally, but did not want to offend Corinth, they were careful to form an *epimachia* with Corcyra, meaning that they would come to each other's aid if attacked. This was not entirely successful, as Athenian ships still fought against Corinthians at the battle of Sybota. In 420 the Corinthians, unwilling to be drawn into offensive war against Sparta, explicitly agreed only to a defensive alliance with Elis, Argos, and Mantinea. Alliances between equals were most often only defensive; the Delian League, notionally among equals, was an exception.

In 338, Philip II of Macedon set up a generally similar alliance to prosecute his foreshadowed campaign against Persia. Known as the Hellenic League or, from the city where it was set up, the League of Corinth, it was a *symmachia* within which allied states sat in a common council and contributed militarily. It differed from earlier alliances in that it incorporated a Common Peace agreement, banning member states from fighting each other and requiring all members to come to the aid of one who was attacked.

In the period after Alexander alliances became far less stable, as the *diadochoi* (Successors) to Alexander and the Hellenistic kings who followed them made and broke alliances repeatedly for short-term gain. In reality, of course, alliances had always tended to break down once the parties' interests differed significantly. In earlier periods, treaties were generally made for a specific length of time, though this could be as long as a century; in the fourth century, however, it became increasingly common to draw up treaties that were supposed to last forever (as indeed had been the intention with the Delian League in the fifth century). Clearly, when an alliance was made the exact wording was important. One side or the other might produce a draft treaty, which could then be the basis for negotiations. The Greeks often liked to have a preliminary stage of informal negotiations. At Athens, for example, foreign envoys might first consult the *Boule* (Council of 500), and then if negotiations proceeded satisfactorily, more specific

proposals would be put before the Assembly. In 346, the first Athenian embassy to Philip II of Macedon was sent “to converse with Philip regarding peace and the common interests of the Athenians and Philip” (Aeschines 2 [*On the Embassy*] 18).

The Greeks did not have an extensive vocabulary to describe treaties and treaty-making. In fact, the most common word for a treaty was *spondai*, “libations.” To make a libation was to pour a small quantity of wine onto the ground as an offering to the gods; this was a normal part of the ritual of swearing to a new treaty, and thus came to refer to the treaty itself. Treaties were presumably always in Classical times kept in a written format, and in many states they would be inscribed on a durable material, as in the case of the bronze tablet from Olympia referred to above. In the Peace of Nicias in 421, Athens and Sparta agreed to set up inscribed versions of the terms (on stone) at Olympia, Delphi, and Isthmia (a sanctuary at the Isthmus of Corinth). Many inscribed treaties have been found in Athens, but examples are also known from other places, especially the great sanctuaries.

When one party wished to renounce an alliance, they might simply take action such as revolting. But sometimes there was an explicit repudiation of a treaty: for example, in 340 when the Athenians wished to renounce their alliance with Philip II, they voted to pull down the pillar on which the Peace of Philocrates of 346 was inscribed.

Alyattes, King of Lydia (ca. 610–560)

Alyattes, the son of Sadyattes, father of Croesus of Lydia, and father-in-law of Astyages (Cyrus' grandfather), continued a war Sadyattes had begun six years previously with the Ionian city of Miletus. Because Miletus had direct access to the sea, Alyattes did not besiege the city, but wore it down for five years by constant depredations on its crops. In the twelfth year, Alyattes became ill and wished to arrange a truce with Thrasybulus, the tyrant of Miletus. A Lydian herald arrived at Miletus to find that, contrary to Alyattes' expectations, food supplies seemed abundant. This was a ruse devised by Thrasybulus to deceive the Lydians. As a result, peace terms were reached.

Herodotus relates the circumstances of Alyattes' illness, which was believed to have been a divine punishment for the destruction of a temple of Athena. Alyattes is said to have built two temples to Athena in Assesus.

Alyattes also fought against Cyaxares of the Medes. Alyattes harbored some Scythian fugitives from Cyaxares. The war lasted for five years, and ended in the middle of a battle because of an eclipse, the timing of which Thales of Miletus had calculated. Alyattes' daughter, Aryenis, married Cyaxares' son, Astyages, to strengthen ties between the Lydians and Medes.

Alyattes was also renowned for having a large tomb in Lydia, and for receiving prospective eunuchs in Sardis.

Amazons

The Amazons were a mythical tribe of female warriors. Formidable and dangerous figures: the Amazon fought, hunted, and gloried in war. Underlying the Amazons' martial preeminence is a Greek anxiety about social boundaries: Amazons are women who undermine the conventional Greek model of women's proper roles. Inevitably they are defeated in every encounter against the Greeks.

Amazons are scarce in Greek literature (exceptions are accounts by Herodotus and Hippocrates). They are however immensely popular in art, particularly in Athens. Several mythical heroes encounter the Amazons; three (Heracles, Achilles, and Theseus) appear in art. All Amazonomachies (battles between Greeks and Amazons) are assumed to depict one of these three battles, although it is often impossible to tell which. Amazons always lose, although individual Amazons may be shown as victorious within this overall context of defeat.

Amazons in literature are usually described as light-armed cavalry—a reversal of the Greek hoplite. Art is more varied. At first they are depicted as heavy-armed hoplites. Later, elements of Thracian or Scythian armor appear. After the Persian Wars, Persian costume is also shown.

The ideology of the battle changes over time. The earliest Amazonomachies reflect the prowess of Greeks against outsiders generally. After the Persian Wars, the Amazonomachy is used to evoke Athens' part in the defeat of the Persians; consequently, the Amazons' attack on Athens, seeking revenge on Theseus, largely supplants other representations. Persians and Amazons were considered to share multiple characteristics, such as their method of fighting, Eastern origins, and (more controversially) lack of *sophrosyne* (restraint). The scope of the theme is debated. By the fourth century, the Amazonomachy also represents the defensive use of righteous violence by the Athenians against other Greeks.

Ambracia and Amphilochia

The Ambracian Gulf, near the mouth of which the battle of Actium was fought in 31, separates Acarnania to the south from Epirus to the north. At its eastern end was a mountainous area known as Amphilochia, with its largest city, Amphilochian Argos, near the eastern end of the gulf. Ambracia was a city dominating a large plain north of the gulf.

Ambracia was a Corinthian colony, and remained close to its mother city. In 480, it joined the fight against the Persians, sending seven ships to Salamis and 500 men to Plataea. The Amphilochians, on the other hand, were considered non-Greek in origin. According to Thucydides, sometime perhaps around 440 the people of Amphilochian Argos accepted Ambraciot settlers and the city became Hellenized. In Thucydides’ own day, the historian tells us, the people of Argos spoke Greek while the rest of the Amphilochians were still non-Greek-speakers. But the new settlers took over the town, and the Amphilochians brought in Acarnanian and Athenian help. The Athenian Phormio arrived with 30 ships, took the town, and enslaved the Ambraciot settlers. The town was now repopulated with Amphilochians and Acarnanians.

The Second Peloponnesian War was a period of further conflict. Ambracia supported Corinth against Corcyra, and consistently supported Sparta during the war. In 430, the Ambraciots, with help from unspecified barbarians, tried but failed to take Argos. In winter 426/5, the Ambraciots arranged with a Spartan commander, Eurylochus, to make a joint attack on Argos, to get rid of Acarnanian and Athenian influence in the area altogether. For their part, the Amphilochians called in Athenian help, and the Athenians arrived with 20 ships and 600 Messenian hoplites from

Naupactus. The Athenian general Demosthenes took command of the Amphilochians and their allies. The resulting battle of Olpae ended disastrously for the Spartans and Ambraciots, and Eurylochus was killed. Demosthenes then surprised and destroyed a relief force sent out from Ambracia. Thucydides comments that Ambracia had suffered the greatest disaster over a few days of any city in the war. Wary of the Athenians obtaining a foothold in the area, the Acarnanians and Amphilochians refrained from capturing Ambracia, and the three parties agreed to a 100-year defensive alliance. The sequence of events is a good example of the sort of local disasters that the conflict of the great powers, Athens and Sparta, inflicted on many parts of Greece.

Ambracia remained loyal to Corinth in the Corinthian War. In the third century, the area came under the rule of Pyrrhus, king of Epirus, and he made Ambracia his capital. From about 229 to 167, it was part of the Aetolian League, before coming under Roman rule. After the battle of Actium, fought near the mouth of the Ambracian Gulf in 31, Ambracia helped provide the population of Augustus' new foundation, Nicopolis, which became the dominant city in the area.

Amompharetus (d. 479?)

Amompharetus played a central role in the battle of Plataea (479). According to Herodotus, who presents rather a confused account of the battle, Amompharetus disrupted the Greek night withdrawal to better

positions ahead of a general Persian attack. The Greek center, the bulk of the army, withdrew further than agreed and on the right, Amompharetus, who commanded the Pitanate *lochos* (one of the five Spartan *lochoi*) refused to withdraw. Herodotus records a heated debate, during which Amompharetus threw a rock at Pausanias' feet, stating he was casting a vote to stay. Pausanias eventually withdrew, presuming (correctly) that Amompharetus would follow when he realized his *lochos* was alone. Amompharetus had almost caught up to the rest at daybreak when the Persians attacked. Despite the Greek confusion, the Persians were decisively beaten. Herodotus implies that Amompharetus was killed in the battle.

There are some issues with the details of Herodotus' depiction of Amompharetus. The Athenians, not Spartans, used pebbles to vote and Thucydides claims there was no such Spartan unit as the "Pitanate *lochos*." This may have been the case in his time, but not necessarily at the time of Plataea, and Herodotus had certainly visited Pitane. Although certainly dramatized, it is quite possible that the core of Herodotus' story is correct.

Amphipolis

An important city on the River Strymon, about 4 kilometers (2.5 miles) inland and controlling the coastal route from Greece and Macedonia to Asia Minor and a good trade route inland to the Thracian tribes. Nearby were gold and silver mines at Mount Pangaeum and good timber for shipbuilding. Traces of much earlier habitation exist and a fifth-century Thracian settlement of the Edonians is known there—Amphipolis was Greek only from 437/6. In that year an Athenian, Hagnon, founded a colony there that included many non-Athenians. It replaced the existing Edonian settlement of Ennea Hodoi (Nine Ways) and was the third known Greek

attempt to colonize the region. The first, led by Aristagoras of Miletus, was defeated by the Edonians in 497. A later 10,000-strong Athenian expedition had initial success but in 465 was destroyed north of Amphipolis at a place called Drabescus.

Located on a plateau above a bend in the river, which surrounded it on three sides, and with a port, Eion, at the mouth of the Strymon, Amphipolis was a prosperous and important part of the Athenian Empire. When it was lost during the Peloponnesian War of 431–404 the Athenian obsession with regaining it, first from Sparta and then as an independent city, dominated their policy in the region for over 70 years. In the mid-fourth century, Athens and Philip II of Macedon struggled for control of a still independent Amphipolis.

Despite the fact that Amphipolis had an Athenian founder, and was part of the Athenian Empire, by 424 the non-Athenian elements were in a majority and it fell bloodlessly to the Spartans under Brasidas. From that point, Amphipolis enthusiastically supported the Peloponnesians. An Athenian army under Cleon was defeated while attempting to recover Amphipolis in 422 and although it was returned to Athens under the terms of the Peace of Nicias (421) the inhabitants refused to comply. An alliance with neighboring Olynthus helped Amphipolis remain free from Athens, despite intermittent but vigorous efforts to retrieve it. The last major military attempt under Timotheus (360) failed and in 357 the city was taken by Philip II of Macedon. It remained Macedonian until 167, when Rome freed it as part of its dismemberment of Macedon after the Third Macedonian War. Amphipolis was a naval base under Alexander the Great—his fleet sailed from there against Persia and three of his admirals, Nearchus, Androstenes, and Laomedon, were from or associated with the city. Alexander's wife Roxane, and infant son, Alexander IV were murdered at Amphipolis on Cassander's orders.

Remains of the ancient timber bridge over the River Strymon at Amphipolis. Thucydides describes the capture of the bridge as a key moment in Brasidas' successful assault on the town in 424. Its location at the crossing point of the river added to Amphipolis' value as a center of communications. The bridge, whose antiquity has been confirmed by radiocarbon dating, was 13 to 19 feet wide. Amphipolis, Campaign of (424–422)

The Amphipolis campaign of the Peloponnesian War of 431–404 led to the Peace of Nicias (421) and Athenian loss of control in the region. The campaign stemmed from Athenian threats to execute the Spartans captured on Sphacteria if Sparta invaded Attica again. Looking for an alternative theater of operations, Sparta selected Amphipolis because of its prosperity

and importance to the Athenian Empire, and its accessibility by land. Strategically situated astride the coastal route to Asia Minor it was also economically important, both for its trade route to inland Thrace and its natural resources.

Despite the fact it was an Athenian-led colony (founded 437–436), by 424 the Athenians were in a minority there and Amphipolis surrendered without a fight to a Spartan army under Brasidas. Brasidas' arrival was a complete surprise—the Athenian commander in the region, Thucydides (the historian), was at Thasos with his ships and the inhabitants had no time to move their animals and other possessions that were outside the walls to safety. The threats to their external property, including crops and fruit trees, and Brasidas' moderate terms persuaded them to surrender.

Although Thucydides managed to secure Eion and repelled Brasidas' attack on it, the loss of Amphipolis was so important that in 423 the Athenians agreed to a truce with Sparta. However, hostilities continued in the north as Scione and Mende revolted from Athens after the truce was signed. Athens sent north a force of 50 ships with 1,000 Athenian hoplites plus 600 archers, and 1,000 Thracian mercenaries. Reinforced with peltasts from their local allies, the Athenians recaptured Mende while Brasidas was campaigning with Perdiccas of Macedon against the Lyncestians.

The following year (422), Cleon persuaded the Athenian assembly to send reinforcements to recover Amphipolis and the other states in the region. Thucydides provides the principal account of the campaign. Thucydides was a contemporary of Cleon's who clearly disliked him and this has led to modern attempts to portray the expedition as more successful than Thucydides allows. However, it was a failure. Cleon had 1,200 hoplites, 300 cavalry, and 30 ships plus an unknown but large number of allies. Joining the troops in Mende, Cleon had some good initial successes, recovering Galepsus and Torone. It is also possible he recaptured another half-dozen or so places, which Thucydides chose not to record—although many of these were pretty small and the evidence for their revolt and recapture is open to debate.

However, when Cleon conducted a reconnaissance in force to Amphipolis with his entire army he apparently mishandled the withdrawal. Brasidas seized the opportunity to launch a sortie, catching the Athenians in mid-maneuver. The army collapsed and Cleon was killed—along with Brasidas. Brasidas' victory and the retention of Amphipolis gave Sparta the

ability to negotiate peace from a position of greater strength. Under the terms of the Peace of Nicias (421) Amphipolis was to be handed back to Athens, but the inhabitants refused to comply. Athens never regained control of the city or surrounding areas.

Andocides (ca. 440–ca. 391)

The aristocratic Athenian Andocides was an orator and politician. Three of his speeches survive (a fourth, *Against Alcibiades*, is almost certainly a forgery). In 415, Andocides and other young aristocrats were accused of mutilating the statues of Hermes the night before the Sicilian expedition sailed during the Second Peloponnesian War. The charges expanded to include profaning the Eleusinian Mysteries and the whole incident was seen as an attack on the democracy (which ultimately caused Alcibiades’ exile). Andocides confessed and informed on others (later claiming he did so to save his father). Some of these were executed, and although he survived, the decree of Isotimides effectively banned him from public life. Unpopular with the democrats for attacking the democracy, his peers saw him as a coward who had betrayed his friends; Andocides went into self-imposed exile.

In 410, his speech *On his Return* failed to get his rights restored and he only returned under the general amnesty at war's end (403). In 400/399, his *On the Mysteries* successfully prevented an attempt to reapply the decree of Isotimides. However, his career ended in 392/1 after his participation in an Athenian peace mission to Sparta. Despite his speech *On the Peace*, the Athenians rejected the terms negotiated. Andocides went into exile again to avoid a prosecution of the envoys and nothing more is heard of him. Andocides' career illustrates the underlying tensions between the democrats and upper classes in Athens exacerbated under wartime stresses.

Andrapodismos

Andrapodismos is a Greek word meaning “enslavement,” from the word *andrapoda*, “slaves” or “man-footed beasts” (formed on analogy with *tetrapoda*, “four-footed beasts”). In the context of war, it refers to the mass enslavement of captives or whole civilian populations, sometimes accompanied by the massacre of adult males. W. K. Pritchett lists some 140 cases where the sources mention such mass enslavements by Greek victors in the Archaic, Classical, and Hellenistic Periods. The purpose of such total destruction or dispersal of a population was chiefly the unambiguous display of power that it entailed.

Androtion (ca. 410–340)

Androtion, the Athenian historian, orator, and politician was from a prominent family (his father was probably a member of the Four Hundred, who seized power in 411) and a student of Isocrates. His history—an *Atthis* or narrative history of Athens down to 343—does not survive. It was used by Philochorus to construct his history of Athens and by the author of the *Athenian Constitution* ascribed to Aristotle. He may also be the same Androtion who wrote a book on agriculture.

Androtion was prominent in Athenian politics from around 386, taking an anti-Persian line and opposing Demosthenes' idea of an alliance with Persia against Philip II of Macedon. Demosthenes prosecuted him for an illegal proposal (354/3) and he was in exile in Megara from 350–340, writing his history.

Androtion's career is an interesting mix of intellectual endeavor and practical politics, unusual, but not unknown in Athens.

Animals in War

Animals served an important role in the armies of the ancient world, functioning as baggage and transport animals, as well as carrying soldiers

into combat. They were undoubtedly also used for food, particularly when an army found itself in dire straits.

Horses were the most important animal for combat itself, both in chariot forces and cavalry. Horses were not as useful off the battlefield when on campaign, as they were less suitable as baggage or transport animals. These tasks fell the other equids—donkeys and mules, who were more surefooted and sturdier than horses, and therefore capable of carrying and pulling heavier loads than a horse. Mules were held in great value by the Roman army, particularly the Reatine breed, which could command a very high price (Varro, *On Agriculture* 2.8, also Columella, *On Agriculture* 37.3–11). Mules are the result of breeding a horse and a donkey—usually an equine mare and a donkey stallion—and as such are sterile. On the rare occasion a fertile mule was born, it was held to be a powerful portent (Livy, *History of Rome* 37.3). On the one hand, this made keeping large numbers of mules together easier, as there was no issue with hormones. However, it also made the breeding process more expensive, as the studs housed their mules as well as horses and donkeys. The mules of antiquity were generally larger and more robust than their equine relatives, a mule foal generally growing to be 1–2 inches taller than its mother. Mules are extremely intelligent and have a reputation for being difficult to work with (Pliny recommends giving wine to a mule to stop kicking—*Natural History* 8.173) so the muleteer held a key place in managing baggage and transport trains within the army.

Elephants were also used in war (see illustration in Elephants entry), although their combat potential did not come to the attention of the Greeks until the fourth century and Alexander the Great's campaign in the east. These animals became especially important in the armies of the Hellenistic east. Hannibal brought his Carthaginian elephants to Europe during the Punic Wars, in one of the most famous instances involving that animal in war.

The camel—both the Bactrian and Dromedary—were also used in war. The Bactrian two humped variety was the original type, with the single humped Dromedary likely developing as a mutation as the camel moved further south into the hot, arid climate of the Near East and Arabia. The Bactrian is the shorter of the two varieties, with stockier legs and longer hair, but a considerably more massive body. The Dromedary is lighter in color with shorter hair, longer legs and a leaner body. Both breeds are capable of carrying heavy loads and going long periods without food or

water by using the fat stores built up in their hump. The Bactrian and Dromedary were used in the armies of the Arabian Peninsula and the Near East as baggage animals and in combat. Bactrian camels are portrayed as tribute given to the Persian king on the Apadana Staircase reliefs at Persepolis. Arabian camel cavalry mounted on Dromedaries are depicted in a series of reliefs from the Assyrian palace at Nineveh ca. 645.

Both camels and elephants offered a particular advantage to the armies of the eastern Mediterranean when they faced more traditional cavalry: camels and elephants are terrifying to horses who have never encountered them before. Cyrus' camels caused chaos among Croesus' Lydian cavalry (Herodotus 1.80.4); while Porus' elephants caused significant tactical issues for Alexander the Great before the battle at the Hydaspes (Arrian 5.10.2).

Antalcidas (d. ca. 367)

Antalcidas was a Spartiate sent in 392/1 during the Corinthian War as ambassador to Tiribazus, the supreme Persian satrap in Asia Minor. His mission was to make peace between Sparta and Persia because Conon's fleet was being used to further Athenian imperial interests. Antalcidas was prepared to concede Persian rule over the Greek cities of Asia Minor but the peace offer failed. However, Tiribazus did stop supporting Conon and privately supplied Antalcidas with money to support the Spartan fleet.

In 388/7, Antalcidas held the office of navarch and was able to negotiate peace and an alliance with Persia by conceding Persian rule over the Greek cities of Asia Minor. He commanded the naval operations blockading the Hellespont and forced Athens to admit defeat, ending the Corinthian War. The resulting treaty, often known as the Peace of Antalcidas as well as the King's Peace, guaranteed Sparta's Greek supremacy.

Antalcidas was ephor in 371/70 and as a guest and friend of Ariobarzanes, satrap of Phrygia, and King Artaxerxes II, had an unusual ability for a Spartiate to conduct diplomacy with Persia. He probably originated the policy he implemented to make Persia Sparta's ally and so is attested to have been a political enemy of Agesilaus; some modern researchers deny this. After Sparta's defeat at Leuctra in 371, when Boeotia successfully cultivated Persian support, Antalcidas failed to counter this on another mission to Persia and committed suicide.

Antigonus I Monophthalmus (382–301)

Antigonus Monophthalmus ("One-eye"), a Macedonian noble served under Alexander the Great and became one of the *diadochoi* (Successors) competing for supremacy after Alexander's death. During Alexander's invasion of Persia, as satrap of Phrygia from 333, Antigonus repelled several Persian attacks. In 323, the regent Perdiccas also allocated him Lycia and Pamphylia. Two years later, though, he fled when Perdiccas threatened him for not following orders. Antigonus played a major role in creating the wars that followed when he persuaded Antipater and Cassander that Perdiccas was plotting against them too. The following year (320) Antipater appointed Antigonus to command against Eumenes of Cardia in Asia Minor. In 319, Antigonus overran Eumenes' territory, besieged him in Nora, and defeated a relief force. On Antipater's death (also 319), Antigonus allied with

Cassander, Lysimachus, and Ptolemy I Soter to fight Polyperchon, Antipater's successor. His immediate task was to defeat Eumenes, now Polyperchon's commander in Asia Minor. Antigonus fought two indecisive battles against Eumenes—Paraetacene (317) and Gabiene (316), but at the latter Eumenes was betrayed to him and executed.

Antigonus seized the treasury at Susa and occupied Babylon—its satrap, Seleucus, fled to join Ptolemy in Egypt. Antigonus' success in securing most of Alexander's Asian possessions led the other *diadochoi* (Cassander, Lysimachus, Ptolemy, and Seleucus) to join forces against him. Despite this, Antigonus enjoyed several years of success against them. He sent money to Polyperchon to allow him to fight Cassander and secured local support in Asia Minor and the Aegean, respectively, by declaring all Greek cities free and establishing the "League of Islanders." This League was a maritime league, which had the additional benefit of remedying his weakness in naval power. Antigonus also conducted successful campaigns in Phoenicia and Syria. However, in 312 Antigonus' son, Demetrius (later Demetrius I Poliorcetes) was defeated by Ptolemy at the battle of Gaza.

This defeat led to peace with Cassander, Lysimachus, and Ptolemy (311) but also allowed Seleucus to regain his satrapy and rebuild his power base. Seleucus not only held out but decisively defeated Antigonus' forces at an unknown location (309). Antigonus turned his attention west, to the Aegean Sea and mainland Greece, leading to a long-running naval conflict with Ptolemy. In 307, Demetrius liberated Athens, and in 306 Antigonus defeated Ptolemy's navy off Cyprus and seized the island. Antigonus then proclaimed himself and Demetrius as kings—the other *diadochoi* soon followed suit.

However, Demetrius famously failed to take Rhodes and in 304 had to return to Greece to prevent Cassander from occupying Athens. Building on this successful operation, in 302 Antigonus reestablished the Hellenic League of Philip II and came close to defeating Cassander. Once again, Antigonus' success caused Cassander, Lysimachus, Ptolemy, and Seleucus to band together. In 301, the 80-year old and very overweight Antigonus was killed at the battle of Ipsus, left in the lurch when Demetrius' over-eager cavalry pursuit took him too far from the battlefield.

Antigonus II Gonatas (ca. 320–239)

Antigonus II Gonatas was king of Macedon from 276 to 239. He was the son of Demetrius I Poliorcetes who was king until Pyrrhus and Lysimachus deposed him in 288. Demetrius died in Asia in 283, from which date Antigonus formally dated his reign. However, Antigonus was not able to enter Macedonia and begin effective rule until 276 and then suffered an immediate invasion by the combined forces of Pyrrhus and Lysimachus, which was eventually repelled. There were no subsequent threats to his long reign.

As with other Hellenistic kings, there were various marriage alliances, and Antigonus was related to several of the Seleucids and Ptolemies. All of the kings in the third century knew each other, and quite well. The first generation were men from the army of Alexander the Great, the next generation (including Gonatas) were their sons, who had grown up often enough in army camps and garrisoned cities.

The youth of Antigonus was spent primarily in Athens, where he was a student of Zeno the Stoic. The two men remained close friends for the rest of their lives. Although Antigonus was philosophically schooled, it would not be accurate to call him any kind of a “philosopher king.” He was apparently a very practical, hardheaded realist, capable of doing whatever needed to be done to maintain himself and his kingdom safely.

He arranged very early to exert a strong control over the nominally independent Greek cities to his south. At one time or another, he placed

garrisons within cities; in other cases he managed control by supporting (often financially) friendly politicians. He passed this control on to his successors.

His relationship with the other great powers differed. He was bound to the Seleucids by marriage alliances, although that may not fully account for the long-term friendly relationship. There was never any real hostility between them. It was a different story with the Ptolemies of Egypt. The hostility was constant, in part perhaps because both had large navies and sought sea control in the Aegean and adjacent areas (the Seleucids did not). There are at least two known great naval battles between Ptolemy and Antigonus, but neither can be dated with any certainty and even the context is unclear. Antigonus won the battle of Cos, and it is not clear who won the battle of Andros (probably Antigonus).

Ptolemy II was clearly behind the Chremonidean War (267/6–263/2), in which Chremonides, a prominent Athenian who may already have had connections with Egypt, persuaded his city to start a war with Macedonia. There were no major battles; Antigonus immediately brought the city under siege and Athens eventually surrendered. A Macedonian garrison was placed within the city and stayed for five years. There was no formal abrogation of the democracy, but Antigonus controlled all elections and officials. Athens presented no problem for the rest of his reign and beyond.

Antigonus III Doson (ca. 263–221)

Born around 263, Antigonus III Doson was the son of Demetrius the Fair, half-brother of Antigonus II Gonatas, and paternal grandson of Demetrius I Poliorcetes. When his nephew Demetrius II of Macedon died in 229, Doson became guardian and regent for Demetrius' son, the future Philip V of Macedon.

Antigonus Doson defeated and repelled the Dardanian invaders who had defeated and killed his nephew, put down a Thessalian rebellion, and regained control of the region. In 227, he assumed the title of king. Choosing to exert Macedonian domination through diplomacy rather than military might, Doson formed alliances with Epirus and the Achaean League. The threat of Cleomenes III and a resurgent Sparta, supported by Ptolemy III Euergetes, led to Aratus of Sicyon, who had previously long been an opponent of Macedon, inviting Antigonus to intervene against Sparta in 226. To ensure Antigonus' support against Cleomenes, Aratus handed him control of the Acrocorinth, one of the strategic "Fetters of Greece."

In 224, Antigonus took possession of the Acrocorinth, stopping only long enough to install a garrison prior to pressing quickly on to Argos and then Arcadia, ejecting Cleomenes' garrisons in these areas as he did so. He then made his way to Aegium to meet with the Achaean League and, just before the allied army went into winter quarters, was appointed commander-in-chief of the forces opposing Cleomenes.

The following spring, in 223, Antigonus took Tegea after a short siege, and then marched on Laconia. He had to change plans, however, when news came that Arcadian Orchomenus had sided with Cleomenes. He stormed Orchomenus and then besieged Mantinea, which quickly surrendered, as did Heraea and Telphusa. With winter approaching, he kept his mercenaries but sent his other troops home to Macedon, while he attended another meeting with the Achaean League at Aegium. Seizing his chance, Cleomenes took Megalopolis, so Antigonus had to winter in Argos. At the battle of Sellasia in 222, Antigonus' victory over Cleomenes was so decisive that Cleomenes escaped with nothing more than a few close companions and fled to Egypt. Antigonus spared Sparta, claiming that Cleomenes himself was the enemy and not the city of Sparta.

During Antigonus' campaign in the Peloponnese the Illyrians had invaded Macedonia, and Antigonus now hurried north to meet them; as he passed through Tegea and Argos he stopped to attend the Nemean Games, where he was honored by the Achaean League, among others. Upon

reaching Macedonia he defeated the Illyrian invaders, but during the battle became sick and died shortly afterward, leaving the Macedonian throne to Philip V.

Antiochus I Soter (ca. 324–261)

Antiochus I Soter was a king of the Hellenistic Seleucid Empire. He reigned from 292 to 261 (as co-regent until 281). Antiochus I was the son of King Seleucus I Nicator and the Sogdian princess Apama. Soon after Seleucus' assassination in 281, Antiochus had to restore his father's empire by force of arms because of revolts in Syria and northern Anatolia, and a war led by Antigonus II Gonatas of Macedon. In addition, some 20,000 Galatians entered Asia Minor in 278, creating havoc. The victory Antiochus won over them three years later, with the systematic use of war elephants (see illustration in Elephants entry), led to his title of Soter ("savior"). Antiochus also founded many new cities in Asia Minor and modern-day Iran, while at Babylon he rebuilt the ancient Esagila shrine.

At the end of 275, the continuous friction between the Seleucids and the Ptolemies over the regions of Coele-Syria and Phoenicia, led to full-scale war (known as the First Syrian War). The war did not change the borders of the two kingdoms dramatically, and Coele-Syria and Phoenicia remained under Ptolemaic rule. Around 262, Antiochus tried to put an end to the growing power of Eumenes I of Pergamum by military force, but he was defeated near the city of Sardis and died soon afterward. Antiochus was succeeded in 261 by his second son, Antiochus II Theos.

Antiochus III (the Great) (d. 187)

Antiochus III Megas (“the Great”) ruled the Seleucid kingdom between 223 and 187. Antiochus succeeded to the throne at the age of 20, after the death of his elder brother, the previous king, Seleucus III. He put his cousin Achaeus in charge of Asia Minor west of the Taurus Mountains, with the specific task of reconquering Seleucid lands seized by Attalus I, founder of the breakaway kingdom of Pergamum. Falsely accused by Antiochus’ minister Hermeias of planning a rebellion, Achaeus had himself made king in 221/20. At this time, Antiochus was busy putting down the rebellion of Molon, the Seleucid satrap of Media and governor-general of the Upper Satrapies. Between 219 and 217, Antiochus fought the Fourth Syrian War against Ptolemy IV over Coele-Syria. He succeeded in conquering Tyre and Seleucia Pieria, among other places, but these acquisitions were lost when he was defeated at the battle of Raphia in 217. Antiochus then turned to Achaeus and the war in Asia Minor. With the help of Attalus, he reconquered the Seleucid domains west of the Taurus, and captured and executed Achaeus in 213.

Silver tetradrachm of Antiochus III (the Great), minted at Antioch, 222–210. Antiochus' attempts to expand the Seleucid Empire were relatively successful until he clashed with Rome. Defeated in the Syrian-Roman War (192–188), Antiochus was forced to surrender Asia Minor west of the Taurus Mountains, all his war elephants, and most of his navy. (Yale University Art Gallery)

In 212, Antiochus began his *anabasis*, a massive military expedition across his eastern empire to recover areas lost during the Seleucid civil wars of 245–225. He brought Parthia and its king, Arsaces II, to heel. He next attacked the rebellious kingdom of Bactria, under the rule of Euthydemus I. Antiochus defeated Euthydemus in the battle of Arius in 209, but was forced to make peace with him after the unsuccessful siege of the Bactrian capital, Bactra. Antiochus then pressed on into Afghanistan and India, crossing the Hindu Kush and renewing his friendship with Sophagasen (Subhashsena) before returning west. It was probably during his *anabasis*, which

resembled that of Alexander the Great, that Antiochus began styling himself “The Great,” in conscious imitation of Alexander.

After his return to the west, Antiochus resumed hostilities with the Ptolemaic kingdom over Coele-Syria. The throne was now occupied by “a helpless infant,” the five-year-old Ptolemy V Epiphanes, and Polybius records the striking of a secret pact by Antiochus and Philip V of Macedon in winter 203/2 to attack and dismember the Ptolemaic kingdom. The Fifth Syrian War (202–195) saw Antiochus recover Coele-Syria from Ptolemy and a major Seleucid victory at the battle of Panium (200).

Beginning in 196, Antiochus began consolidating what he regarded as ancestral Seleucid territory in Asia Minor, attacking various Greek cities and Rhodian and Pergamene territory, and crossing the Hellespont into European Thrace. Antiochus’ relentless aggression, especially against Rome’s eastern friends, and his formidable reputation as a “new Alexander” drew the attention of the Romans, beginning in the late 200s. The Republic established friendship with him in 200 during a failed Roman attempt to mediate the Fifth Syrian War. In 198, the Romans successfully intervened in the conflict between Antiochus and Attalus of Pergamum. After the Roman victory over Philip V in the Second Macedonian War, the Romans warned Antiochus not to harm the autonomous Greek cities of Asia Minor, and to evacuate the former possessions of Ptolemy and Philip there. At a conference at Lysimacheia in September 196, Antiochus effectively outmaneuvered the Romans, responding to their complaints point for point. Now firmly established in Thrace and Coele-Syria, Antiochus requested a treaty of alliance with Rome to clarify his status and authority relative to Rome’s in the east. The Romans refused and demanded that the king abandon Thrace. Antiochus simply ignored the ultimatum.

In 192, the Aetolians, disgruntled by Roman treatment of them in the settlement of the Second Macedonian War, made Antiochus *strategos* of their League, and the king crossed to Greece in 192. The Syrian-Roman War (192–188) broke out when Antiochus’ soldiers attacked some Roman soldiers at Delium. The Romans defeated Antiochus twice in battle, at Thermopylae (191) and Magnesia in Asia Minor (190/89). The subsequent Peace of Apamea (188) compelled Antiochus to give up all his territory west and north of the Taurus. Antiochus was killed in 187 while plundering the Temple of Baal at Susa.

Antiochus IV Epiphanes (ca. 215–164)

Antiochus IV Epiphanes was king of the Hellenistic Seleucid Empire from 175 to 164. He was the son of Antiochus III and Laodice III. After his father's defeat by the Romans in 189, Antiochus was sent to Rome as a political hostage. He remained there until 175, when his brother Seleucus III managed to release him. Soon afterward, Seleucus was assassinated, and Antiochus claimed the throne.

In 170, the Ptolemies demanded the return of Coele Syria, Palestine, and Phoenicia, which had been recently conquered by the Seleucids. Antiochus responded swiftly and with a preemptive attack took control of Egypt and Cyprus (the Sixth Syrian-Egyptian War). Because of Roman intervention, however, Antiochus was unable to keep those newly gained territories.

On his way back from Egypt (167), Antiochus sacked the city of Jerusalem. The Jewish religion was outlawed and Antiochus enforced the establishment of an imperial cult; a statue of him portrayed as Zeus was erected in the Jewish temple. This move, in connection to a general effort for the Hellenization of the Jews, eventually led to the Maccabean Revolt.

Antiochus returned in triumph to Antioch (166) but soon had to turn his

attention to more serious problems on his eastern borders, where he was forced to face the Armenians and the Parthians. Antiochus fell ill and died in 164 while in Persia.

Antiochus VII Sidetes (b. ca. 159; Reigned 139–129)

Antiochus VII Sidetes was the last Seleucid king who might have held the empire together. When his older brother Demetrius II was captured in Parthia in 139, Antiochus occupied the northern part of the empire with a mercenary army and was then invited into the capital Antioch by Demetrius II's wife Cleopatra. He then married her and took the title King Antiochus Euergetes ("Benefactor"). However, he was more commonly known by the nickname "Sidetes" ("the Sidonian") from his early life in Side in southern Asia Minor.

Antiochus vigorously suppressed the usurper Diodotus Tryphon who had been in control of the southern parts of the empire since Demetrius II's reign. He also reasserted Seleucid control over Judea-Palestine (135–134). With the western empire restored to its full extent, in 129 Antiochus launched an ambitious campaign to win back territory in present-day Iraq and Iran that had been lost to Parthia. He won several victories across these regions but could not bring the Parthian king to accept subjection to Seleucid rule. His army, wintering in scattered camps, was surprised by local uprisings. The main Parthian force shattered Antiochus' army near Ecbatana. He was killed and most of his army taken prisoner.

This disaster, and the loss of manpower, made permanent the loss of the eastern territories. The Seleucid realm was now confined to Syria and the immediately adjacent territories.

Antiochus Hierax (ca. 260–226)

Antiochus Hierax (“The Hawk”) was the younger brother of King Seleucus II (reigned 246–225). Placed in charge of Seleucid territory in Asia Minor with the backing of his mother Laodice, the late king’s widow, he acted as a virtually independent ruler, supplying reinforcements in the Third Syrian War (246–241) only on condition of being recognized by his brother as joint king.

When Seleucus II moved against Hierax in the “War of the Brothers” (237–236), he defeated him in two battles but failed to capture Sardis, where Hierax had taken refuge. Hierax then made alliances with the Seleucids’ enemies in Asia Minor: Ziaelas of Bithynia, Mithridates II of Pontus, and the Galatians. This coalition defeated Seleucus II heavily at Ancyra and forced him to make peace.

Hierax had to pay indemnities to the Galatians and even so could not prevent them from plundering his territory. King Attalus I of Pergamum undertook a defensive war against the Galatians and building on his successes drove a discredited Hierax out of Asia Minor. Hierax fled to King Arsames of Armenia and induced him to provide forces for an attack on his brother. Hierax was defeated by a Seleucid reserve army in Mesopotamia, commanded by Seleucus II’s uncle Andromachus and his cousin Achaeus. Seleucus II himself was forced to break off his campaign against the Parthians and drove Hierax out of Asia Minor, where he had attempted to reestablish himself, into Thrace. There he was murdered by some Galatians.

Hierax’s turbulent career illustrates how tenuous the Seleucids’ hold on

Asia Minor was and how prone the Seleucid family was to internal conflict.

Antipater (399/8–319)

Antipater was Alexander's regent in Macedon during the king's conquest of Asia. He suppressed two significant uprisings against Macedonian hegemony. The first was led by the Spartan king Agis III in 331, and the second—a largely Athenian revolt under Leosthenes—occurred after Alexander's death in 323. Plutarch records the rumor that Antipater and his son Iollas were part of a plot to poison Alexander in 323.

Born in 399/8, Antipater had a long history of military and political service to Macedon, and his role at court probably extended back to the time of Perdiccas III. He may have participated in the Illyrian campaign of Perdiccas, and, according to the *Suda*, composed a history of the campaign. He is also thought to have written a collection of letters in two books. A number of letters of Antipater are cited by Cicero and Plutarch. Antipater had been a friend of Aristotle and probably a follower of the Aristotelian school of philosophy, as the *Suda* also reports. Aristotle resided at the Macedonian court in the reign of Philip II, so it is possible that Antipater forged his friendship with the philosopher during this period. Later writers quote Aristotle's correspondence with Antipater, and Aristotle appointed Antipater the executor of his will. Antipater may well have supported the emerging Lyceum as a school for Aristotelian philosophy.

Antipater, along with Parmenion, played a significant role in negotiating the peace settlement (Peace of Philocrates) between Athens and Macedonia in 346. In 342, Antipater assumed the first of what would be several roles acting as a royal representative in various capacities. He represented Philip

at the Pythian games as a religious state ambassador (*theoros*), and was appointed as regent of Macedonia before Alexander's coming of age.

While Antipater served Philip as a general and foreign diplomat, helping the often undiplomatic Philip deal with especially subtle Greek affairs, it was after Philip's assassination that he revealed his keen political insight and judgment. In the chaotic aftermath of Philip's murder, Alexander's accession owed much of its success to Antipater's early support, and this support was rewarded with increased influence in the court.

During the Lamian War Antipater defeated the Athenians at the battle of Crannon in September 323, then suspended the Athenian democracy and was responsible for the death of Demosthenes. After the Triparadisus settlement in 321, he retained control over Greece and Alexander's son (Alexander IV). At his death in 319, following an illness, Antipater left his kingdom to Polyperchon, rather than his own son Cassander.

Antiphon (ca. 480–410)

Antiphon was an Athenian aristocrat, orator and oligarchic politician. Six of his speeches, representing very early examples of Attic oratory, survive. Antiphon disliked the democracy and rarely if ever spoke in public—his speeches were written for others. In 411, Antiphon emerged from the shadows as a leader of the oligarchs known as the Four Hundred, who overthrew the democracy. Antiphon was regarded as the intellectual force

behind the group and led the ideologically extreme faction against Theramenes and the moderates.

When the Four Hundred were overthrown (410) Antiphon was one of its few members who remained at Athens. He was tried and, despite Thucydides' assessment (8.68) that "he made the best defense speech of all up to that time," was executed.

Antiphon's career illustrates the underlying resistance of some members of the upper classes to the democracy. Although generally buried below the surface (the upper classes profited from the empire) they did emerge under the stresses of the latter stages of the Second Peloponnesian War (431–404).

Aornus, Siege of (327/6)

Aornus, sometimes called Aornis, was besieged and captured in winter 327/6, in the early stages of Alexander the Great's Indian campaign. Aornus was one of the last of Alexander's major sieges and Alexander is supposed to have been driven to take this seemingly impregnable fort on top of a mountain spur because his ancestor Hercules had failed to take it. However, the site also threatened his long supply line back over the Hindu Kush. Using local guides to find the best approach, Alexander secured a hilltop on it, built a mound to engage the defenders with archers and siege engines and built a ramp to the site. Although his initial assault was repulsed, his tenacity in continuing terrified the defenders and they negotiated a truce on the pretense of surrendering but intending to withdraw that night. Alexander anticipated this and ambushed the retreating enemy, causing

major casualties.

Apamea, Peace of. See Syrian-Roman War (192–188)

Appian of Alexandria (ca. 95–165 CE)

Appian wrote a series of historical works dealing thematically with the various wars of the Roman state down to the early first century CE. The parts of his surviving work that are relevant to Greek history are from his Roman History: Book 9 *Macedonica* (fragmentary), Book 11 *Syriaca* (on the Seleucids) and Book 12 *Mithridatica* (on Rome's wars with Mithridates of Pontus). These are sometimes referred to as if they are discrete works under the titles: *Macedonian Wars*, *Syrian Wars*, and *Mithridatic Wars*. Appian was at his best a reasonably competent historian but his chosen method led at times to error and excessive compression.

Aratus of Sicyon (271–213)

Aratus was an Achaean League political and military commander, instrumental in uniting much of the Peloponnese against Macedon, and then against Sparta and the Aetolian league. When his father, Cleineas, was assassinated (ca. 264) Aratus was exiled and completed his education in Argos. Returning in 251, aged 20, Aratus expelled the tyrant Nicocles. He soon brought Sicyon into the Achaean League, an innovative policy both for Sicyon and the League, and from 245, at the very young age of 26, he was usually elected general (*strategos*) of the Achaean League every second year. Incumbents could not hold the post two years in a row, so continued reelection (he held office 17 times) was the closest to permanent tenure possible.

Aratus' ancient reputation was of a man lacking physical bravery and with mixed ability as a general. Polybius (4.8) describes him as preeminent in military enterprises involving building alliances, stratagems, intrigue, and surprise attacks but because he lacked personal valor and was slow and timid in action in normal campaigning: "the Peloponnese was filled with trophies that marked his defeats." If accurate, Polybius' account (4.9.14) of the battle of Caphyae (220, against the Aetolians, in Elis)—the only extant detailed account of one of Aratus' set-piece battles—suggests Aratus had limitations in the field. On this occasion, he dismissed most of his army before the enemy intentions were clear and then precipitated a battle on terrain favoring the Aetolians.

However, Aratus' reputation was vigorously attacked by his contemporary enemies and the surviving records may reflect this; Plutarch (*Aratus* 29) describes the criticisms as arising from "flatterers of tyrants." If he had been as consistently flawed as suggested, his regular reelection as Achaean League *strategos* seems strange.

Overall, his career was successful. His initial policy was to expel tyrants from Peloponnesian cities and unite the area against external interference—principally Macedonian. This involved a mixture of diplomacy and military action. In 243, he seized the Acrocorinth from Macedon by a brilliant surprise night attack, bringing Corinth into the Achaean League. This was an important move, allowing the League to interfere with the movement of troops into the Peloponnese by land. In 239, Aratus organized an anti-Macedonian alliance with the Aetolian League and over the next 10 years

brought in other major cities, including Megalopolis (235) and Argos (229). However, this increase in the Achaean League's power and influence triggered local opposition. In 228, Cleomenes III of Sparta and the Aetolian League joined forces, triggering the so-called Cleomenic War with the Achaean League.

Aratus obtained approval from the League for Megalopolis to appeal for assistance to their old foe, Macedon. After a series of military reverses—Lycaenum and Ladochea (227), and Hecatombeum (226)—and losses, including Argos, Phlius, and Corinth (225), the League activated the agreement in 224, surrendering the Acrocorinth to Macedon. At the time, Sicyon was under siege. Antigonos III Doson responded by invading the Peloponnese, aided by the Achaean retrieval of Argos. Cleomenes' defeat at Sellasia in 222 ended the war. Aratus and the League later transferred their allegiance to Antigonos' successor, Philip V. In 220, Aratus called upon the Hellenic League set up by Doson to assist against Aetolian aggression and with Philip's help successfully ended the Social War (220–217). However, Aratus later disagreed with Philip over his attempts to dominate the Peloponnese and his anti-Roman policy. Aratus died in 213 and while the recorded symptoms suggest tuberculosis, the belief at the time was that he had been poisoned by Philip V. It is unfortunate that Aratus' own history of the Achaean League (*Hypomnēumata*, usually called "Memoirs") does not survive, although Polybius based his account of the Cleomenic War on it, preferring it to the rival account of Phylarchus.

Greeks were well used to using arbitration to settle disputes. In Athens, where we know the system best, there were public arbitrators, citizens all in their sixtieth year, who adjudicated on small disputes. This was an alternative to taking matters to a full-scale trial, where the disputants had to speak before a jury often of 501 citizens. It is very likely that the great majority of disputes were settled by arbitration, though a person unhappy with the arbitrator's verdict could still resort to a jury trial. An arbitrator would try to decide a case in terms of equity, rather than by strict adherence to law. To some extent the jury-courts were similar, since there were no lawyers *per se*, the presiding magistrate had no role in advising the jurors on the law, and jurors were free to cast a secret vote according to their own sense of the justice of the case.

Similarly, states might try to resolve their disputes through arbitration, perhaps in order to avoid the heavy costs of war, but perhaps also to arrive at an equitable outcome rather than simply letting the stronger state prevail. The majority of cases are known from inscriptions, but some also from historical texts. Herodotus describes the earliest case of which we know, when sometime around 600 the Corinthian tyrant Periander arbitrated a dispute between Athens and Mytilene over possession of Sigeum in the Troad. He decided that each city should retain the territory they controlled at the time of the arbitration, thus giving Sigeum itself to the Athenians. According to Plutarch, when Athens and Megara were fighting for control of the island of Salamis in the same period, they had the case heard by a group of five Spartan arbitrators. Plutarch's account envisages a situation where each side could make their case before the arbitrators, and quotes versions of the story in which the Athenian Solon either invented lines of Homer to suit the Athenian cause, brought up mythical genealogies, discussed the way the early inhabitants of Salamis buried their dead, or cited an alleged pronouncement by the Delphic oracle. The evidence for this case is not reliable, but Solon's arguments may well reflect some types of "evidence" that might be used in real arbitrations.

Arbitrators might be men from powerful states, such as in the examples above, perhaps because they had power to enforce judgments (in 421, Sparta garrisoned the Elean town of Lepreum after the Eleans refused arbitration in a dispute over Lepreum's independence), but perhaps more often because of their prestige. Even higher powers could be invoked: when the Corcyraeans were in dispute with Corinth over their colony Epidamnus in the late 430s,

they suggested arbitration either by mutually acceptable Peloponnesian cities or by the Delphic oracle. Neutrality was, of course, important. It has been suggested that Pausanias' generally unlikely claim that in the early sixth century 16 women of Elis arbitrated a dispute between Elis and Pisa may make sense on the basis that, being women, they were not technically citizens of either state.

Treaties might often make provision for future use of arbitration in cases of dispute, sometimes at the behest of more powerful states. Thus, for example, at the end of the Ionian Revolt the Persian satrap Artaphrenes summoned representatives of the Ionian cities to Sardis and instructed them to make treaties with each other that they would not ravage each other's territory but would submit disputes to arbitration. In both their one-year truce in 423 and in the Peace of Nicias in 421, Athens and Sparta resolved to settle any disputes not through force of arms but through *dike*, here "lawsuit" or "trial" (in 423) or trials and oaths (421). Taking a matter to arbitration could, where it was possible, be invoked as a moral duty. Thucydides has the Spartan king Archidamus, a speaker of whom he generally approves, say (speaking about the dispute over Potidaea) that in a case like this, where the other side has offered arbitration, it was positively unlawful not to take up the offer. Later, Thucydides tells us that in 413 the Spartans felt that their failures in the first half of the war had perhaps been justified punishment for their refusal to go to arbitration in 431, despite the provisions of the Thirty Years Peace of 445.

Many inscriptions attest to the continued use of arbitration in the fourth century and the Hellenistic Period. Around 450, Argos adjudicated on a dispute between two Cretan cities, possibly on the basis that some Cretan cities were believed to be Argive colonies. In the Hellenistic Period, Antigonos I Monophthalmus had Mytilene arbitrate disputes between the small states of Teos and Lebedus, while an inscription from Priene indicates that a dispute with Samos was successively arbitrated (without much success, it seems) by Alexander the Great, Antigonos I Monophthalmus, Lysimachus, Antiochus (probably III), Philip V of Macedon, and the Rhodians. Finally, the Romans settled the matter. Indeed, the Romans were no strangers to the practice of arbitration. For example, at the start of the Second Macedonian War in 200 they demanded that Philip V have his disputes with Rhodes and Attalus settled by arbitration. Philip refused, and war proceeded; no doubt this happened quite often.

Arcadia, Arcadians

Arcadia is a mountainous region in the central Peloponnese. From the Archaic down to the Hellenistic Periods, Arcadia was composed of numerous separate communities. The major Arcadian *poleis* were Mantinea, Tegea, Orchomenus, and, from 371, the *polis* of Megalopolis. However, by the sixth century, a sentiment of common regional identity was apparent in the various fragmented communities of Arcadia.

In the mid-sixth century, after a long war (ca. 580–550), the Spartans were able to force an unequal alliance on Tegea, the chief *polis* of Arcadia. The Tegeans were not enslaved like the Spartan Helots, but they were required to pay a monetary tribute to Sparta and their administrative system came under Spartan political control. The Spartans followed the same domineering policy with other Arcadian *poleis*, which like Tegea were forced to join the Peloponnesian League.

Sometime in the fifth century, when Sparta's control in the Peloponnese had weakened, Tegea allied with Argos against the Spartans. In the aftermath of the Persian Wars, after the battles of Tegea (473) and Dipaea

(471), the Spartans forcefully defeated the Tegeans, Argives, and the combined forces of the First Arcadian League. Afterward, despite their huge losses and fragile position, the Spartans compelled the Arcadians to rejoin the Peloponnesian League. From that time the Arcadians remained subject allies of the Spartans, except for a brief rebellion during the Second Peloponnesian War: this ended with the battle of Mantinea in 418.

After the defeat of the Spartans by the Theban Epaminondas at Leuctra in 371, the alliance between Sparta and Arcadia was permanently broken. In 371, after the foundation of Megalopolis, the “great city,” Arcadia achieved its first political independence. In the same year, under Theban guidance, the Second Arcadian League was formed and played a major role in overthrowing Spartan hegemony over Arcadia.

Later, in 234, Arcadia joined the Achaean League, which eventually became subject to the Romans. In 168, after the defeat of the Macedonians at the battle of Pydna, the Romans took 1,000 upper-class Achaeans as hostages, and transferred them to Italy; one of them was the historian Polybius. In 146, after the destruction of Corinth, Arcadian liberty came to an end.

Arcadian League

By the late 470s, it is clearly evident that Arcadia was anti-Spartan. Fifth-century silver Arcadian coinage bearing the word *Arkadikon* (in full or abbreviated form) is considered as solid evidence for the existence of the First Arcadian Confederacy or League by the late 490s. The architect behind the formation of this league was Cleomenes I, the fugitive king of Sparta who had been exiled after allegedly bribing the Delphic Oracle. Many *poleis* and tribes (Cynurians, Parrhasii, Mainalians) composed the Arcadian *ethnos* (tribe) during the fifth century, but Arcadia did not form a clear political unit. The precise functions of the fifth century First Arcadian League are not clear.

After the defeat of the Spartans at the battle of Leuctra in 371, Lycomedes of Mantinea with the help of Tegea organized the unification of many anti-Spartan, democratic Arcadian *poleis* into one federal state. By late 370 or early 369, most of the Arcadian cities had joined this Second Arcadian League. The capital of the League was Megalopolis, a synoecism composed by the unification of many small groups in southern Arcadia. Their ambitious strategy was to regain lost territory and overthrow the hegemonic leadership of Sparta and in the early years of its operation it was successful. The League had a large primary assembly, known as the Ten Thousand, a council composed of varying numbers of representatives of the various cities, proportional to their size, and a standing army, the *eparitoi* contributed by the member states. The most important magistrate was a powerful *strategos* (general).

The democratically inclined League, with help from its Athenian allies, soon became involved in war in and with Elis. However, by the late 360s, relations with Thebes led to internal conflict, especially between Mantinea and Tegea, which weakened the League and led to the battle of Mantinea in 362, where member cities fought against each other. After Mantinea, discord between members and especially among the federal forces, the *eparitoi*, crippled the League. By the time of Alexander the Great, the Second Arcadian League had apparently disappeared. By the late third century the Arcadian *poleis* had joined the Achaean League.

Archelaus (d. 399)

Archelaus I, the son of Perdiccas II, succeeded his father as king of Macedon and ruled from 413 to 399. This was a period of territorial consolidation for the Macedonian kingdom. He was a beneficent king, known for his philhellenic rule and in-depth strategies in state and military administration. Xenophon mentions that Archelaus contributed financially to the rebuilding of the Athenian naval fleet after its destruction at Syracuse. As a way of thanking him for his financial assistance, in 406, the Athenians publicly honored Archelaus as ambassador and benefactor. Thucydides also praises Archelaus for his military initiatives and commercial reforms, which aimed to strengthen the economy and military defense of his kingdom. This included road-building, reorganizing the Macedonian cavalry arm, and improving the arms and equipment of the infantry. In 400, Archelaus transferred the capital of his kingdom from Aegae to Pella, where both Philip II and Alexander the Great were later born. In 399, Archelaus was assassinated by his lover Craterus, although an alternative version recorded in Diodorus Siculus states he died by accident during a hunt. By the time of his death, Macedon was transformed into a strong military kingdom.

Archers (*Toxotai*)

Archers appear in Homer where they are frequently described as shooting from the protection of shield-bearing troops. This style of fighting is shown on Geometric and Archaic Greek pottery. These representations date to times before the formation of the Classical Greek *polis*, when individual warriors were entirely responsible for their own equipment and training, unregulated by the state.

The only area in Greece where the young men were systematically trained to fight as archers was Crete, and Cretan archers were employed as mercenaries by other Greek states from the earliest times. Other Greek states had to employ mercenaries, from Crete or further afield, or to pay their own citizens to train “to shoot in the bow.”

Attic vases dating to the times of the tyrant Peisistratus show Scythian mercenary archers operating from behind the shields of (Athenian?) hoplites in this way. Both the tyrants Polycrates of Samos and Gelon of Syracuse are known to have retained forces of archers, 1,000 and 2,000, respectively, but it is not known in either case whether they were foreign mercenaries or native troops retained by the tyrants and trained as archers.

Other states, such as democratic Athens, had to vote the funds to pay their own citizens a subsidy to compensate them for their time spent in training. Athens is not mentioned as fielding a force of archers at Marathon,

but they are present at Salamis, where every trireme had its complement of four archers, and present at Plataea. On the eve of the Peloponnesian War (431–404) Athens had 200 horse-archers and 1,600 foot-archers. The Athenians took 480 archers with them to Sicily, 80 of them Cretans.

Their Lacedaemonian adversaries did not have the funds to pay for a force of archers on a regular basis. The archers raised in 424 were probably Cretan mercenaries, and Cretan archers, probably recruited from Knossos and west Cretan states allied to Lacedaemon, are mentioned as fighting in Lacedaemonian armies throughout the first half of the fourth century, like the 300 Cretan archers who fought at Nemea in 394. The 200 Cretan archers who are mentioned as taking part in the *Anabasis* recorded by Xenophon were probably recruited through Lacedaemonian agency.

Scythian archer in a hunting scene from the “François Vase,” ca. 570, from Fonte Rotella, Chiusi, Italy. Archers were generally regarded as inferior to hoplites (heavy

infantry) but could play a useful role in battle. Although archers were available in Greece, especially from Crete, Scythian mercenary archers were particularly highly regarded. Located in the Archaeological Museum, Florence, Italy. (Gianni Dagli Orti/ The Art Archive at Art Resource, NY)

One incident during the *Anabasis* helps to explain the popularity of Cretan mercenary archers. In forming a false ambush against the Drilae, the bronze *peltae* (shields) held by the Cretan archers “would now and then gleam through the bushes,” deterring the Drilae from advancing (Xenophon, *Anabasis* 5.2.28-32). It was the additional ability of Cretan archers to fight at close quarters, thanks to their bronze peltae that made them much sought after. Almost all the armies of the Hellenistic kings included regiments of Cretans, which were raised in two different ways. “Retained regiments” were recruited and paid directly by the king on an individual basis. “Symmachic contingents” were forces that individual Cretan city-states agreed to send to the king in time of war according to an alliance (*symmachia*) contracted between the two.

The Macedonian army under Philip and Alexander had both a regiment of Macedonian archers (commanded by one Briso) as well as a regiment of Cretan mercenaries, who presumably initially trained the Macedonians.

The Asian conquests of Alexander made available further pools of manpower trained to fight as archers, and at his death Alexander was preparing a plan to form a mixed fighting formation consisting of Macedonian pikemen and Persian missile troops. It was from the Persians that combined units of archers and slingers were principally recruited during the age of the *diadochoi*, and thereafter it was the Seleucids who inherited the Asian recruiting areas for archers.

Archers and slingers (probably Persians) are mentioned in the forces commanded by the rebel satrap Molon. The forces commanded by Antiochus at Raphia included 2,000 Agrianian and Persian archers and slingers, as well as 1,500 Cretans under Eurylochos and 1,000 Neocretans under Zelys of Gortyn. The forces on the Ptolemaic side included Cretans as well, commanded by Cnopias of Allaria, 1,000 being Neocretans under Philo of Knossos. The “Neocretans” mentioned by Polybius are probably Cretan young soldiers (*neoi*). The situation where Cretans faced one another in battle was repeated at Magnesia in 190, where 12,000 Dahae mounted archers, 2,500 Mysian archers and Elymian archers, and Cretans faced, on

the Roman side, Cretans sent by Eumenes, who later accompanied Manlius Vulso on his campaign against the Galatians in 189. These forces are Cretan “symmachic contingents” sent by rival city-states on Crete.

Archidamian War (431–421). See Peloponnesian War, Second

Archidamus II (d. ca. 427/6)

Archidamus was a king from the Eurypontid royal house of Sparta. His father Zeuxidamus had died before Archidamus’ grandfather Leotychidas (II) was exiled in the mid-470s, so Archidamus came to the throne then. It is not known if he played any part in Sparta’s badly attested wars in Arcadia in the next 10 or so years. His first known achievement was to rally the survivors after the catastrophic earthquake that devastated Sparta in the 460s and to lead the first counter-measures against Helot rebels who attempted to take advantage of the situation. He presumably played an important role in the 10-year war against the rebels that followed.

In the immediate lead-up to the Second Peloponnesian War some 15 or so years later, Archidamus appears in Thucydides as an experienced military commander who unsuccessfully advised delay and careful planning in the formidable task of an aggressive war against the Athenian Empire. He commanded the first Peloponnesian invasion of Attica in 431, at the head of the largest Greek army assembled to date (said to be 60,000 strong, Plutarch, *Pericles* 33.4). His cautious conduct of the campaign, aimed at avoiding any self-inflicted disaster, provoked discontent from allies, but Archidamus realized that the chances were slight of forcing the Athenians to a decisive battle on land, which the Spartans and their allies were most likely going to win.

Archidamus commanded the allied invasions of Attica again in 430 and in 428, with the same lack of any positive outcome. In 429, the plague raging in Athens led him to divert the invasion army to Plataea, which he failed to coerce into abandoning Athens. He then subjected it to the standard Greek method of siege by surrounding it with a double-line of fortifications to starve it out.

Archidamus was a competent enough commander but was incapable of devising any strategic breakthrough to avoid the stalemate into which the Peloponnesian War was developing. That called for the genius of Brasidas, who was atypical of Sparta. Archidamus shows both the capabilities and the limitations of Sparta's conventional methods of waging war.

Archidamus III (ca. 400–338)

Archidamus III, son of Agesilaus II, was a king of Sparta from about 360 till his death in 338. In 371, he led a relief force from Sparta to support the army defeated at Leuctra. Archidamus is the first known son of a Spartan king to have held such a military command in the king's lifetime, probably because of his father's prestige. Archidamus also held commands in Sparta's wars against the Arcadians in the 360s, winning a notable success that revived Spartan morale, the "Tearless Battle" (i.e., one in which no Spartan fell), in about 368 or 367. He played an important role in the desperate defense of the town of Sparta against Epaminondas' forces in 362 and campaigned against Megalopolis in 352.

In about 356, Archidamus supported the Phocian leaders in their determination to resist Boeotia. He was thus blamed for the Third Sacred War and accused of sacrilege by acquiring some precious objects from the temple treasures. Whether he actually did so is now beyond discovery. Sparta remained an ally of Phocis throughout this war. In early 346, Archidamus led a force to help defend the pass of Thermopylae against Philip of Macedon but withdrew because of his well-based mistrust of the Phocian leaders.

Late in the 340s, Archidamus followed in his father's footsteps by taking up mercenary service abroad to raise money for Sparta's wars at home. After recruiting mercenaries who had served in the Sacred War, he sailed first to a war in Crete. He then went on to Taras (Tarentum) in southern Italy, to fight against the Lucanians. After two or more years of campaigning, he was defeated and killed, reportedly on the same day as the battle of Chaeronea (338). His reputed sacrilege was thought responsible for his bad end.

Archilochus (ca. 680–640)

Archilochus was a notable poet, highly regarded in antiquity behind only Homer and Hesiod. His poetry, now surviving only in fragments, is the earliest extant written in the first person. He covers many topics: love, melancholy, enmity, and life as a soldier, including the enigmatic: “My spear is my bread, my spear is my wine, which I drink, leaning on my spear.” Reputedly born to a wealthy father and a slave girl on Paros, Archilochus’ poverty drove him to live in Thasos and to serve, at least for a time, as a mercenary. He fought in Thrace and was killed in battle on Naxos.

In the third century, a hero-shrine honoring Archilochus was built on Paros. A first-century expansion of this building added more inscribed text, including quotations from his poems.

Archimedes (ca. 287–212)

Archimedes was one of the most famous mathematicians and military engineers of antiquity. The few factual details of his life and accomplishments must be separated from diverse popular legends that accumulated in Greco-Roman, Byzantine, and Renaissance literature. A native of Syracuse, he reportedly visited Egypt and possibly studied there; he later corresponded with mathematicians at Alexandria. His extant writings, some preserved only in Arabic translation, deal mostly with

mathematics, particularly geometrical methods for finding the area or volume of complex plane and solid objects, as well as arithmetical calculation. Reported works on mechanics and optics have not survived. His writings seem to have attracted relatively little interest until late antiquity, when they were first compiled and inspired extensive commentaries. Assessment of his contribution to the principles and practice of mechanics in the Hellenistic era is hampered by subsequent accretions to the Archimedean tradition, which typically comprise anecdotal reports of appliances he invented, constructed and/or demonstrated, notably a compound pulley for launching large ships and a hydraulic screw, though the extent and nature of his innovation remains unclear.

To ancient authors, however, Archimedes' claim to fame was largely or exclusively as an inventor of military machinery, a reputation that rests primarily on his role in the defense of Syracuse against a protracted Roman siege in 214–212 during the Second Punic War. Some years earlier, Hieron II of Syracuse (270–215) had commissioned Archimedes to design and supervise a comprehensive system of urban defense, which drew on a long-established Sicilian tradition of artillery construction and his own scientific expertise, and possibly included structural modifications to the city's fortifications. His mechanical devices figure prominently in Polybius' well-informed account of the siege, composed around 70 years afterward, and its later adaptations by Livy and Plutarch. Written from a face-saving Roman perspective, all accounts seek to attribute the temporary Roman reverse to the technological wizardry of a single exceptional genius rather than Syracusan military prowess. Archimedes had constructed and sited a large number of torsion-powered stone-throwing machines, graded in size and range, which maintained a continuous moving barrage as the Roman ships approached the seawall. At closer range, the Romans encountered torsion-powered bolt-projecting catapults or *scorpiones* firing from loopholes. On the seawall, Archimedes mounted large swing-beam cranes fitted with complex pulley mechanisms, which could drop and raise heavy weights or lift and capsize vessels using a kind of grapnel. Similar machinery employed on the land-walls repelled assaults by Roman infantry. Costly failure on both land and sea induced the Romans to resort to a lengthy blockade. When the city eventually fell to treachery in 212, Archimedes died in the subsequent sack.

The story that Archimedes burned the Roman fleet by reflecting the

sun's rays using one or several plane or parabolic mirrors first emerges around the mid-second century CE and was greatly elaborated in late antique and Byzantine literature. Despite scientific and popular attempts from the mid-seventeenth century onward to substantiate this feat experimentally, the military application of burning-mirrors must be considered unhistorical, impracticable, and unnecessary.

Arête

Arête is the ancient Greek term used widely for physical and moral excellence. In ethical philosophy, it was the standard term for “virtue” but in the everyday world it was commonly used for the good qualities esteemed and even demanded in the citizen of a *polis*, principally courage.

In Athens in the fifth century, there was a lively debate on whether *arête* was a natural endowment or could be transmitted by positive teaching. Philosophers were concerned with the related problem that, if *arête* was to be taught, it had to be adequately defined. However, to the ordinary person, *arête* was not problematic. It consisted of the qualities that the community admired most in male citizens, and in this context attention was mostly focused on courage in war. *Arête* also included moral goodness and the term could be applied in that sense to women, but in the ancient Greek world there was usually something paradoxical in applying *arête* in the sense of “courage” to women, who did not normally take part in active war.

Arête could also be used in the concrete sense of a highly praiseworthy action, almost always with reference to distinguished act of bravery in war. That the same term referred in common use to moral goodness and to bravery in combat shows how the whole ancient Greek way of thinking and acting assumed that war was a normal and natural part of human life.

Arginusae, Battle of (406)

A major Athenian naval victory over the Peloponnesians near the Arginusae Islands (southeast of Lesbos) during the Second Peloponnesian War (431–404). Although the Athenians won, the execution of six of the victorious generals after the battle for failing to recover survivors created considerable ill-feeling in Athens. The battle was fought to relieve Conon, who was blockaded in Mytilene with 40 triremes. At this stage of the war, still badly affected by their huge losses in Sicily, the Athenians could not afford to lose either Mytilene or the ships and crew there.

With something of their old energy, the Athenians launched a fleet of 110 triremes, manned by scratch crews. These included metics (resident aliens), freed slaves, and even cavalrymen (who normally did not serve on ships). These were supplemented in theater with 10 Samian ships and 30 from other allies. In response, Callicratidas, the Spartan admiral, left his army besieging Samos and sailed out against the Athenians. With only 90 triremes, Callicratidas was apparently heavily outnumbered (although Diodorus 13.97.3 states he had 140, this seems unlikely). His initial plan, presumably to mitigate his lack of numbers, a night attack, was thwarted by bad weather. The next day he deployed in a single line against the Athenians who, because of their inexperienced sailors, were drawn up in a double line to prevent the *diekplous* maneuver. Although the

Peloponnesians put up a good fight, resistance collapsed when Callicratidas was killed and they fled with the loss of 75 ships. Athenian losses were light in comparison—13 sunk and 12 disabled. Two subordinate commanders, Theramenes and Thrasybulus, were deputized to retrieve survivors while the rest of the fleet sailed to Mytilene to relieve it. Both of these moves were prevented by a thunderstorm. However, the Spartan commander at Mytilene abandoned the siege on learning of Callicratidas' defeat. Although the fleet had won a great victory and successfully achieved its mission, the postbattle aftermath left a very sour taste at Athens. The victorious generals were accused of not having recovered the Athenians in the water after the battle and were recalled to Athens. Six of the eight returned and were put on trial. What exactly happened is not entirely certain—Xenophon's account, though detailed, has been seen as an apologia for the generals—but instead of presenting a united front over the bad weather as the cause for not recovering the men in the water, the generals appear to have ended up in conflict with Theramenes and Thrasybulus over who was responsible. The six generals who had returned were executed, although the Athenians later turned on their accusers.

The Argolid was a region north and east of the Argolic Gulf, comprising a rich 100-square-mile alluvial plain, the hills to the west, and the mountainous peninsula (the Argolic Acte) to the east. In the Bronze Age, it was a major center of Mycenaean civilization, with the sites of Mycenae and Tiryns on the eastern side of the plain. In the Classical Period, the dominant city was Argos on the western side. In the Archaic Period, there were a number of independent *poleis* in the area, but from the sixth century onward Argos steadily subdued them and extended its territory to include the entire plain. The cities thus annexed included Oenoe, Nauplia (in the nineteenth century the first capital of modern Greece), Asine, Hysiae, Tiryns, Mycenae, Cleonae, and Nemea. The Argives no doubt felt that, to match the strength of Athens and Sparta with their large swathes of territory in Attica and Laconia, Argos needed to control its region; Thebes tried to solve the same problem with a tight federal structure in Boeotia. The Argive Heraion (sanctuary of Hera), which had been an independent sanctuary midway between Mycenae and Tiryns, became the great religious center of the Argive state. But the towns on the east side of the Argolic Acte, such as Hermione, Troezen, and Epidauros, generally remained independent, and the healing sanctuary of Asclepius at Epidauros became a major place of pilgrimage within the Greek world.

Argos, Argives

Argos, one of the major cities of ancient Greece, was located in the northeastern Peloponnese. It was notable for its long-standing rivalry with

and enmity toward Sparta, which led to a series of wars and battles.

As early as the eighth century, Argos aspired to leadership within the Peloponnese, and formed alliances with Troezen, Aegina, Phlius, and Sicyon. By the early seventh century, Argos was ruled by a powerful tyrant, Pheidon. After gaining control of Messenia in the shadowy first Messenian War, the Spartans decided to contest control of the Thyreatis, a territory on the borders with Argos. In 669, Sparta challenged Argive control of the territory at the battle of Hysiae, but lost. It has been suggested that the Argive victory was due to the newly created hoplites who fought heroically under the leadership of Pheidon, but this is largely speculative. Nevertheless, the result seems to indicate that in the first half of the seventh century Argos was the dominant state in the Peloponnese.

During the second Messenian War (ca. 650–630), Argos is supposed to have allied with the Arcadians, Pisatans, and Messenians against Sparta, but was defeated. By the sixth century, Sparta dominated the Peloponnese and Argos was reduced to the status of a regional power. In about 547, another battle between the Argives and the Spartans (the so-called Battle of the Champions) allowed Sparta to secure control of Thyreatis. A generation or two later, in about 494, the Argives were again defeated, at the battle of Sepeia near Tiryns—the defeated Argive army sought refuge in a grove sacred to the hero Argos. According to Herodotus, Cleomenes I, the Spartan king, ordered the complete destruction of the sacred precinct and the massacre of the suppliants. All told, Herodotus claims, around 6,000 Argive soldiers were killed.

When Xerxes invaded Greece in 480, Argos remained neutral, partly because of the painful memory of the battle of Sepeia and partly because the Argives were unwilling to take a subordinate role to Sparta, while the Spartans were unwilling to treat them as equals, with a share of the command. After the Persian Wars, the Argives allied with Corinth, Elis, and Mantinea for support against Sparta. During the First Peloponnesian War, at the battle of Tanagra in 457, more than 1,000 Argives fought on the Athenian side. Although both sides suffered heavy casualties, the Spartans were victorious. During the Second Peloponnesian War, in 418, at the battle of Mantinea, the Spartan king Agis II defeated the combined forces of Argos, Mantinea, and Athens. The following year, the Argives initiated the construction of long fortification walls, which ran from the city down to the Argolic Gulf, but the Spartans destroyed them before they were completed.

Despite its problems with Sparta, during the fifth century Argos steadily destroyed or annexed the small towns of the central Argolid, until by the end of the century it controlled the whole of the plain.

After the Second Peloponnesian War, in the Corinthian War (395–387/6) Argos allied with Corinth, Athens, and Thebes to fight against Spartan authoritative control and power. In this period Corinth and Argos joined in some close form of political union, though this was broken up at the end of the war. In the end, Sparta was victorious, but its hegemony had been shaken. Later in the fourth century, after the battle of Chaeronea in 338, the Argives allied with Philip II of Macedon, who claimed descent from Argive ancestors. After the death of Alexander the Great, Argos did not join in the Lamian War against Macedonia, but remained loyal to Macedonia into the reign of Antigonos II Gonatas. In 229, Argos joined the Achaean League; during the Roman period, the territory of Argos became part of the province of Achaia.

Aristagoras (Late Sixth–Early Fifth Century)

Aristagoras was governor of Miletus, while the tyrant, his father-in-law and cousin, Histiaeus, was detained in Susa by Darius. Aristagoras was an instigator of the Ionian Revolt, which led to the First Persian War. Herodotus' main account is in Book 5.

Asked by some exiled aristocrats of Naxos for assistance against those who had exiled them, Aristagoras saw an opportunity to become the ruler of Naxos himself. He promised to obtain aid from the Persians to reinstate the exiled Naxians. He convinced Darius and Darius' brother, Artaphrenes, to mount an expedition to subdue Naxos, with the further prospect of bringing nearby islands into the Persian Empire.

Aristagoras accompanied the Persian fleet of 200 ships but argued with the Persian commander before they arrived. The commander thereupon sent word to the people of Naxos, warning them about the coming attack. As a result, the Naxians were well prepared, and the attack failed.

In serious debt to the Persians, Aristagoras (encouraged by Histiaeus) revolted from Persian rule, inciting rebellions around the area and establishing *isonomia* (equality before the law) instead of puppet tyranny (499). He failed to involve the Spartans in the Ionian Revolt, but convinced the Athenians to send aid consisting of 20 ships. These troops conquered and burnt down Sardis. The Persians pursued the retreating Ionians, defeated them in Ephesus, but only finally put an end to the revolt in 493. Aristagoras fled to Thrace and was killed by the locals.

Aristides (d. post-467)

Aristides was an Athenian soldier and statesman of the first half of the fifth century. He played a prominent role during the Persian Wars, was

influential in the foundation of the Delian League, and is a good example of early fifth century Athenian aristocratic political and military leadership.

Aristides was the *strategos* (general) in command of the contingent of his tribe, Antiochis, at the battle of Marathon in 490, apparently performing well enough to become *archon* in 489/8. In the ensuing years he clashed with Themistocles, perhaps opposing Themistocles' emphasis of naval over land power—although political conflict in Athens at that time was often family-based and involved multiple rather than single issues. As a result of this, Aristides was ostracized (exiled) in 482.

Aristides was recalled early from his 10-year ostracism to assist in the Second Persian War. He served as *strategos* from 480 to 479, and at Salamis (480) brought the Greeks the news that the Persians had blocked their retreat and then led the hoplite contingent that cleared the Persians from the island of Psyttaleia. Aristides also commanded the Athenians at Plataea (479).

Aristides took part in the postwar campaign in the Hellespont and alongside his fellow conservative colleague Cimon, seems to have been instrumental in persuading the Ionian and island Greeks to follow Athens rather than Sparta. Aristides was famous for his honesty and was nicknamed “the Just.” Because of this he was asked to assess the tribute contributions for the members of the newly formed Delian League. Tradition records that he died of natural causes, in very modest financial circumstances, having refused to capitalize on the opportunities for corruption offered by his public offices.

Aristonicus (d. ca. 129)

Aristonicus was a pretender to the throne of Pergamum. After the death in 133 of the Pergamene king Attalus III, who bequeathed the kingdom to the Roman people, Aristonicus claimed the kingdom for himself, asserting that he was a son of Eumenes II (reigned 197–160/59), and taking the dynastic name Eumenes III.

Although the Roman tribune of the plebs Tiberius Gracchus quickly secured the Pergamene treasury by legal means to fund his land redistribution scheme in Italy, Roman military control of Pergamum took a long time to establish. Aristonicus took advantage of Rome's inaction, trying to entice the Greek cities of Asia Minor to his cause with promises of freedom from Roman control. He was defeated in battle by the Ephesians near Cyme. Aristonicus then turned to the interior of Asia Minor, appealing to the rural poor and enslaved, whom he dubbed Heliopolitae, citizens of Sun-city, to rise up against the urban Greeks. Massacres ensued in the cities until a coalition of urban Greeks and local kings united against the movement.

In 131, a Roman army under praetor Publius Licinius Crassus arrived, but was defeated at Leucaea in 130; Crassus was captured and killed. Crassus' successor, the consul Marcus Perperna, surrounded and captured Aristonicus in 129 at Stratonicea on the Caicus. Aristonicus was taken to Rome and executed. Perperna's successor, Manius Aquilius, mopped up the revolt's remnants.

Aristophanes (Second Half of Fifth Century)

Aristophanes, son of Philippus, was the master of Old Attic Comedy. Born sometime between 457 and 445 and dead by 385, he seems to have been of

hoplite status, possibly owning property on Aegina. Eleven of his plays survive, along with numerous fragments from 30 or so lost works. All but two of his plays—*Ecclesiazusae* (*The Parliament of Women*) and the second *Plutus* (*Wealth*)—were produced during the Second Peloponnesian War (431–404). If used with caution appropriate to the exaggeration inherent in comedy, the plays provide valuable insights into Athenian attitudes and reactions to the war, as well as occasional insight into its details, course, and effects. Plays with a particular war focus are: *Acharnians* (425), *Knights* (424), *Peace* (421), and *Lysistrata* (411).

Arms and Armor

The arms and armor of the infantry and cavalry of ancient Greece varied considerably over time, and to a lesser extent by region. However, it is broadly true to say that the general trend for infantry was to move toward lighter armor, sacrificing protection for mobility, while cavalry seems to have moved toward more protection. Weapons and armor naturally developed in concert with developments in tactics and techniques, although at times it is difficult to decide which influenced the other more.

Archaic Period (ca. 700–480)

At the beginning of the Archaic Period, the nature of warfare in ancient Greece was moving toward the widespread employment of the massed phalanx formation. Unfortunately, there is a lack of contemporary source material for the study of Archaic Period warfare and even less for the preceding period. Much of our understanding comes from artistic representations of combat—such as the famous Chigi vase (ca. 650; see illustration in “Chigi Vase” entry), the archaeological record, and Homer’s

Iliad.

The warrior of the Archaic Period was the predecessor of the later classical hoplite but with variations in much of the armament reflecting the technological abilities and combat of the time. The earliest Archaic helmet found in Greece (ca. 700) is of the *Kegelhelm* (“cone” or “kettle”) type. The *Kegelhelm* was a bronze conical, open-faced, helmet, made from five separate pieces riveted together, with elongated “sideburns” that extended down to protect the side of the face and head. On top of this helmet sat an elaborate semicircular crest mounted on a high stilt. The *Kegelhelm* was succeeded around 650 by the “Illyrian style” (see illustration)—a type that still incorporated the open face and elongated sideburns of the *Kegelhelm*, but was made in two separate halves and had a metal ridge running front-to-back across the helmet instead of a crest (although some examples seem to have carried crests as well). Advances in manufacturing techniques by the mid-sixth century allowed the Illyrian style helmet to be made from a single sheet of beaten bronze.

The early “Corinthian style” helmet developed independently from the *Kegelhelm* and Illyrian helmet. It was an all-encompassing bronze helmet, approximately 2-millimeters thick in this period, with only a “T”-shaped opening for the eyes, nose, and mouth (see illustration). Early Corinthian helmets were made in two separate halves riveted together down a central ridge. The earliest examples of the Corinthian helmet lack the elongated cheek pieces of its later versions and are generally flat along the bottom. Rudimentary cheek pieces begin to appear ca. 550—although as early as the seventh century small notches were cut into the lower edge of the helmet to distinguish the jaw-line from the neck.

The Illyrian helmet first appeared ca. 650 and was originally made from two pieces of bronze—an advance on the five pieces of its predecessor, the *Kegelhelm*. It combined reasonable protection with good vision. (Illustration by Mary Dearden)

The Corinthian helmet first appeared in the Archaic Period, but only developed the extended cheek pieces ca. 550. It provided much better protection than the Illyrian helmet, but sacrificed hearing and vision to do so. (Illustration by Mary Dearden)

Many early Corinthian helmets were also adorned with crests of stiffened horse hair, with a stilt style of mounting—similar to those on the *Kegelhelm*—being one of the most common. However, a crest running from front to back and that sat flush on the surface of the helmet was also common. The crest served a number of purposes: it demonstrated wealth (horses were expensive to maintain); it made the wearer look taller and more imposing; and the crest removed the crown of the head (the point where an incoming, downward, impact was most likely to pierce the plate) as a possible place of attack. The use of crests in this manner continued throughout the development of the Greek helmet into the Classical Period.

There were two main types of shield in early Archaic Greece. The first was the “Dipylon shield”—an oval shaped shield with a semi-circular scallop cut out from either side—apparently a development from the Mycenaean Era “Figure 8” shield (see illustration in Trojan War, Course entry). From the artistic portrayals, the Mycenaean shield seems to have been made from a hide-covered wicker framework—the supporting struts, or “stretchers,” of which created its unique shape. However, what the Dipylon shield was made of is unknown—there are no surviving examples. The other type of shield was a round bronze shield with a central handgrip. Herodotus attributes the invention of shields with handles (as well as the first use of crests on helmets and painted shield designs) to the Carians of Asia Minor—although round shields may have originated in central Europe like much of the weaponry introduced in the late Mycenaean Period. Examples of this kind of shield from Delphi have either a pronounced central boss covering a hand-grip flush with the surface of the shield, or no boss that suggests a protruding grip. Such shields were replaced by the hoplite *aspis* in the seventh century.

Body armor developed considerably during the Archaic Period. The eighth century “Argos Panoply” includes (along with a *Kegelhelm*) a cuirass of plate bronze, shaped and decorated to represent a human torso. The cuirass has two plates (front and back) held together with a pin and hinge system on the sides, and pegs and holes on the shoulders. This meant that assistance would have been required to put this armor on. The armor also had a raised collar to protect the throat, and ended in an outwardly angled flange at the base, which sat on the hips. From the front-lower edge of the corselet a semicircular plate of armor (*mitra*) could be suspended to provide protection for the groin. By the second half of the sixth century, the popularity of the “bell corselet” had declined as other forms of armor came into fashion, such as the bronze “muscle cuirass” and the composite *linothorax*.

One element of defensive armor that remained in constant use across the Archaic Period was the greave. Coming into use in the seventh century, greaves originally only protected the shins and were basic in shape. However, greaves developed to cover the knee and conform to the shape of the lower leg, allowing them to be held in place by the elasticity of the metal instead of straps. The Archaic Period also saw the development, and then abandonment, of armor for the upper arm, thigh, and foot. Much of

this extra armor fell out of fashion by the mid-sixth century as Greek warfare changed from the open form of missile-based warfare and individual combats to the densely packed thrusting combat of the phalanx.

In many images the Archaic Greek warrior carries two spears—one noticeably shorter and thinner than the other. The longer weapon is a thrusting spear, the smaller one a javelin (indicated by the depiction of a throwing loop (*angkylos*) used to gain greater leverage when the weapon was thrown). The javelin possessed a small iron head, (around 95 grams) attached to a shaft around 20 millimeters in diameter and had a small “butt-cap” (*styrakion*) (around 90 grams) on the other end. This gave the javelin a central point of balance perfect for a thrown weapon. The thrusting spear was about 2.5 meters in length, with an iron spearhead mounted on a shaft approximately 25 millimeters in diameter, and with a large bronze spike (*sauroter*) on the other end. This weapon would have had a point of balance 90 centimeters from the rearward tip—giving the bearer a considerable reach. The javelin weighed around 900 grams, the thrusting spear around 1.5 kilograms.

The Archaic Period hoplite also carried a sword. The most common form was the Mycenaean II type, of Central European origin—a long, straight, double-edged sword of bronze or iron around 75-centimeters long. The sword possessed a small, tapered hand-grip covered with wood or bone and was weighted toward the front—making it ideal for slashing or thrusting.

The full panoply of an Archaic Period warrior would have been cumbersome—exceeding 25 kilograms. As fighting styles changed, elements of the panoply were altered or discarded to make the hoplite lighter.

The issue of Archaic cavalry arms and armor is more complex. Archaic art regularly depicts cavalrymen as fully equipped hoplites, but there is considerable debate over whether these are true cavalry or mounted infantry. Riders equipped with javelins and no armor (like the later Greek cavalry) are also depicted, although less commonly. The only item of horse armor attested is the *champhrein* or protection for a horse’s face, which appears in both the artistic and archaeological record.

Classical Period (ca. 480–323)

Herodotus (2.152) records an Egyptian oracle about “men of bronze” who turned out to be Greek hoplites in bronze armor. The arms and armor of the Classical Period were designed for frontal, hand-to-hand, combat. To fight

as a hoplite only the large hoplite shield (*aspis* or *hoplon*) and the long thrusting spear (*doru*) were mandatory—everything else was an optional extra. This was because most city-states fielded only part-time citizen militias who were responsible for supplying their own equipment. Considerable variety probably existed in the equipment of city-state hoplites because of differences in wealth and personal taste and whether older armor was handed down from father to son.

The hoplite may have worn a bronze helmet (*kranos*). During the early Classical Period, the most common form of helmet was the “Corinthian style.” Better manufacturing techniques allowed these helmets to be made thinner than previously while still providing similar protection. The Corinthian helmet, while enclosing most of the head, still provided the wearer with a natural range of vision. However, the helmet did restrict the hearing of the wearer until the later fourth century when openings for the ears were incorporated. The Corinthian style helmet took considerable time and skill to manufacture and during the Peloponnesian War (431–404), helmet design took a radical turn with the widespread adoption of the basic conical *pilos* (see illustration). While still made of bronze, the *pilos* sacrificed the protection to the face and throat provided by the Corinthian helmet in exchange for speed and ease of manufacture—no doubt because the city-states needed to rapidly equip and deploy larger armies. The conical shape replicated the protection provided by the crest of other helmets by placing a cone of plate bronze over the crown of the wearer’s head to deflect blows.

The hoplite shield (*aspis* or *hoplon*) was 90 centimeters in diameter (see illustrations in Hoplites entry). Constructed from a wooden core, occasionally faced with bronze, the *aspis* had a bowl-like shape 10-centimeters deep with an offset rim 5–7-centimeters wide around its circumference. The shield was carried by inserting the left forearm through a central armband (*porpax*) and grasping with the left hand a cord (*antilabe*), which ran around the inner circumference of the shield (see the illustration in Chigi Vase entry and the first illustration in Phalanx entry). The concave shape allowed for some of the shield’s weight (7–8 kilograms) to be supported on the shoulder. When held for battle the shield protected the bearer from cheek to knee and allowed for the creation of different combat formations, including the close-order shield wall. Shields were decorated with a variety of blazons ranging from geometric designs, religious symbols, representations of personal characteristics, national

emblems, or images to intimidate opponents. This made Greek arms and armor in the Classical Period very individual and the armies very colorful—except for those with a standard “uniform” like the Spartans.

The *pilos* helmet was originally made of felt or leather. The bronze version was popular in Sparta and widely adopted during the Second Peloponnesian War (431–404). Although lacking the same level of protection as the Corinthian or Chalcidian helmets, the *pilos* was cheaper and easier to produce in quantity. (Illustration by Mary Dearden)

The body armor (*thorax*) of the hoplite could have been one of two types: a bronze plate cuirass approximately 1 millimeter thick, or the composite *linothorax*—made from gluing several layers of linen and/or hide together to make a material not unlike modern Kevlar. From the bottom of the *linothorax* hung a series of flaps (*pteryges*), which protected the groin

and thighs without restricting the movement of the upper legs. The bronze “muscle cuirass” of the fifth century (see illustration) was shaped to represent a naked torso and served a number of purposes: it demonstrated wealth (this type of armor was costly); it made the wearer look more imposing; and it reduced the number of flat surfaces on the armor—the stylized muscles helped deflect incoming strikes. The total weight of either bronze or linen armor was around 5.6 kilograms. The hoplite’s legs could have been protected with a set of bronze greaves, weighing around 1 kilogram, shaped to fit onto the lower leg, and held in place by the elasticity of the metal.

The thrusting spear (*doru*) remained relatively unchanged from its Archaic predecessors: 2.5 meters in length and with a leaf-shaped iron head (around 150 grams), a shaft 25 millimeters in diameter, and a large bronze butt-spike (around 330 grams)—giving the *doru* a point of balance 90 centimeters from the rear end. The total weight of the *doru* was about 1.5 kilograms. Swords could have been either a large, single-edged, curved hacking sword (*kopis* or *machaira*) or a double-edged thrusting sword with a leaf-shaped blade (*xiphos*)—carried at the left hip suspended from a strap over the right shoulder (see first illustration in Phalanx entry). Depending upon style and size, the hoplite sword could weigh up to 2 kilograms.

When the hoplite’s tunic, footwear, and any padding worn under armor and helmet are considered, the total weight of a classical hoplite panoply was around 20 kilograms. Despite this encumbrance, the hoplite was very well protected. When positioned for battle, around only 5.5 percent of his body remained exposed (the right arm, left knee, left foot, and those areas exposed by the openings of the helmet). This made the hoplite exceptionally well suited to hand-to-hand combat and made him one of the most sought after fighting men of the ancient world.

A late-fourth-century bronze “muscled” cuirass, from Canosa, Ipogeo Varrese. This is a particularly elaborate item from Magna Graecia, but like its mainland Greek equivalents, it was probably custom-fitted for the owner and therefore too expensive for the ordinary soldier. Located in the Archaeological Museum, Bari, Italy. (Leemage/Corbis)

Cavalry did not follow the general infantry trend to sacrifice some protection for enhanced mobility (and mass-production). Mobility came from the horse, not lighter armor, and cavalymen were generally drawn from the wealthier classes so cost was not such an issue. In general, cavalymen wore a helmet, usually of an open-faced design, a breastplate (often bell-shaped to permit freedom of leg movement while mounted), and heavy boots to protect the lower legs and feet. No shield was carried (except

in some parts of Greek Italy). As with the infantry, resources and personal preference resulted in considerable variation. The standard armament was two javelins, or two javelins and a thrusting spear, supplemented by a sword, generally the *machaira*.

Hellenistic Period (ca. 323–30)

Aelian describes the pikeman of the Hellenistic Period (the *phalangites* or *peltastes*) as “medium infantry” (*Tactics* 2). The arms and armor of the phalangite were designed for fighting in the massed formation of the Macedonian phalanx (see second illustration in Phalanx entry). To fight as a phalangite only the small phalangite shield (the *pelte*—hence the term peltast, meaning “one who carries the *pelte*”) and the two-handed great spear (*sarissa*) were mandatory. The forerunner to the Hellenistic phalangite may have been created by the Athenian Iphicrates in 374 when, according to Diodorus, hoplites were rearmed with a longer spear, smaller shield, and renamed peltasts. The Macedonian military became a professional institution under Alexander II and Philip II between 371 and 350, and adopted the *sarissa*-wielding phalangite as the core of the army. During this period, many elements of the phalangite’s offensive and defensive equipment became standardized.

Body armor could include greaves to protect the legs, and Hellenistic phalangites commonly wore the composite *linothorax* to protect their torso. The most common form of helmet worn by the Hellenistic phalangite was the conical *pilos*—probably because the Macedonian army was equipped by the state—although other styles of open-faced helmet, such as the Thracian, Phrygian, and Chalcidian (see illustration) also seem to have been worn. Some of these helmets could have been adorned with crests, which may have indicated rank. The more open nature of many of the helmets worn by the Hellenistic phalangite not only provided better ventilation for the wearer but was also indicative of the differences in fighting style between the phalangite and the classical hoplite.

Asclepiodotus describes the *pelte* as being about 65 centimeters in diameter. Constructed from a wooden core and faced with a metallic covering (anything from bronze to silver to gold), the *pelte* had a shallow bowl-like shape less than 10-centimeters deep. The *pelte* was carried by inserting the left forearm through a central armband and then passing the left wrist through a strap on the outer edge of the shield. The shield was

further supported by a strap that went across the body and sat on the right shoulder—allowing the weight (5–6 kilograms) to be partially taken by the shoulder rather than solely on the left arm. The *pelte* provided protection from shoulder to thigh when it was held in a defensive position. Importantly, the smaller diameter, and the use of a wrist strap rather than a hand grip, allowed the left hand to extend beyond the rim of the shield to grip the phalangite's lengthy and weighty *sarissa*.

The Chalcidian helmet replaced the Corinthian helmet as the most popular helmet in Greece and Magna Graecia in the mid-fifth century. Combining good protection with better hearing and vision than the Corinthian helmet, the Chalcidian helmet was better suited to the increasingly fluid warfare from the Second Peloponnesian

War (431–404) onward. (Illustration by Mary Dearden)

The *pelte* was decorated with motifs indicative of the professional nature of Hellenistic armies and the standardization of equipment. Some suggest that many units within a Hellenistic army carried shields bearing emblems representing that unit. The sources show a variety of central motifs including portrait busts, rosettes, lightning bolts, monograms, and elephants, generally surrounded by a series of concentric semi-circle and pellet decorations. Whether these symbols were representative of particular commanders, individual units, or whole armies is uncertain.

The primary offensive weapon of the phalangite was the *sarissa*, which varied in length across the Hellenistic Period. Although there is some debate, the Iphicratean peltast was probably armed with a long spear about 500 centimeters in length. In the second half of the fourth century, the *sarissa* varied between around 480 centimeters and 580 centimeters. By the mid-Hellenistic Period (ca. 300) the length of the *sarissa* appears to have increased to about 770 centimeters. However, by the late Hellenistic Period (ca. 168), the length of the *sarissa* seems to have been reduced again to about 670 centimeters. There is some debate over whether the *sarissa* came in two separate pieces for ease of transportation. A cylindrical metal tube found outside a grave at Vergina, Macedonia has been interpreted by some as a connecting tube for the two separate halves of a segmented *sarissa*. Other scholars dismiss this hypothesis, arguing that the *sarissa* came with a single-piece shaft.

Regardless of the length and configuration of the weapon, the *sarissa* was tipped with a small iron head (174 grams)—Grattius (*Cynegetica*, 117–120) describes *sarissae* as having “small teeth.” On the rear end of the shaft sat a hefty butt-spike (1.5 kilograms). This gave the *sarissa* a point of balance 96 centimeters from its rearward end. When presented for combat, the vast majority of the weapon projected forward of the person bearing it. The total weight of the *sarissa* was around 5 kilograms and required both hands to wield—hence the importance of allowing the left hand to extend beyond the rim of the shield.

The phalangite’s sword seems to have primarily been the double-edged thrusting *xiphos*—carried at the left hip and suspended from a strap that ran across the body and sat on the right shoulder. This sword could weigh up to 2 kilograms.

The total weight of a phalangite panoply, including the longest *sarissa*, was around 23 kilograms. Despite the smaller *pelte*, the phalangite was still well protected. When positioned for battle, additional protection was provided by the length of the *sarissa*. Plutarch (*Aemelianus* 19) states that at Pydna (168) the Macedonians pressed the tips of their *sarissae* against the shields of the Romans and kept them at bay. Thus the length of the *sarissa* could be used to keep an enemy at a distance where he could not attack. This gave the phalangite a distinct advantage over other warriors armed with shorter-reach weapons so long as the phalanx was maintained, and made him one of the most effective types of soldier for over 150 years.

There was a significant trend toward heavy cavalry in the Hellenistic Period. Padded or even scale armor was used to protect the horse's chest and sides—and sometimes also the rider's legs. Equipment was more standardized, the thrusting spear became more common, and the *machaira* or similar slashing sword remained as the secondary weapon.

Arrian (ca. 89–ca. 180 CE)

Arrian (full name Lucius [or Aulus] Flavius Arrianus) was from a distinguished family of Nicomedia in Bithynia with Roman citizenship. Arrian was consul at Rome in (probably) 129 CE and governed Cappadocia 132–137 CE. Arrian was among the first Roman citizens from the eastern

provinces to reach the top of the Roman elite.

Late in life Arrian retired to Athens, the center of culture. He held the archonship there (148/9 CE) and devoted himself to writing. He was one the leading Greek writers of his day and was known as the “New Xenophon” after his chosen model as a historian and philosopher.

Arrian’s works are numerous and varied. Four out of eight books survive of his record of the *Discourses* of the Stoic moralist Epictetus, with whom Arrian had studied in his youth. He also produced a *Handbook* (*Enchiridion*) of Epictetus’ teaching. From his time in Cappadocia came his *Voyage around the Black Sea* (based on an official inspection of Roman forts), *Deployment against the Alani* (based on his experience of an invasion by this tribe) and *Tactica* in the tradition of military treatises.

Arrian wrote a number of historical works. One, *A History of Events after Alexander* in 10 books, covering 323–321 in great detail, survives only in excerpts. Others are lost: *A History of Parthia* in 17 books and *A History of Bithynia* in eight. The title of his surviving historical work, *The Anabasis of Alexander*, self-consciously reflects his model, Xenophon’s *Anabasis*. The *Anabasis* is supplemented by a short *Indica* on the geography of India.

Arrian’s *Anabasis of Alexander* stands out among ancient writers on Alexander the Great as the most detailed, coherent and serious-minded. Arrian based himself on the (lost) works of two contemporaries of Alexander, Ptolemy I and Aristobulus. He prided himself on being the first to create a historical work on Alexander that was in keeping with his fame and importance (1.12). Arrian idealizes Alexander as a heroic figure and there are lapses and misunderstandings, but his work is the bedrock on which the study of Alexander must rest.

Art (Ancient), Greek Warfare in

War was a hugely popular subject in ancient art across all media. Images pertaining to warfare and warriors appeared almost as soon as the Greeks began to put figures on their pottery; among the first figured scenes in the Geometric period (eighth century) are scenes of battles on land and sea. Scenes of arming and departure as well as scenes of conflict, both mythical and non-mythical, form a substantial part of the surviving corpus. Rarely, however, can scenes of warfare in art be taken as straightforward depictions, and care must be taken when using them as historical sources. As Tonio Hölscher notes, “war in art is not war, but art” (Hölscher 2003, 2). Yet such art was created to evoke the nature of war, even if it did not do so through accurate factual depiction. In all periods and despite all the difficulties in its interpretation, the importance of art as a social document cannot be overstated. As Hölscher goes on to point out, “images in war are no mere visual fictions; they refer to hard, profound, and complex experiences in real life.” Images present a nuanced and selective expression of a variety of cultural perceptions and allow us an unparalleled insight into ancient Greek constructions of warfare.

Media

The artistic media available to us have been drastically reduced by the accidents of survival. Losses include wall paintings, textiles, and works in perishable materials such as wood. These are mainly known from scattered descriptions in literary sources, although tomb-paintings lately unearthed in Macedonia indicate that the paraphernalia of war were probably a commonplace theme. Freestanding sculpture has a higher survival rate. Although most bronze sculptures (the favored medium) have been melted down, many lost Greek bronzes are more or less accurately preserved in Roman copies (see illustrations in Pericles and Themistocles entries). In terms of the depiction of conflict, however, freestanding sculpture is of limited importance—statues or groups rarely depicted actual conflict even when they were erected in commemoration of specific battles or events. A notable exception to this is the Tyrannicide group of the slayers of

Hipparchus (one of the Peisistratidae), erected in Athens ca. 480. This shows the two attackers lunging forward; their target was not included in the group, but viewing it from its most effective angle places the viewer in the position of their victim. It is not until the Hellenistic Period, however, that action groups became more popular in freestanding sculpture, and the theatrical, grandiose style known as Hellenistic baroque was used to characterize the heroic drama of martial conflict.

To the end of the Classical Period, therefore, the most useful media for the historian are relief sculpture from major public buildings (mostly temples), which often did show complex struggling groups, and, in the sixth to fourth centuries, vase-paintings. Relief sculpture is public art, and therefore reflects a carefully constructed public identity and is usually conservative in its subject. This is generally true even of privately commissioned pieces such as grave *stelae*. Vase-painting, by contrast, was made for private consumption; its approach is far more flexible and varied. Nonetheless, however personal, it also reflects themes of broader social relevance at the time it was produced. Consequently, when vase-painting and sculpture depict the same subject, they often take radically different approaches. All these concerns qualify attempts to recover the realities of ancient warfare from ancient art. In addition, while surviving sculpture is from all over the Greek world, relevant figured vases are predominantly Athenian. Though they were widely exported, it is not clear how this affected their content, and with few exceptions Attic vase-painting should be viewed as reflecting Athenian society.

In the Hellenistic Period the picture changed. Vase-painting is no longer relevant to our subject and monuments commemorating wars were more likely to depict conflict or its aftermath (see illustration). Most of the monuments that had been state-sponsored were now the donations of wealthy individuals—and of Hellenistic rulers. The underlying ideology therefore shifted to emphasize individual power and prestige. Links to the classical past were also underlined. A gift to Athens from the Attalid rulers in Pergamum of four statue groups of battles is a good example. These groups, erected on the Acropolis, underlined Attalid military supremacy, with one group depicting their victory over the Gauls, but also equated their victories to Athens' by-now legendary defeat of the Persians, which was depicted in another group.

Conventions

For the Greek Archaic and Classical Periods (seventh–fifth centuries), at a time when warfare increasingly involved mass fighting in a hoplite phalanx, artistic media focused almost exclusively on the one-on-one duel. This is true even of long narrow sculptural friezes showing armies at war: the battle was still generally shown as a series of duels between individuals. This is often explained by a desire to depict the protagonists as heroic, placing the contemporary warrior in the context of Homeric valor and fame, or presenting an idealized epic view of warfare more generally. Another consideration in the preference for depicting the duel rather than the phalanx is the isolation of the crucial moment at which battle is joined. This is the moment when every man must fear, fight, and die alone, and when his world is narrowed down to only those companions or enemies who are right next to him. The assertion of the nobility and heroism of war thus stood alongside a recognition of its cost.

The pathos of loss associated with war becomes increasingly evident in art from the late sixth century (see illustration in Naval Warfare entry). One of the most effective expressions of it is found in the many scenes of departing warriors in vase-painting, in which a young warrior bids farewell to his family (often his wife and/or his father) who pour a libation for him or assist him with his armor. Classical Athenian grave *stelae*, even those apparently erected for warriors, often dwell on this familial aspect in quiet scenes of family greeting rather than active scenes of conflict. In contrast, *stelae* erected by the state for war graves show the deceased as triumphant in battle, heroizing the service of the dead to the state. From an early stage, this sympathy for the deceased is extended to outsiders: already sixth-century vase-paintings show dead Amazons carried from the field by their companions. Even more noteworthy in this context, in some mythical conflict scenes, not every Greek defeated his opponent. The Parthenon metopes (relief panels) include depictions of Greeks vanquished or killed in battle with centaurs. All these factors perhaps contribute to the lack of bloodthirstiness in most combat scenes: a warrior may be shown bleeding and dying but mutilation and cruelty are avoided in art unless the traditions of a mythical scene specifically call for it.

Scenes of conflict in Greek art are often broadly divided by modern scholars into those with identifiable mythical protagonists as opposed to the many unlabeled and unidentifiable scenes of warfare, generally described as

contemporary generic or “daily life” scenes. Both follow similar conventions and undoubtedly include realistic elements. The identification of specific mythical scenes in art depends on repeated formulae for particular actions (Greek art employs a sophisticated language of gesture and pose), characteristic attributes (e.g., Heracles’ lion skin, the Amazons as female warriors), and (far more rarely) identifying inscriptions. Without the aid of inscriptions, few warriors in mythical combat scenes are readily identifiable since little distinguishes one warrior in armor from another, nor is it always evident whether the scene is intended as mythical or generic. Many scenes of course operated as both, an ambivalence that was probably deliberate, as attributes that could have been made distinctive such as helmet type or shield device vary according to the artist’s preference. It is unlikely, in any case, that the ancient viewer would draw the modern distinction between mythical and generic scenes; he could identify as readily with Achilles killing Hector as with an anonymous hoplite killing his adversary.

Aspects of contemporary warfare are clearly apparent even in the case of the mythical images. Warriors are often shown in hoplite panoply and pose, legs spread wide and braced, shields held at an angle in front of them and resting against their left shoulders, spears at the ready. Although artists often depicted protagonists as dead, defeated, or on the verge of defeat—that is, as wounded or fleeing or at a disadvantage—it was also common for them to represent a combat between equals, in which it is not immediately clear who has the upper hand. Conventionally, the loser was placed on the viewer’s right, and if the combat was over a dead body, the head of the deceased pointed toward his friends (see the first illustration in *Hoplites* entry).

Art as a Source for Armor and Military Technique

Notwithstanding the conventions and ideological biases that affect ancient art, depictions of conflict are frequently utilized as sources for historical aspects of warfare. Scholarship in this area is wide-ranging but two areas in which ancient art offers a rich trove of factual detail are the details of ancient armor and the evolution and fighting technique of the hoplite phalanx.

Depictions of armor are frequently precise and detailed. Recent reconstructions of the *linothorax* (a cuirass made from layers of linen) by Gregory Aldrete and his colleagues have been made possible by over 900

representations of the *linothorax* on 486 artworks, which give sufficient detail to materially assist its modern reconstruction. Images of shields show the development from the single hand-grip shield to that with an armband in the center (*porpax*—see the first illustration in Phalanx entry) and a hand-grip at the rim (*antilabe*), and may also include details such as the shield-aprons that hang below the shield to protect the legs from arrows, and a cord strung around the inside of the shield, the purpose of which is still unclear. Often a warrior appears in the complete and historically accurate hoplite panoply including corselet, helmet (usually Corinthian), and greaves, along with the hoplite shield, spear, and sword (see the first illustration in Hoplites entry).

Nonetheless, dress, too, is subjective. Types of shield, armor, and helmet may vary, and combatants are frequently shown armed yet naked—even though in reality the Greeks never went into battle naked (see second illustration in Hoplites entry). Nakedness in Greek art has multiple meanings and is contentious. However, in the representation of the warrior it is often taken to signify strength, courage, skill, and manliness—or in the case of the warrior killed and stripped by his enemy, the futility or negation of these traits. It may also demonstrate the high value placed upon physical strength and agility.

While details of armor or weaponry could be used to distinguish one side from another (e.g., Attic versus Corinthian helmets), opposing combatants often are equipped identically, reflecting the internecine nature of the wars fought by the Greek *poleis*. Until the Persian Wars, the primary threat to any mainland Greek *polis* came from other Greeks, and the ground between allies and enemies could shift rapidly.

Depictions in art are also an important source for the study of the development of the hoplite phalanx, for which our literary sources are sketchy and unclear. There are only eight depictions of the hoplite phalanx, all from the Archaic Period. Although these are often used to investigate the development of the phalanx, it is far from clear how best to interpret them.

In the only relief sculpture depicting the phalanx in action (see first illustration for Phalanx entry), the relief frieze depicting a Gigantomachy (the myth of the gods defeating primordial giants) from the north side of the Siphnian Treasury at Delphi (ca. 525), the phalanx is negatively portrayed. It is the giants who are depicted as hoplites, in full armor, faces hidden by helmets, some advancing in step, whereas the gods—including females—

have diverse clothing and armor and fight as individuals or pairs rather than as a group. The significance of this is debated, but has been thought to relate to Siphnos' commitment to aristocratic (i.e., Homeric and heroic) privilege, and its lack of interest in the kind of centralized military organization that produced an effective hoplite phalanx. A simpler explanation is that the giants are depicted as mortals, exhibiting the kind of hubris that inevitably invites retribution. In any case, the importance of local context—the Siphnian origin of the treasury as well as its location in the sanctuary of Apollo—has certainly influenced the artist's choices, and any interpretation needs to recognize the ramifications of the tension between accuracy and ideology in Greek art.

Myth and History

The rarity of the phalanx in ancient art is due in part to the fact that until the end of the sixth century, Greek artists avoided depicting scenes of specific historical battles. Artists preferred to reflect on specific historic events by way of an appropriate mythical scene, although at the same time they often depicted precisely correct details of dress and fighting technique. This approach remained popular down through the Hellenistic Period. Thus a change in the iconography of the Amazonomachy (battle between Greeks and Amazons) is usually associated with the Persian Wars: early fifth-century Amazons often wear the elaborate Persian trousers, tunic, and cap, whereas their earlier counterparts were dressed in Greek *chiton* and armor. This association is thought to stem from shared factors such as Amazon and Persian skill as cavalry, their love of ornamentation, and the proximity of the mythical Amazon homelands to Persia. It is also significant that the Amazons always ultimately lose the fight against the Greeks. Lately, however, this approach has been questioned, both in its specifics—the garb of the Amazons has been seen as Scythian—and more broadly, most recently, and radically by Suzanne Muth.

Although mythical parallels along these lines were common in Greek art, they remain complex and controversial. In addition to the Amazonomachy, artists also made use of three other great myths of Greek superiority: the Gigantomachy, the Centauromachy (the defeat of predatory centaurs by Greek heroes), and—a perennial favorite—the Trojan War. After the Persian Wars any or all of them may be read as a reference to the Greeks' victory over the Persians, although debate persists over the extent

of the Persian Wars' influence on Greek art. More importantly, however, these canonical battles defined male Greek citizen identity against outsiders. In sharp contrast (for example), the incidence of scenes showing the sack of Troy rises in the early fifth century, around the time of the Persian Wars. In these scenes, the Trojans are shown as the noble defenders of their households whereas the Greeks are shown in a bad light, killing children and the elderly, raping women, and committing sacrilege: Troy's fall is illustrated through the brutal destruction of its ruling family. The popularity of these scenes around the time of the sack of Athens by the Persians is unlikely to be coincidental, but the interpretations here are not straightforward.

The choice of subjects for scenes of conflict in temple sculpture is more restricted, but battles are particularly favored for pediments since dying men fit nicely into the awkward corners. The favored conflicts for temple sculpture are the four already mentioned: the Gigantomachy, the Centauromachy, the Amazonomachy, and the Trojan War—often two or more on the same temple. These embodied universal themes of the supremacy of the gods and of Greek civilization and law, and the victory and superiority—both military and cultural—of Greeks (specifically, Greek male citizens) over monsters, hybrids, women, and foreigners. But the location, date, deity, and context of a temple also determine the viewer's understanding of its sculpture. These four conflicts on the fifth-century Athenian Parthenon doubtless celebrate victory over the Persians. The Gigantomachy on the Attalid Great Altar in Pergamum, ca. 175, however, commemorates a victory over the Gauls. At the same time, by "quoting" from the figures on the Parthenon, it asserts Pergamene claims to Greek ideals of civilization.

The Persian War marks a distinct break in approach to historical depictions. Scenes showing clashes between Greeks and Persians appear in the early fifth century alongside mythical depictions. The Persian warrior is identified by realistic details such as his *anaxyrides* (trousers), sleeved *chiton*, distinctive cap, curved sword, and *pelte* (crescent-shaped shield). While the pattern of the one-on-one duel is retained, fights against Persians are not fights between equals; rather, the artists depicted a series of Greeks killing their opponents, with an increased level of violence. These are not equal Greek enemies, but a far more unsettling threat that needs to be unequivocally defeated. The Greeks are armed with the thrusting spear or

sword for fighting at close quarters, whereas the favored Persian weapon in these depictions is the bow, contrasting Greek bravery with Persian cowardice, Greek simplicity in dress (or nakedness) with elaborately decorated Persian dress, Greek victory with Persian defeat. The contrast between very elaborate Persian dress and equipment and Greek simplicity is one between effeminacy and hardiness.

A Greek soldier killing a Persian in a scene from one of Alexander the Great's battles (possibly at Gaza) on the "Alexander Sarcophagus." The late-fourth-century sarcophagus, a masterpiece of Greek art, was found in the royal necropolis at Sidon, but is now in the Archaeological Museum in Istanbul, Turkey. (Robert Harding Picture Library Ltd/Alamy Stock Photo)

Although these are still generalized depictions rather than allusions to specific battles, it seems clear that the Greeks occasionally made an

exception and depicted specific events where the Persian Empire was concerned. The most famous instance of this is the painting of the battle of Marathon in the *Stoa Poikile* in Athens (perhaps ca. 460). This seems to have combined a pictorial schema derived from Amazonomachies (one of which was also painted in the *stoa*) with accurately depicted historical details of dress: the viewer would recognize both the immediate context of the Persian invasions and the broader mythical context of enemies who are always defeated. Another step in this direction comes with the Temple of Athena Nike at the end of the fifth century, which appears to depict not only Greeks fighting Persians (possibly the battle of Marathon) but also Greeks fighting Greeks, representing, it has been argued, the contemporary Second Peloponnesian War. Such historical scenes do not replace mythical ones, but add another string to the artist's bow. The degree to which even historical scenes are culturally constructed is made clear by the schema's reversal in the Hellenistic Period. By the time that the Gauls come into focus as the primary opponents, the ideal Greek lifestyle has become less abstemious, and the contrast becomes one between the sophisticated Greeks, defenders of civilization, and the uncultured Gauls, proponents of a very different brand of barbarian threat from the Persians.

In sum, depictions of warfare in Greek art are illuminating in both specifics and as a more general tool for insight into Greek ways of thinking about conflict. The sheer volume of material depicting war and the warrior mirrors war's significance in other sources for Greek culture. These images provide us with invaluable evidence, but they are not snapshots of military realities, and need careful interpretation in their own context and on their own terms.

Artaxerxes I (Reigned 465–424)

Xerxes’ murder, initially blamed on his son Darius and then on a conspiratorial favorite Artabanus (whom Artaxerxes eliminated) left Artaxerxes as king. (His own death in 424 left a disputed succession.) Notable aspects of his reign include Themistocles’ defection (464), an Egyptian rebellion (460–454), the Peace of Callias (of debatable authenticity), Persian interference in Samos (440) and Colophon (before 428), satrapal revolts in Transeuphratene (440s) and Bactria (465/4), the Jerusalem missions of Ezra (458) and Nehemiah (445), and building-work at Persepolis. Nicknamed “Longhand”—perhaps a tribute to the extent of his power—he had a reputation for fair-mindedness.

Artaxerxes II (Reigned 405/4–359/8)

The longest Achaemenid reign produced a new palace at Susa, a remarkable ideological novelty (Artaxerxes' inscriptions named Anahita and Mithra alongside Ahuramazda as special divine patrons), and mixed politico-military fortunes. Artaxerxes defeated his brother Cyrus' insurrection (401) and, by trading support to Sparta (Persia's enemy since 400) for surrender of the Greeks of Asia Minor, recovered full control of western Anatolia in 386—a dispensation intact until Alexander. By contrast, all efforts to recover Egypt, which revolted in ca. 404, were wholly (even embarrassingly) unsuccessful, the Cypriot rebel Evagoras negotiated terms rather than being crushed, and the reign ended amidst bloody court intrigue.

Artaxerxes III (Reigned 358–338)

Artaxerxes became king after the death of three brothers (respectively executed for treason, driven to suicide, and murdered) and consolidated his position by eliminating other members of the royal family. Eventually he himself fell victim to assassination, but the intervening 20 years saw various

successes. Satrapal dissidence in Anatolia was curbed and the prospect of Persian retaliation for an incursion into the Great King's land forced Athens to make peace with its rebellious allies: both achievements reflect threats rather than military action and reveal the fear induced by a new and ruthless ruler. Rebellions in Cyprus and Phoenicia in the early 340s were suppressed with military force, though the fall of Sidon was achieved by a sordid mixture of Sidonian treachery and Persian double-cross.

The reign's crowning achievement was in Egypt. After a failure in 351 (which perhaps helped to prompt the Cypriot and Phoenician revolts), a renewed attack in 343—the seventh attempt since Egypt's rebellion in 404—was successful. A substantial army, drawn from imperial heartlands and Asia Minor, was supplemented by Greek mercenary forces, including some who, with their commander Mentor, had been involved in the treacherous surrender of Sidon to the Persians. When the attackers penetrated the Egyptian defensive line in the Eastern Delta in separate coordinated operations, the pharaoh Nectanebo II retreated to Memphis and then fled to Ethiopia, and further resistance was at best local. As at Sidon, Persian victory was followed by extensive destruction and looting. In Artaxerxes' final years, a perceived Macedonian threat to Persian control of western Anatolia led to Mentor being appointed regional commander and the local satraps supporting Perinthus when it was besieged by Philip II. Artaxerxes was dead before Philip's forces landed in northwest Anatolia and began the process that Alexander would so triumphantly complete.

Artemisia (Active ca. 480)

Artemisia was the local ruler of Halicarnassus, Cos, Nisyra, and Calydna during the reign of King Xerxes and served in his invasion of Greece in 480. She was the daughter of Lygdamis of Halicarnassus and a Cretan. She has a reasonably prominent supporting part in Herodotus' *Histories*, perhaps because of the relative novelty of a female commander but also because Herodotus also came from Halicarnassus. Herodotus portrays Artemisia sympathetically as one of those who provided Xerxes with good quality honest advice that he failed to follow.

Herodotus claims (7.99) that she chose to personally command the five-ship contingent from her territories on the expedition because of her “manly courage.” Prior to the battle of Salamis, she advised Xerxes not to attack but to wait for the Greek fleet opposing him to disintegrate from internal dissension. In the battle, she fought well but at one point came close to capture. To escape she rammed one of her own ships, causing the pursuer to think her ship was either Greek or a defector. From his hilltop vantage point, Xerxes and his staff observed the incident and assumed she had bravely rammed a Greek ship. Herodotus (8.93) notes that the Athenians offered a price for her capture because they were so upset a woman was fighting against them. Artemisia survived the battle and was selected to escort Xerxes' children home.

Artemisium, Battle of (480)

Artemisium is the northwestern promontory of the island of Euboea, opposite Thermopylae, and the site of the first naval battle in the Second Persian War when the Persians tried to force the Greeks' joint land and sea defensive line at Thermopylae and Artemisium. Despite Sparta's lack of naval experience and Athens' contribution of by far the largest number of triremes (127), the Spartan Eurybiades commanded the naval contingent of 271 triremes and 9 penteconters—later reinforced by a further 53 Athenian triremes. The Persian fleet had lost a third of its strength in a storm and now had 800 warships, which anchored at Aphetae on the mainland.

The battle was a scrappy affair, fought in a series of actions of various scale over three days. The Persians started badly, losing 15 ships that on arrival mistook the Greek fleet for their own and tried to join it. They lost a further 30 ships in a skirmish the next day and that night lost to a storm a squadron of 200 sent around Euboea to attack the Greek rear. The Persians mounted a serious attack the following day but despite inflicting considerable casualties, suffered even more themselves and were unable to force the Greeks from Artemisium. This stalemate was only broken when the Persian army took the pass at Thermopylae—if the Persian army could simply march south there was no point in the fleet remaining and it made an orderly withdrawal.

Asclepiodotus (First Century)

Asclepiodotus was the author of a short, 12-chapter treatise transmitted under the heading *Main Points of Tactics of Asclepiodotus, Philosopher*. This work is the earliest surviving specimen of an originally late Hellenistic tradition of Greco-Roman military writing, which aimed to explain the terminology, organization, and tactical evolutions of a hypothetical army, based on a highly schematized infantry phalanx, with supporting light infantry and cavalry. Chariots and elephants are also included, but considered obsolete. The terse style and elementary content suggest a summary or abridgement. In the absence of internal indications of date or authorship, Asclepiodotus is commonly identified with a scientific author of that name, whom Seneca describes as a pupil of the Stoic philosopher Poseidonius of Apamea (ca. 135–51). As Poseidonius reportedly wrote a tactical treatise that has not survived, it is accordingly assumed that Asclepiodotus' text is an adaptation of his teacher's lost work. Later treatises by Aelian and Arrian were derived from the same tradition.

Asia Minor

A term first used around 400 CE to describe the geographic region, also known as Anatolia, comprising most of modern Turkey from the Aegean Sea in the west to the Euphrates River in the east, bounded by the Black Sea to the north, and the Mediterranean to the south. The cultures and peoples of this region have been influenced by their neighbors on all sides, although Asia Minor is popularly seen as the "bridge" between Europe and the Near

East. Greek colonists settled along the Aegean and the Black Sea coasts from 1,000 until 500. Persian influence grew inland to match the spread of the Greeks along the coast, and after the conquests of Alexander the Great, Asia Minor was fought over during the wars of the *diadochoi* (Successors) who strove to control the region's lucrative resources and wealth. By the second century, the region was home to the Attalid dynasty based in Pergamum and the Mithridatids in Pontus. By 63, all the kingdoms of Asia Minor had become Roman provinces.

Assassination

Assassination (there is no corresponding ancient Greek term) may be defined as the disruption of the normal political process by the deliberate killing of a specific opponent or opponents for political ends. This happened once under the democracy in Athens in a bitter but otherwise nonviolent political dispute: in 461 the popular leader Ephialtes was assassinated. This assassination did not stop the passing or the consolidation of the reforms Ephialtes proposed and may have been no more than revenge arising out of frustration.

Some assassinations that occurred in Athens in 411 were rather different, as they occurred when the constitution was being subverted. Conspirators in the Athenian fleet stationed at Samos, working for the oligarchic faction in Athens, assassinated the Athenian demagogue Hyperbolus, then living on Samos during his period of ostracism (Thucydides 8.73). This killing was apparently intended to commit the conspirators to carrying out their plans: there could be no turning back after

so heinous a crime. The same applies to the killing in the same year of the demagogue Androcles in Athens (Thucydides 8.65). The oligarchs also carried out a systematic program of killing outspoken opponents of their movement and the state's organs of justice were helpless against such violent intimidation. However, the assassination of Phrynichus, one of the leaders of the Four Hundred, was a sign that opposition to the oligarchy was growing (Thucydides 8.92).

Political conflict in other Greek states could be far more savage than in the relatively stable Athenian democracy. Assassination was the obvious resort of those aiming at regime change. Thus oligarchic conspirators in Elis ca. 398 aimed to kill the democratic leader Thrasydaeus but got the wrong man, who happened to resemble him (Xenophon, *Hellenica* 3.3.27). A more spectacular example was the carefully contrived killing of the leading Theban oligarchs in winter 379/8 by a group of democratic exiles who were brought into their opponents' drinking party disguised as respectable married women being prostituted to the oligarchs (Xenophon, *Hellenica* 5.4.2–7). Less colorful, and far more brutal, was the mass murder in Corinth in ca. 392 on the day of a religious festival. This was a concerted attack in public places, such as the *agora* and the theater, by supporters of a democratic union with Argos against a large number of opponents. Taking refuge at an altar was no protection for some victims (Xenophon, *Hellenica* 4.4.2–3).

Such large-scale acts of indiscriminate killing, such as the notorious incident in Corcyra in 427 (Thucydides 3.69–85, see Document 9), may be better classed as massacre rather than assassination. Assassination, defined as an act directed against an individual, is most commonly seen in Greek history in the form of tyrannicide: the killing of an individual who could be regarded as having put himself outside the law by his illegal assumption of one-man rule. Assassination was the common fear of all tyrants: Dionysius I of Syracuse was legendary for the elaborate precautions he took to avoid it, although such a story as having his daughters shave him because he did not trust barbers is probably exaggerated.

Those who succeeded in assassinating a tyrant could be assured of high honors, such as were awarded in many cities of Greece outside of Thessaly to the young men who survived their successful assassination of Jason tyrant of Thessaly in 370 (Xenophon, *Hellenica* 6.4.32). Of Jason's relatives who followed him in the tyranny, all except one died at the hands of other

family members. A list of the tyrants and monarchs whose lives were ended by assassination would be a long one: the Macedonian royal house alone can contribute Alexander I, Archelaus, Amyntas II, Pausanias, Alexander II, Perdiccas III, and Philip II. It was only natural that many contemporaries believed that Alexander the Great had been poisoned.

The assassins of Phrynichus in Athens in 411 (see above) were liberally rewarded, but there was much legal wrangling over who actually deserved the credit. The descendants of Harmodius and Aristogeiton enjoyed hereditary honors at Athens, even though their ancestors had assassinated only Hipparchus, brother of the tyrant Hippias who was their intended victim (514/13). Even so, Athenian sentiment made them into heroic liberators. A series of Athenian laws, including one attributed to Solon, made the assassination of a tyrant at Athens justifiable homicide, adding the promise of rewards and in effect laying such an act as a positive duty on any right-thinking Athenian. This provision was reinforced in a law of 337/6 directed against any subversion by the Areopagus.

Some exiles from Sicyon assassinated Euphron the tyrant of Sicyon when he was about to address the Council on the Cadmea at Thebes (ca. 365). They were immediately indicted for murder and sacrilege (the Cadmea included much sacred space). All except one denied they had done it, but one man pleaded that such an act was justifiable on legal and moral grounds. Xenophon reported both the speech by prosecution and this man's defense (he was acquitted), because of the perennial interest for Greeks of this matter of assassination as justifiable homicide (*Hellenica* 7.3.4–12).

Astyochus (Active 412/11)

Astyochus, a Spartiate, was *nauarchos* (admiral) of the Spartan fleet

appointed in the summer of 412, active in the Aegean Sea during the Ionian War phase of the Peloponnesian War. His activities began after the Spartan's first treaty with the Persian Empire and a bloody democratic revolt at Samos, and during attempts by Alcibiades and the Peloponnesians to draw Ionian cities away from Athens' empire. Winter 412/11 saw Astyochus in ineffective actions at Pteleum, Clazomenae, and Lesbos. He was accused of wrongdoing for refusing to assist the Chians against Athenian forces: the Spartan government sent a board of official commissioners with the power to replace him. Ordered to execute Alcibiades, he failed in this and became involved in epistolary machinations between Alcibiades, the Persian commander Tissaphernes, and the Athenian democrat Phrynichus. In summer 411, Tissaphernes' refusal to pay Sparta's allies well, and Astyochus' insistence on waiting for a phantom Phoenician fleet, caused the Peloponnesian-allied fleet to remain inactive. This led frustrated Syracusan and Thurian sailors at Miletus to demand pay from Astyochus. He threatened them, and they almost lynched him. Mindarus succeeded him as *nauarchos*. Astyochus' lack of intelligent resolve seems fairly typical of Spartan lack of will and vision before Lysander to earnestly undertake an overseas administration.

Athenian Confederacy, Second

The Second Athenian Confederacy (or League) was a maritime alliance formed by Athens in 378/7 and abolished only at the formation of Philip II of Macedon's League of Corinth 40 years later. The League's founding charter, the Aristoteles Decree, contains a series of commitments on the part

of Athens to other member-states: a central decision-making body, no interference in allied constitutions, and no cleruchies or tribute. Evaluation of the League has depended to a great extent on whether Athens is seen as having failed to honor these commitments.

The explicit purpose of the League at its foundation was to combat the influence of Sparta, still the major Greek power after the Peloponnesian and Corinthian Wars. More specifically, the League endeavored to preserve the autonomy of the *poleis* that had been mandated in the King's Peace of 387 (although it might have been unclear to many outside the Athenian sphere of influence why the League did not itself violate that autonomy). After the crushing victory of Thebes at Leuctra in 371, the Spartan threat receded, but the League continued to exist, defending Athenian and allied interests against not only Thebes, but also the rising power of Macedon. The revolts of Rhodes, Chios, and Byzantium led to the so-called Social War (from Latin *socii*, allies) in 357–355; but the final dissolution of the League would have to wait until after Philip's decisive defeat of Athens and Thebes at Chaeronea in 338.

Although the League was never as powerful or as large as its predecessor, the Athenian Empire (the League had around 60 members, compared with the Empire's 100 to 200 members), many observers have seen in the history of the fourth-century League an eventual reversion to the imperial habits of the fifth-century Empire. In most cases, however, though it is hard to deny that Athens sometimes acted against the spirit of the promises it made in the Decree of Aristoteles, it is also difficult to assert that it broke the letter of its commitments. Though the fifth-century word for tribute, *phoros*, was never used in the fourth, contributions were solicited, and granted, under a new label, *syntaxis*. Though cleruchies were imposed on Samos and Potidaea in the late 360s, neither of these states were members of the League. And though the campaigns of Athenian generals such as Timotheus, Chabrias, and (especially) Chares may well have had an impact on the political alignment of Aegean *poleis*, there is no clear evidence that Athens directly violated the autonomy of allied states. Whatever limitations membership in the Second Athenian League imposed on its member-states, the eclipse of the alliance by the Macedonian-led League of Corinth was soon to usher in a new world in which the independence of small *poleis* in the Aegean was to be ever more precarious.

Athens

After relatively humble beginnings, Athens rose to be one of the dominant military forces of the Classical Greek world, before being eclipsed by larger polities such as Macedon and Rome. A regional power by the late Archaic Period, and a force to be reckoned with soon after its transition to democracy in 508/7, the city was an indispensable member of the Greek alliance in the Persian Wars, a position that soon morphed into leadership of the anti-Persian Delian League. The League, in turn, morphed into an Athenian Empire, making conflict with Sparta inevitable; two Peloponnesian Wars ended with Athens' surrender in 404. It soon recovered, holding its own against both Sparta and Thebes for much of the fourth century, but Athens was unable to deal successfully with the rising threat of Philip II of Macedon. After defeat at Chaeronea in 338, the city was condemned to watch passively as the conquests of Alexander resulted in an explosion of Macedonian power. A revolt against the new order was crushed in the Lamian War (323–322), after which the democracy was dismantled. A few more short-lived uprisings followed, but by the late third century Athens was content to withdraw from the entanglements of international conflict, and during the Roman period the city proved on several occasions to be vulnerable to assailants. During its classical ascendancy, Athens' power was mainly a function of its large navy, although its citizen army could also be a considerable force, and a series of fortifications helped secure home territory. Explanations for Athens' rise to military preeminence in the fifth century, and for its later decline, vary, but both geographical and political factors seem to have played some role.

Settled in prehistoric times, Athens was a moderately important

Mycenaean center; so much is suggested by fourteenth-century tombs and by fortifications on the Acropolis dated to the following century. After the Bronze Age collapse, Athens was *synoikized* (united as a *polis*) probably sometime in the ninth or eighth century, when settlement seems to have expanded into the Attic countryside. The earliest datable episode in Athenian history, Cylon's attempted coup in 632, is also the earliest datable episode in Athenian military history: Thucydides tells us (1.126) that after Cylon had seized the Acropolis with Megarian troops, "the Athenians came together *en masse* from the fields to resist them and settled down to lay siege," though they later grew tired of the siege and handed over operations to the city's governing board of nine archons. Athens in this early period was a regional power, but by no means a dominant one; it had difficulty asserting control over the nearby island of Salamis against local rivals Megara and Aegina. In the sixth century, Peisistratus (who had distinguished himself in fighting against Megara) finally succeeded in establishing himself as tyrant after three attempts; his final attempt climaxed in the victory of his force (composed largely of Argive mercenaries) at Pallene ca. 546/5. The increase in state capacity associated with Peisistratid rule allowed Athens to tighten its grip on Salamis and even to make its presence felt in the Cyclades.

The Athenian acropolis today, dominated by the remains of the Parthenon, a temple dedicated to Athena. Fortified early in Athenian history, the Acropolis was captured and its buildings were demolished by the Persians in 480. Forty years later, Pericles initiated a major building program, using funds drawn from the Athenian Empire, to

build new temples of great beauty to adorn the religious heart of Athens. (Pedre/[iStockphoto.com](https://www.iStockphoto.com))

But Athens' military capacities were about to be transformed. In 508/7, the Athenians again rose up *en masse* and besieged the Acropolis, this time to expel the reactionary politician Isagoras, who had occupied it with the support of Spartan troops. Isagoras had intended to block the reforms of his rival Cleisthenes; after the Athenian Revolution that ensued, Cleisthenes was given a free hand to redesign the political system. Cleisthenes' reforms also had a military component, providing for a national citizen army with units drawn from each of the 10 new *phylai* or tribes and commanded by 10 generals (*strategoï*) elected by the tribesmen. This new system was immediately put to the test when in 506 armies from Sparta, Chalcis, and Boeotia converged on Athens. After the Spartans turned back, Athens defeated both the Boeotians and the Chalcidians, a victory that led Herodotus to speculate (5.78) that it was the new democracy that had made the Athenians "preeminent by some distance" in war.

But a greater test was on the horizon. After Athens supported the Ionian Revolt in the 490s, the Persian king Darius dispatched a punitive expedition. In 490, the Athenians, probably with around 10,000 men to the Persians' 30,000, won a famous victory at Marathon, one that many later citizens would look back on as their finest hour. In the Greek resistance to the subsequent invasion of Xerxes, Athens played a leading role, even though formal leadership was given to Sparta: at the crucial battle of Salamis in 480, the Athenian fleet was arguably the decisive factor that tilted the balance in favor of a Greek victory. Herodotus, writing half a century later, could not suppress his by then unpopular conviction that the Athenians had been the "saviors of Greece" (7.139).

The prestige that Athens enjoyed as a result of its performance in the Persian Wars made it the natural choice to take over the leadership of the alliance after the Spartan Pausanias had alienated the Ionian member-states. The alliance—now called the Delian League—immediately took aggressive measures to clear Persian influence from the eastern Mediterranean, an endeavor whose zenith was the victory at Eurymedon in 467/6, and whose nadir was reached in 454, with the destruction of the allied fleet in Egypt. By that year—the year that the League treasury was moved to Athens itself—it was the conviction of many observers that the alliance had become an

Athenian Empire, an impression that was fortified by the city's crushing responses to attempted defections. The first revolt was that of Naxos in 470; the most difficult to repress perhaps that of Samos in 441. The obvious and continuing increase in Athenian power led to conflict with Sparta in the First Peloponnesian War from around 460/59; a Thirty Years' Peace in 446/5 left the Empire intact. But Spartan fears continued to grow alongside Athens' influence, and in 431 the Second Peloponnesian War erupted.

The war began well for the Athenians, with the Spartans under their king Archidamus unable to provoke a decisive hoplite battle, and with the superior Athenian fleet winning a series of easy victories such as Naupactus (429). This was in accordance with Pericles' strategic vision, which recommended avoidance of infantry engagements along with sporadic naval raids of the Peloponnese. One such raid in 425 resulted in the Athenian victory at Pylos and Sphacteria, but the ensuing campaigns of Brasidas in the north resulted in a number of Spartan victories, including the capture of Amphipolis. An Athenian bid to recapture the city resulted in the deaths of both Brasidas and Cleon in 422, after which the way was open for the Peace of Nicias of the following year. The signing of the peace did not prevent a mixed force (mainly of Athenians and Argives) challenging Sparta at Mantinea at 418 (the result confirming Spartan preeminence in hoplite warfare); nor did it prevent the launching of the enormously ambitious Athenian expedition to Sicily in 415. After some initial successes, the Athenians failed in their attempts to build an encircling wall around Syracuse, the largest city in Sicily, and were subsequently defeated at sea in the city's great harbor in 413. Despite these apparently devastating losses, Athens recovered, winning improbable victories at Cynossema in 411, Cyzicus a year later, and Arginusae in 406. Lysander's victory at Aegospotami the following year prevented Athens from either collecting tribute or securing the grain-route from the Black Sea. The city finally surrendered in 404.

The settlement imposed by Sparta mandated the dissolution of both Athens' empire and its fleet. Despite this, by the end of the first few decades of the fourth century, Athens was resurgent both as a naval and as a diplomatic power. Naval superiority was reasserted (thanks partly to Persian funding) at Cnidus in 394; the battle was part of the anti-Spartan Corinthian War (395–387/6). After the (Persian) King's Peace in 387/6 left Sparta in possession of considerable privileges, Athens was allowed to form the

Second Athenian Confederacy in 378/7. This led to further victories at sea in the 370s (Naxos and Alyzia). Thebes' victory at Leuctra in 371 severely diminished the Spartan threat, but by 357–355, Athens had its hands full in the Social War (a war with allied members of the Confederacy). Athenian involvement in the Sacred War in the late 350s and in a number of engagements with Macedonian forces in the early 340s only hastened the rise of Philip II; Philip's victory over a joint Theban and Athenian army at Chaeronea in 338 marked the end of Athens as a military power of the first rank.

It did not, of course, mark the end of Athens as a *polis*, though the conquests of Philip's son Alexander in the east were ushering in a new world dominated by large territorial states. In the wake of Alexander's death, Athens rebelled against the new order in the Lamian War (323–322); after some initial successes it was defeated at sea at Amorgos and on land at Crannon, both in 322. The Macedonian regent Antipater put an end to the classical democracy, but democracy of a sort was restored in 318, though later in the same year Cassander (Antipater's son) was able to install the tyrant-philosopher Demetrius of Phalerum. Democracy of a sort was again restored in 307 but Cassander was again able to install a regent, the tyrant Lachares, in 300. After Cassander's death in 297, Athens continued to be dominated by Macedon, now ruled by Demetrius I Poliorcetes; an attempt to escape this domination in the Chremonidean War (from 267/6) ended in failure five years later. Athens was "free" again by 229, after which it pursued the policy of nonengagement recommended by the politicians Eurycleides and Micion.

This policy of nonengagement coincided with the rise of the monopolistic power of Rome. Athens was formally allied with Rome from around 200, and Roman protection allowed the city to flourish economically. But an uncharacteristic decision under the tyrant Aristion to align itself with the anti-Roman war of Mithridates of Pontus led to Athens being sacked by Sulla in 86. Though the city recovered its economic and cultural vibrancy, it had long ceased to be a military power; further sackings by the Herulians (267 CE) and by the Goths (396 CE) only accelerated a decline that would prove terminal (at least until the modern period).

In its Classical heyday, Athens' military strength depended mainly on its navy. The presence of Athenian triremes was the decisive consideration at Salamis and Eurymedon; the loss of triremes was what made the defeats

in Egypt and Sicily so devastating. Athenian hoplites were never as feared as Spartiates, but could hold their own, and occasionally distinguished themselves (as at Marathon and Mycale). A cavalry force drawn from wealthier citizens often struggled to make its presence felt. The territory of Athens was defended by a circuit wall and the Long Walls that linked the city to its harbor at Piraeus; these Classical fortifications were the brainchild of Themistocles. A system of border forts was defended by a force of *ephebes* or cadets on compulsory military service.

Any explanation for the military prowess of Classical Athens should start with natural endowments, including a strategic position affording easy access both to central Greece and to the Aegean; an exceptionally large citizen population (up to 60,000 in the fifth century); and an exceptionally large territory (around 2,400 square kilometers) protected by mountains. This territory also encompassed the abundant silver deposits at Laurium, and it was the discovery of a particularly rich vein of silver there that enabled the construction of the fleet that proved decisive in the Persian Wars. At the same time, the decision to spend the money on triremes was made only after Themistocles had persuaded the Assembly of the wisdom of this course of action; so we should perhaps not rule out a role for Athens' political system. Though Athens' strength was in the fifth century clearly linked to its Empire in some way, the city's military performance was already impressive before the formation of the Empire, and it continued to be formidable long after the Empire had been broken up. Historians are unsure about the relationship between the political involvement of the lower classes and their military participation: was Athens democratic because it had a powerful navy that employed lower-class rowers, or did it have a powerful navy because the lower classes were happy to serve at sea on its behalf? Whatever the truth is, it would seem clear that Athens' democratic system at least allowed it to mobilize considerable numbers of citizens in the defense of its interests for nearly 200 years. In the end, the city's power declined not because it was out-competed by other *poleis* with superior constitutions, but because it was unable to match the manpower and resources of the much larger states that emerged in the Hellenistic and Roman Periods.

Athens, Alliance with Plataea (ca. 519)

The Plataeans requested this alliance to counter pressure from Thebes. Herodotus (6.108) records that (ca. 519) the Plataeans asked Cleomenes I (who was in the region with an army) for protection, offering in return to make themselves subject to Sparta. Noting that Sparta was too far away to offer timely aid, Cleomenes suggested that Athens would make a better protector. Herodotus adds the comment, no doubt extrapolated from later events, that Cleomenes did so to ensure that Athens and Thebes were hostile to each other. The Plataeans gave themselves over to Athens for protection. The Athenians forcibly extended Plataean territory up to the River Asopus, moving the boundary between Plataea and Thebes recently arbitrated by Corinth. The alliance also resulted in the Plataeans serving alongside Athens at Marathon (490) and remaining loyal to the Greek cause in the Second Persian War, but did not prevent Plataea's destruction by Thebes during the Second Peloponnesian War.

Athens, Campaigns in Thrace

Athens developed a marked interest in Thrace, the territory to the north and northeast of the Aegean, in the mid-sixth century. Thrace thereafter figured prominently in Athenian foreign policy and military activity until at least 338. Particularly in the vicinity of the Strymon River in the north Aegean, Thrace was very rich in gold and other precious metals and afforded an abundance of timber, enriching Athens and many of its leading figures, as well as providing the raw materials to build and finance the ships of Athens' fifth-century navy. In addition to regions providing natural resources, the Thracian Chersonese, today's Gallipoli Peninsula in Turkey, lay on the northern shore of the Hellespont, or Dardanelles, and therefore was strategically located along the vital shipping route between the Aegean and Black Sea. The Chersonese itself abounded in arable land, rendering it a prime location for Athenian settlements, or *cleruchies*. All these factors ensured that Athens would focus much of its military energies on acquiring and defending access to and territory in Thrace.

The first major Athenian campaign in Thrace took place in the 550s, when Miltiades I led an expedition of Athenians to settle the Chersonese at the invitation of a local Thracian tribe, the Dolonci. Miltiades drove out the enemies of the Dolonci, and ruled the territory as a tyrant until his death, about 525. Control of the area remained in his family's hands, passing eventually to his nephew, Miltiades II, who conducted many further campaigns before returning to Athens in 493. The Athenian Empire of the fifth century had much territory in Thrace. In 476/5, Cimon, son of Miltiades II, led an expedition to Eion, on the mouth of the Strymon, where he drove out the Persians and then handed the fertile territory over to Athens. Cimon also put down an anti-Athenian revolt on Thasos, an island lying off the Thracian coast, in 463/2. In 437/6, Hagnon established the city of

Amphipolis on the Strymon, after several previous failed Athenian attempts to gain a foothold in the region. Athenian interest in Thrace was a major factor in the Second Peloponnesian War. Athens sent generals to cooperate with the Thracian king Sitalces in 429/8, lost Amphipolis to the Spartans in 424, and failed to retake the city in 422. The Spartans decisively defeated the Athenians in 405 at Aegospotami, in the Chersonese, after several years of Athens trying to maintain its possessions in the region. In the fourth century, Athens attempted to protect its interests in Thrace, forming alliances with several Thracian rulers, sending Iphicrates on an unsuccessful mission to retake Amphipolis in the 360s, and continuing to send expeditions to the Chersonese and other areas. Athens eventually lost its influence in Thrace to the expanding power of Philip of Macedon.

Athens, Expedition to Cyprus (450–449)

The Athenian expedition to clear the Persians from Cyprus in 450–449 was one of several in the fifth century demonstrating continuing Athenian interest in the island. In 478, the Hellenic League fleet had freed a large part of Cyprus from Persia, and in 460 a 200-strong fleet headed for Cyprus was diverted to Egypt to take advantage of Inaros' revolt there. Probably in 450 (although some historians, Meiggs for example, have argued for 451) Cimon, recently returned from exile, led a 200-strong fleet to Cyprus. The details of the expedition are difficult to recover—Thucydides', Plutarch's, and Diodorus' accounts have irreconcilable differences. The most plausible reconstruction of events is that Cimon captured Marium and raided Phoenicia in the first year of the campaign. In the second, he died (probably

of illness) while besieging Citium—either just before or just after a major victory over the Persians on land and sea that resulted in the capture of 100 Persian ships.

There were sound strategic reasons for Athens' interest in a friendly, or Athenian dominated Cyprus. This would provide a check on the resurgence of Persian naval power and give Athens a firm base in the eastern Mediterranean to assist their influence over the Greek cities of Asia Minor and also Egypt. The earlier expeditions suggest this was an ongoing Athenian interest after the Second Persian War (480–479).

Athens, External Conflicts (519–506)

In 519, under the Peisistratidae, the Athenian alliance with Plataea caused war with Thebes. The resultant Athenian victory brought both Plataea and Hysiae under Athenian control. In 516, Miltiades II extended Athenian rule in the Thracian Chersonese and seized Lemnos. However, many of the settlers returned home when the Persians advanced in the area (514–513), and the Chersonese was abandoned in 511. The same year, the Spartan and the Peloponnesian League attack on Athens that overthrew the Peisistratidae was precipitated by internal Athenian conflict.

The exiled Alcmaeonid, Cleisthenes, was claimed to have bribed the Delphic oracle to persuade the Spartans to expel the Peisistratidae. In 511/10, taking advantage of internal unrest, the Spartans attacked. Their surprise landing at Phalerum was defeated by the Peisistratidae with Thessalian help. A second attack, under Cleomenes I, supported by Athenian opponents of the tyranny, trapped the Peisistratids on the Acropolis. They surrendered (510) when their sons were captured.

Defeated in the political struggle that followed, Cleisthenes' opponent, Isagoras, called in Cleomenes and the Spartans again occupied Athens. But Cleomenes had misjudged—the Athenians attacked and penned his small

force up in the Acropolis. Cleomenes withdrew under a safe conduct and Cleisthenes enacted fundamental changes to the Athenian constitution.

In 506, Cleomenes led a Peloponnesian League army against Attica, coordinated with a landing by forces from Chalcis (Euboea) in northeast Attica, and a Boeotian attack that seized Oenoe and Hysiae. Cleomenes reached Eleusis but when the Athenian army deployed to meet them, his allies and his fellow king, Demaratus, refused to fight and the army retired. The Athenians then defeated the Boeotians and, crossing to Chalcis, defeated it and settled 4,000 cleruchs, or military settlers in its territory. These stunning victories cemented Cleisthenes' constitution, boosted Athenian confidence and established it as a major power in Greece.

Athens, Intervention in Egypt (460–454)

The Athenian expedition to Egypt in 460–454 was part of Athens' aim to extend its influence in the eastern Mediterranean. The fleet was originally bound for Cyprus and diverted to capitalize on Inaros' revolt in Egypt. The 200-ship Athenian fleet (including perhaps 100 allied ships from the Delian League) eliminated the Persian naval presence in the Nile. Memphis was captured—except for its citadel, the White Tower. Continuing military action occurred over the next few years, although the first Persian counter-offensive was diplomatic.

Megabazus went to Sparta in an unsuccessful attempt to bribe the Spartans to invade Attica and cause an Athenian withdrawal from Egypt. In 455, a large Persian navy and army under Megabazus arrived in Egypt, defeated the rebel army, relieved Memphis, and trapped the Greek fleet at

the island of Prosopitis. In summer 454, the Persians diverted the water around Prosopitis and took it by land.

The extent of the defeat has been the subject of debate. Thucydides clearly suggests that the defeat was major, with almost the entire expedition lost—including a relief force of 50 ships surprised on arrival just after Prosopitis fell. However, Diodorus states that the Athenians withdrew under truce. Modern historians have argued that the loss of 200 triremes and crew would have crippled Athens for some time, but Athens was clearly able to field large fleets in the years following the defeat. However, if half the fleet was allied and not Athenian, and the loss was not complete, this would not necessarily have been crippling. In any event, the losses were apparently serious enough to encourage Athens to look to a negotiated end to the First Peloponnesian War.

Athens, Naval War with Sparta (376–374)

In 376, Athens and its main ally, the Boeotian state centered on Thebes, were in the third year of a war with Sparta. Spartan invasions of Boeotia by land in 378–377 had devastated some territory but had not had any decisive outcome. In 376, an invasion had even failed to force the pass over Mount Cithaeron. Frustrated by this lack of progress, a conference of Sparta's allies later in the year decided to send out a fleet. Their plan was to repeat the strategy that had won the Peloponnesian War by preventing cargo-ships bringing to Athens the imported grain it needed to feed its population.

At first a fleet of 60 triremes sent out under the Spartan navarch (naval commander), Pollis, took command of the sea to the south and east of Attica

and prevented ships from bringing grain into Piraeus. To deal with the severe food-shortage, Athens sent out under Chabrias a fleet of 60 (Xenophon) or 83 triremes (Diodorus), its first big naval mobilization since the end of the Corinthian War (387/6). It is not known what contribution the new alliance Athens had formed, the Second Athenian Confederacy, made to this fleet. The Confederacy must have contributed and the difference between the numbers of triremes given by Xenophon and Diodorus above may represent the allies' contribution.

The two fleets soon met off the island of Naxos and Chabrias was victorious. For the loss of 18 Athenian ships, he may have taken or sunk as many as 49 of the Spartan fleet. The blockade of Piraeus was over.

In the following year, Athens sent a fleet of 60 ships under Timotheus around the Peloponnese, at the request of Boeotia, to prevent Sparta transporting troops across the Corinthian Gulf into Boeotia. Timotheus was able to take the opportunity to sail to Corcyra, which now joined the Second Athenian Confederacy. Sparta sent out a fleet under the navarch Nicolochus to counter Athens' growing power in this region. Nicolochus engaged the Athenian fleet with 55 of his triremes off Alyzia in Leucas and was defeated.

Although Nicolochus set up a trophy of his own to challenge Timotheus' right to claim the victory, he could not prevent Timotheus from winning over more allies in the region. The cost of maintaining these fleets was a heavy strain on both Athens and Sparta. Together with Boeotian gains at home, this made both Athens and Sparta ready to accept a proposal for peace sent in a letter from the king of Persia, Artaxerxes II. The resulting Peace of 375/4 was a renewal of the King's Peace of 387/6 but the growth of Athenian power through the extension of the Second Athenian Confederacy put Athens on a more equal level with Sparta. This Peace was regarded as effectively recognizing Athens' naval supremacy.

Athens, Oligarchic Movements

During the almost 200 years of its existence (508–322), the Classical Athenian democracy was successfully overthrown only twice.

The Four Hundred and the Five Thousand

The destruction of the Sicilian Expedition in 413 and the widespread defection of allies that followed convinced many elite Athenians that a change of government was in order. The move was prepared for in the political clubs and executed in 411, at an extraordinary meeting of the Assembly that took place while the fleet was away at Samos—along with a good number of lower class Athenians. The narrow government that resulted, championed by the likes of Peisander, consisted of 400 elite citizens; but this soon gave way to the slightly broader regime of the Five Thousand, a constitution associated with Theramenes. This, too, was short-lived, and by the following year the radical democracy had been restored.

The Thirty Tyrants

After the Athenian surrender at the end of the Second Peloponnesian War in 404, the Spartans under Lysander installed a group of upper class Athenians who would become known as the Thirty Tyrants. Eventually they were buttressed by a Spartan governor, Callibius, and a force of 700 Spartans; in spite of this, the regime would last only eight months. Democrats in exile, led by Thrasybulus, established a foothold in Phyle before moving down to the Piraeus, where they were met by an oligarchic force. This force was defeated, its leader Critias was killed, and democracy was restored once again.

Athens, Restoration of Democracy (403)

The Athenian democracy was overthrown with Spartan assistance at the end of the Second Peloponnesian War (431–404). The resulting narrow oligarchy, the “Thirty Tyrants,” propped up by a Spartan garrison, ruled Athens with considerable brutality for around eight months. In 403, democracy was restored after what was essentially a civil war between oligarchs and democrats.

The Thirty Tyrants drew their internal support from members of the Athenian upper classes, who considered that they had unfairly carried the Athenian war effort in the last few years of the war—both financially and physically (through hoplite and cavalry service in defense of the city itself). It seems that a significant number of the 1,000 strong Athenian *hippeis* (cavalry) were either involved in the coup or supported it. The Thirty quelled opposition through threats, arrests, and executions, including that of Theramenes (Document 13).

The military aspect of the conflict began when Thebes, which had fallen out with its ally Sparta, helped Thrasybulus and a band of 70 exiles occupy Phyle, a border fort in the mountains between Attica and Boeotia. The Spartan garrison and the Athenian cavalry attempted to drive Thrasybulus’ men out, but lost 123 men in a dawn attack on their camp. Rapidly losing their support, the Thirty had the cavalry create a refuge by expelling the inhabitants of Eleusis and killing the adult males. Late in 404, they retired there when defeated at Munychia by Thrasybulus. This battle is interesting because the Thirty’s phalanx was 50-deep while the democrats’ phalanx was only 10-deep but with slingers and javelin-equipped troops behind it. Their missiles, thrown downhill over their own troops, helped break up the enemy but Xenophon notes that before the battle started the seer with the democrats, who had told them they would win if they did not attack until one of their own was killed or wounded, leapt forward, and fulfilled his own prophecy. Two of the Thirty (Critias and Hippomachus) were killed.

The following year disagreement between King Pausanias and Lysander and a near loss of the garrison caused the Spartans to force a reconciliation between the oligarchs and democrats and withdraw. By 401, the process of restoration was complete, with the oligarchs exiled, dead, or reconciled with their fellow citizens under an amnesty. Despite this, resentment against the cavalry lingered for some years.

Athens, Revolts of Allies (Fifth Century)

Revolts of allies are attested for the duration of the Delian League and the subsequent Athenian Empire. The first revolt (that of Naxos in 470) took place less than a decade after the formation of the league, and the final dissolution of the empire by the Spartans in 404 was preceded by widespread defections in the wake of the Athenian defeat at Aegospotami the previous year. In the intervening period, Athens was mostly successful in suppressing revolts, although its ability to do so varied a great deal depending on the state of its navy, as well as on other factors, such as the level of support available to allies from rivals such as Sparta. The motivations behind allied revolts also varied, and are sometimes impossible to recover, but seem to have included dislike of various imperial measures, disinclination to pay tribute, and political transitions within allied states.

The chronology of the fifth-century Athenian Empire continues to be controversial, but any narrative of the allied revolts has to begin with that of Naxos, probably in 470. The allied victory over the Persians at Eurymedon the following year may have given some allies the impression

that contributions to the league were no longer necessary; if so, they were quickly disabused of this notion by the suppression of Thasos in 463/2 (two years after the initial uprising). The destruction of much of the allied fleet in Egypt in 454 may have been a factor in the revolt of Erythrae and Miletus in the same year; they were successfully returned to the alliance the following year. In 446, Pericles succeeded in the reduction of Euboea and Megara, which had revolted from Athens earlier that year. Athens' intervention on the side of Miletus in a war with Samos, and the subsequent imposition of democracy on the Samians, led to a full-scale revolt of the island (soon joined by Byzantium) in 441; despite stubborn resistance, both cities had been forced back into the Empire by 439. The origins of the Second Peloponnesian War lie partly in the revolt of Potidaea in 432 (a year in which Chalcis also revolted), though the city was eventually recovered, at huge expense, two years later. But there was little respite for Athens, which was forced to deal with an uprising in Mytilene from 428 to 427. The disastrous defeat of the Sicilian Expedition in 413 was followed by widespread revolts in Ionia and in Euboea; though financial contributions (now in the form of a 5% tax) were restored for a final time in 410, Lysander's victory at Aegospotami in 405 led in swift succession to the defection of most of Athens' remaining allies and to Athens' surrender, after which the Empire was disbanded by Sparta.

For most of the fifth century, Athens was successful in restoring rebellious allies to the Empire. The ability of these allies to resist was limited, mainly because most of them had chosen early on to make contributions to the alliance in the form of silver tribute rather than ships. Rebellions by the few allies, such as Samos, that retained their own navies, were accordingly significantly harder for Athens to repress. The state of Athens' own navy was of course a key determinant in Athens' ability to deal with rebellions; the final phase of the Second Peloponnesian War (the Decelean War, 413–404), defined by Athens' struggle to hold on to its Aegean allies, was ushered in by the catastrophic loss of ships in Sicily.

The causes of allied rebellions are not always known, but seem to have varied. Since rebellion was usually signaled by a failure to pay tribute, we can speculate that simple disinclination (or inability) to pay the amount assessed was sometimes a factor. Discontent with various measures taken by what some regarded as a "tyrant *polis*" (to use the phrase attributed to the Corinthians by Thucydides 1.122) will also have played a role in many

cases. Such measures may have included the so-called Standards Decree of around 414, which mandated the use of Athenian weights, measures, and coins by member-states of the Empire; the Decrees of Cleinias and Cleonymus, from around 426, which provide for the appointment of tribute-collectors in allied cities; and the Reassessment Decree of 425, in which Athens aggressively increased the level and scope of its financial demands on Aegean *poleis*. (Many of the decrees from this period that have survived in the form of inscriptions on stone have recently been re-dated from the middle of the century to the time of the Second Peloponnesian War.) A continuing source of grievance from mid-century was the apportionment of cleruchies, that is, pieces of land in allied states that were directly expropriated and handed over to Athenian settlers.

Some revolts occurred soon after events that may have suggested that the Delian League had either fulfilled its purpose, or had hardened into an Empire: the Thasian uprising a few years after Eurymedon may supply an example of the former case (though economic factors were also operative there), and the revolts of Erythrae and Miletus after 454 of the latter. The year 454, though, was not only the date of the removal of the League treasury to Athens, but also of the decimation of the allied fleet in Egypt; so we cannot rule out the influence of simple opportunism. Allied judgment of the ability of Athens to respond effectively to uprisings was certainly a central variable of the Decelean War. Many revolts came into being because of political struggles within allied states: Mytilene in 428 revolted as an oligarchy and surrendered after a democratic revolution. In the end, however, whatever ideological attractions democracy may have had for citizens of allied states, the Empire's survival was dependent mainly on the military balance of power between Athens and Sparta. One of the aims of Brasidas' campaigns in the north in the 420s was to detach states such as Amphipolis from the Athenian alliance; and in many cases he succeeded, at least for a time. After Lysander's victory at Aegospotami in 405, the Empire fell apart; and Athens' surrender the following year confirmed that it would not be put together again, at least not until the Second Athenian Confederacy was formed in 378/7.

Athens, War with Aegina (ca. 500–458)

Causes

The Athenian war against Aegina pitted two perennial ancient naval superpowers in a conflict that spanned much of the first half of the fifth century. According to Herodotus, enmity between Athens and Aegina was long standing, and an Athenian expedition to recover a stolen statue had met with disastrous results when all but one member of the crew perished.

Course

At the end of the sixth century (ca. 500), Thebes sought Aegina's help in a war with the Athenians. Perceiving an opportunity to ally against a traditional rival, Aegina waged an undeclared war, and proceeded to raid the coast of Attica. In 491, Aegina offered earth and water to the Persians, a move met with great disdain by Athens, who appealed to Sparta for help. The two kings of Sparta, Cleomenes and Leotychidas, seized 10 of the most prominent Aeginetan citizens and sent them as hostages to Athens. After Cleomenes' downfall, the Aeginetans appealed to have their prisoners returned, but the Athenians refused. In response, the Aeginetans captured a sacred Athenian vessel carrying many leading Athenians. Around 490, all the actions of the past culminated in a failed Athenian plot to inspire revolt on Aegina, and indecisive naval battles off the coast of the island. In 480, Athens and Aegina formed a truce to unite against the Persians. Finally, Athens ended the ongoing hostilities by defeating the Aeginetans in a great sea battle (458).

Consequences

Aegina surrendered in 457 and agreed to pay tribute to the Athenians.

Attalus I of Pergamum (Reigned 241–197)

Attalus was the adopted successor of Eumenes I of Pergamum. He was the first of the rulers of Pergamum to refuse to pay tribute to the Galatians and after defeating them took the title of king, establishing the Attalid dynasty. Celtic tribes of Gauls had crossed from Europe to Asia in the first quarter of the third century and settling on both sides of the Halys River (the modern Kızılırmak), they levied tribute on the whole of Asia Minor as far as the Taurus Mountains from their territory known as Galatia. Attalus' refusal to pay tribute led to the unsuccessful Galatian attack and defeat and Attalus' assumption of the title of king.

Like his predecessor, Eumenes I, Attalus exploited Seleucid dynastic struggles and fought successfully against Antiochus Hierax, securing Asia Minor up to the Taurus Mountains. Achaeus, Seleucus III Soter's general, continued the war against Attalus, reclaiming the Seleucid possessions and confining Attalus to Pergamum. However, when Achaeus declared himself king Attalus allied with Antiochus III the Great and fought a joint campaign against Achaeus (216).

In 211, Attalus allied with the Aetolian League, and indirectly, Rome, joining them in the First Macedonian War (215–205). In 209, he was elected as one of the two main generals of the Aetolian League. Sending troops to fight alongside the Aetolians, he himself used Aegina as a base for naval operations against Philip V of Macedon. While plundering Opus in Locris, Attalus was almost captured. Learning that Prusias I of Bithynia had invaded his territory he returned home, taking no further part in the war, however, his Roman allies ensured that Attalus was included in the Peace of Phoenice that ended the war in 205.

Philip V of Macedon invaded Pergamene territory in 201 and unsuccessfully laid siege to Pergamum. When Philip abandoned the siege and took to sea, Attalus, along with his Rhodian allies, followed and fought

an inclusive naval battle with him off Chios.

Attalus concluded an alliance with Athens and also asked Rome for support against Philip V of Macedon. Unsuccessful attempts at negotiations between the allies and Macedon led to the outbreak of the Second Macedonian War (200–196). While attempting to persuade the Boeotians to join the alliance against Philip V, Attalus was taken ill at Thebes and returning to Pergamum, died there aged 72 in 197. He was succeeded by his eldest son Eumenes II of Pergamum.

Attalus II of Pergamum (Reigned 159–138)

Born in 220, the second son of King Attalus I and younger brother of King Eumenes II. Attalus undertook several embassies to Rome during his brother's reign. Attalus served alongside the Romans at the battle of Magnesia in 190 and their expedition against the Galatians (189). He succeeded his brother in 159. He received Roman support for his wars with Prusias II of Bithynia, and supported the Seleucid pretender Alexander I Balas against Demetrius II Nicator. He was succeeded by his nephew, Attalus III of Pergamum.

Attalus III of Pergamum (Reigned 138–133)

Son of Eumenes II, and nephew and successor to Attalus II, Attalus allegedly took little interest in statesmanship, focusing on gardening, agriculture, botany, and toxicology. He apparently wrote a treatise on agriculture, was a collector of fine art, and allegedly enjoyed modeling figures in wax and casting them in bronze. He died in 133 after ruling for just five years, bequeathing his kingdom to Rome.

Attendants, Military

Military attendants are known from Homeric times. In Homer, they are often called *therapontes* (retainers). They support the heroes who are the leading fighters (*promachoi*) on the battlefield, they drive chariots and carry equipment. In the late Archaic and Classical Periods, attendants appear commonly supporting the heavy infantry. They were usually personal slaves of individual hoplites. Thus, they are often referred to as *paides* (boys), a common term for a slave, reflecting an inferior and infantilized status. In addition to carrying the equipment of the hoplites, and even their arms and armor, such attendants would often set up camp, forage for food and cook meals. For example, Athenians on garrison duty at Panactum had such

paides who looked after them in the mess, doing chores like dinner preparation and on occasion they might plunder enemy property.

The most common Greek terms for such attendants included the *akolouthos*—attendant, *hyperetes*—assistant, *skeuophoros*—baggage carrier, and *hypaspistes* (pl. *hypaspistai*)—shield carrier. In Sparta, the role of attendants was played by the Helots, although some evidence suggests that the Spartans too had personal retainers or even youths separate from the Helot group. Thucydides tells us that, unusually, sometimes hoplites and cavalry carried their own food if they lacked attendants or—even more intriguingly—because they distrusted them. Attendants often appear assisting heavy infantrymen on vase paintings. They are always depicted as boys, smaller than their masters, and carrying equipment or arms, especially shields.

The role that these attendants played on the battlefield remains obscure. It is unlikely they fought invisibly side-by-side with those they served. Nevertheless, they do appear occasionally in the fighting in our sources. Thus, Xenophon's *hypaspistes* fell to his death in action on the march of the Ten Thousand. The Spartans had such shield-bearers and used Helots for this type service. In the fourth century, such attendants must have been well known to Greek society. They ultimately became a stock-figure like the boastful soldier in later Greek comedies. We have a statuette dated to the later fourth century of a theatrically masked figure carrying military and campaign equipment suggestive of a baggage-carrier (Berlin, Staatliche Museen zu Berlin, TC 7820).

The Macedonian army of Philip and Alexander had specialist units that bear all the trappings of regiments originally formed from those who supported the king carrying arms or protecting his person. Thus, the *hetairoi* (Companion) cavalry formed the king's bodyguard, and the *hypaspistai* or shield bearers made up an elite unit that led the infantry, but their title suggests an origin lying with those who carried the arms of the king like any attendants. Philip and Alexander had a reputation for traveling light if they could and for dislocating the main fighting force from the baggage train so that infantry might move more quickly and less encumbered. This had the effect of transforming the relationship between the fighting force and the baggage trains.

Such attendants continued in the service of soldiers into the Hellenistic Period. Alexander's funeral carriage was accompanied by a mass of road

makers (*odopoioi*) and mechanics (*technitai*) as well as soldiers (*stratiotai*). Many Hellenistic armies traveled with a baggage train, called the *aposkeue* (lit. “with the baggage”). These trains included many attendants and slaves, along with women and children, animals and equipment. Even garrison troops would have had attendants with them to support their lives. An important inscription that details the settlement of a dispute between Eumenes II of Pergamum and his mercenaries (Document 20) mentions alongside the fully paid, contracted and professional soldiers, unpaid men (*amisthoi*) and all those others with the soldiers. These latter may perhaps have been military attendants themselves who existed somewhere between full-time soldier and servant. Indeed, as war became more technical, specialists who could construct infrastructure, siege engines, ships, and machinery became an essential part of any Hellenistic army.

Thus, clearly, attendants played a variety of crucial roles in ancient warfare as support personnel, skilled and unskilled laborers, assistants to soldiers, and on occasion even combatants side-by-side with their masters and patrons.

Bactria, Bactrians

Bactria was a region in Central Asia that was independently ruled by Greek kings from ca. 250 to 130. Most of these kings are not named in ancient sources or the archaeological evidence but are known only from coins. Bactria comprised parts of modern-day Afghanistan, Tajikistan, and Uzbekistan; it was bordered by the Hindu Kush mountains in the south and east, the Jaxartes River (Syr Darya) in the north, and modern-day Iran in the west. Bactria was first settled by Greeks when Alexander the Great invaded it in 329. Due to its terrain and isolated tribes, it was the most difficult conquest of his campaign.

Bactria became an independent kingdom around 250 when the satrap Diodotus and his son Diodotus II gradually seceded from the Seleucid Empire. Euthydemus I, the first king after Diodotus II, was a usurper who endured a siege by the Seleucid Antiochus III (the Great), battled him, and finally made a treaty with him. Around 200, Euthydemus' son Demetrius I conquered lands south of the Hindu Kush and established Greek rule in ancient India around the Indus River. For the next 50 years, Greco-Bactrian kings ruled in both Bactria and India, although the exact chronology and territory of these kings is not clear. Some held power in both regions. At one point, the two regions were divided, as Eucratides the Great, while ruling in Bactria, engaged in war with a Demetrius (probably II) who ruled in India. Eucratides and the other Greco-Bactrian kings also regularly fought with the Parthians, a dynasty that claimed a piece of Seleucid territory around the same time as the Bactrians. One of the capital cities of the Greco-Bactrians was discovered by archaeologists near the Afghan village of Ai Khanoum. It contained a palace, mint, treasury, and classically Greek

buildings such as a gymnasium and a theater. The city was abandoned around 145 and overrun by nomadic warriors. The Greeks were driven out of the rest of Bactria over the next decade. Greek-named kings continued to rule in India until ca. 20.

Bandits

Banditry (or “brigandage”) is evident throughout Greek history, from the Archaic to the Hellenistic Periods. Just as with piracy, banditry flourished in periods of time or in places where there was little central authority or a dominant power willing and able to suppress such attacks. The same word, *leistes* (plural *leistai*), was used for a robber on land and for one who attacks at or from the sea. Piracy is far more prevalent in the sources, unsurprising given the nature of Greek terrain, which made movement by sea far easier than by land in most areas. Nevertheless there is evidence of banditry without the aid of ships, if mostly from mythical and fictional accounts.

Much like the motivations behind piracy, those who turned to banditry were motivated by different considerations. These could range from being sent into exile for political or financial reasons, poverty leaving little choice but to engage in banditry, or in later times mercenary forces no longer in the employ of a state deciding to use their skills for private gain. Bandits would target not only money and easily portable goods, but people as well. They might target households, settlements, or travelers, in the latter case being akin to highwaymen. Diodorus mentions a story in which a leader from the city of Priene ransomed from *leistai* a group of maidens who had

been taken from some distinguished families of Messenia. Bandits who occupied territory could also extract payments for safe passage through their lands. During his campaign against Persia, Alexander encountered the Uxians, a tribe many of whom inhabited the hills and did not recognize Persian authority. They demanded from Alexander the same payments they demanded from the Persians for crossing their lands. Alexander not only defeated the Uxians, but later also defeated their neighbors the Cossaeans, who also lived a life of brigandage in the mountains.

Banditry and raiding is a common theme in mythic stories from the earliest history of Greece. In the *Iliad*, Nestor recounts a story in which as a young man he went raiding, bringing back sheep, goats, cattle, and horses. Much like similar incidents of wandering raiders (pirates) in the *Odyssey*, when conducted by heroic figures raiding appears to have been a legitimate form of warfare. However, these are stories of Greek heroes, and the reality of banditry and raiding is far less glorious. According to Plutarch in his *Life of Theseus*, it was a difficult journey to reach Athens by land because of the actions of *leistai* and “evildoers.” On the borders of Megara, Theseus killed a supposed bandit named Sciron, who was wont to rob passersby. However, Plutarch says that Megarian writers tell a different story, saying that Sciron was in fact a just man who himself fought bandits. In either case robbery clearly appears to have been thought of as a less than noble pursuit, requiring the intervention of heroes to combat it. The Corinthian general Timoleon killed many tyrants in Sicily in the mid-fourth century, one of whom, Mamercus, was killed like a *leistes*—clearly a dishonorable way to die and demonstrating that the activities of *leistai* were not considered acceptable.

Pausanias relates a story about the fabled Sphinx in which she roamed the seas with a force of ships conducting piratical raids before settling on a mountain from where she conducted plundering raids until defeated by Oedipus. Certain areas were known as hotbeds of raiding and banditry. From Thucydides’ time to the late third century, Aetolia was known as a land of bandits and brigands who embraced such a lifestyle where others had long-ago abandoned it. This also demonstrates the problem of defining what should be considered banditry and, much like piracy, the lines between banditry and legitimate warfare by a city-state are blurred.

Thucydides too discusses piracy and banditry by land as prevalent in early Greek history. He says that some regions to his day retained the old

habit of carrying arms about with them, a habit hearkening back to the days when everyone in Greece carried arms because of the vulnerability of their settlements and the unsafe nature of their communications with each other. Little is mentioned of “highwaymen” outside of fiction, but it is reasonable to assume travel along roads could be quite dangerous, especially on the margins of state control, since police forces, where they existed, were concerned with law and order within cities, not in the wilderness between the pockets of civilization represented by *poleis*. Constant warfare and the impact of this upon local populations could also drive people into banditry, or at very least weaken state control in surrounding areas and leave people vulnerable to attack. Although fictional, Lucian’s *Dialogues of the Dead* has a character who tells the story of an Athenian killed by *leistai* near Eleusis, who berated his own rashness in taking with him only two servants, implying that there was safety in numbers when travelling. This incident supposedly took place near Mount Cithaeron and, much like the story of the Sphinx and the tribes Alexander fought, shows how mountainous terrain attracted bandits, providing easily fortified bases of operation that proved difficult for armies to reach. Certainly throughout later history and into the modern era, mountains have provided safe haven for all manner of marginalized and dangerous groups.

Mercenaries who no longer served a particular master could be very dangerous, forced to extract a living from local populations. A good example of this is the famous expedition of the Ten Thousand in Persia who, after their paymaster Cyrus had been killed, were forced to march to the sea. The army’s generals were looking for plunder and were dissuaded from attacking the Tibarenians only by bad omens from their seers. Soon afterward, however, they extracted provisions from the estates of the Cotyorites, who would not provide the army with a market nor allow their sick within the city. The generals justified this plundering as necessary for the army’s survival since the Cotyorites would not open a market for them. Mercenary bands were well armed and experienced warriors, and without a steady source of pay could present a threat to those around them.

Most ancient sources are concerned with *leistai* as pirates raiding on and from the sea, helping to demonstrate the importance of the sea in Greek history. Nevertheless banditry on land was an issue throughout Greek history, being prevalent in the Bronze and Iron Ages and perhaps increasing in severity with the widespread proliferation of trained mercenary forces in

the late Classical and Hellenistic Periods.

Bithynia

Bithynia, located in modern Turkey, was a region in northern Asia Minor, on the southern end of the Euxine (Black Sea), to the east of Chalcedon. The area was mountainous and forested, although with fertile river valleys. It was a Thracian area but subject to early Greek influence from several colonies, the largest of which were Chalcedon and Heraclea. The local tribes often fought the colonists, but in the sixth century the area was conquered by Croesus of Lydia. When Cyrus the Great conquered Lydia in the mid-sixth century Bithynia became part of the Persian Empire, although the region gained some measure of autonomy. In 298/7 Zipoetes, a local dynast who had been ruling Bithynia since 326, proclaimed himself its first king. He maintained Bithynian independence under Alexander the Great's successors, notably Lysimachus and the Seleucids, and in 301 defeated Chalcedon and Astacus.

While the early history of Bithynia is characterized by successful resistance to invasion, the kingdom became progressively weaker over the next 200 years. By the early third century, the dynastic names such as Nicomedes I (Zipoetes' successor) demonstrate a Hellenizing influence in the court—perhaps in similar fashion to Pontus, where the court took on a distinctly Greek character. At this time Bithynia came under considerable pressure from the Celts (Galatians). Nicomedes I originally brought them to Asia Minor (278/7) to use as mercenaries against his brother Zipoetes II, to

resist Antiochus I Soter, and to expand his territory. Although successful in this, the Celts later seized the opportunity to expand their own power. Nicomedes I's heir was killed in battle against them, and they were finally defeated (228) by his grandson, Prusias I. Prusias further expanded Bithynia at the expense of neighboring Pergamum and Heraclea Pontica. Despite giving refuge for a time to Hannibal, Prusias astutely remained out of Rome's war with Antiochus III (the Great).

However, in the second century, under Prusias II, Bithynia was defeated by both Pontus and Pergamum. Prusias sent his son (Nicomedes II) to seek Roman assistance (partly to get the popular prince out of the country), but the Romans instead supported Nicomedes II's overthrow of his father. Nicomedes III succeeded his father in 127, and after some successes in Paphlagonia and Cappadocia, was forced to withdraw under Roman pressure. His successor, Nicomedes IV Philopator (reigned ca. 94–74) was forced out by his brother and Mithridates VI Eupator of Pontus but restored by Rome. However, taking advantage of Rome's distraction during the Social War (91–87), Mithridates conquered the whole of Bithynia and exiled Nicomedes IV. Although the Romans restored him again soon after (85/4), he was effectively a client king, and formally recognized Roman control by leaving his country to Rome in his will. When he died (75/4) Bithynia became a Roman province.

Biton (Third or Second Century)

Biton was the author of a short treatise entitled *Construction of Military Machines and Catapults*. It is addressed to a King Attalus, variously identified as Attalus I (241–197) or II (160/59–138) of Pergamum, but the highly technical content was clearly intended for engineers. The work comprises design specifications and diagrams for six historical devices by five named inventors: two stone-throwers, a *helepolis* (a siege tower), a *sambuca* (a pulley-operated siege ladder), and two types of *gastraphetes*. Biton's treatise is the most important source on tension-powered artillery, but it remains unclear why he chose to recommend antiquated devices that had long been superseded by torsion-powered technology. Biton mentions another, now lost, work entitled *Optics*, in which he explained a method for calculating the heights of walls.

Black Sea, Greek Cities of

The Black Sea (known in antiquity as the Pontus Euxinus or Euxine) is a large inland sea lying between Anatolia, Europe, and the Caucasus. Its ancient name meant "the Hospitable Sea" (Strabo 7.3.6). To its north lay Maeotis Lake (the modern Sea of Azov in the Ukraine), connected by the Cimmerian Bosphorus, and to its south it emptied into the Propontis (the modern Sea of Marmara in Turkey) via the Bosphorus then via the Hellespont into the north Aegean Sea. The Black Sea is fed by a number of large and deep rivers, which are navigable into the interior and are responsible for the

extremely fertile land on the northern shores of the Black Sea. The Black Sea itself was rich in resources, such as sturgeon and herring, while the eastern shores were rich in minerals and precious metals.

Due to the region's richness, it is no surprise that the Greeks began to aggressively colonize the shores of the Black Sea, establishing numerous cities as early as the eighth century. The major proponents of these colonies were said to have been the cities of Megara and Miletus, which alone are credited with establishing up to 90 colonies in the area. By the fifth century, many of these colonies had become successful cities in their own rights, minting their own coinage, or creating local federated alliances. Panticapaeum, on the Cimmerian Bosphorus, became the capital of the burgeoning Bosphoran Kingdom in the mid-fifth century, while other cities such as Heraclea Pontica and Istria established colonies of their own and became regional centers.

Heraclea Pontica was founded in 554 by colonists from Megara, accompanied by some Thessalians and Boeotians, on the southern coast of the Black Sea. The fertile lands surrounding the city led to it becoming a major exporter of wine, mainly to the cities of the northern Black Sea coast. During the fifth century the city was friendly to Persia, apart from a brief period when it joined the Delian League in 424. Xenophon, during the famous *anabasis* of the Ten Thousand, visited the city. Tyranny, established in 364 by Clearchus, led to the flourishing of the city and the expansion of its territory inland and along the coast—with a commensurate flourishing trade in the Black Sea. During the second century it was absorbed into the kingdom of Pontus, before being integrated into the Roman province of Bithynia-Pontus in the first century.

Istria was the first and foremost Greek city on the western shores of the Black Sea, colonized by the Milesians in the middle of the seventh century. Fine agricultural land and abundant fish ensured that the city became prosperous, and pottery indicates trade contacts with Rhodes, Chios, and Athens, as well as other Black Sea cities. Due to its proximity to the Danube, the city was a conduit for transmitting Greek goods and ideas inland. It withstood attacks from tribes of the interior, before becoming part of the Roman province of Moesia in the late first century.

Boeotia, Boeotians

Boeotia's natural frontiers were well defined, enclosing rich agricultural land, situated in a pair of fertile river valleys in central Greece, the Asopus in the south and the Cephissus in the north, bounded at the north by the Chlomon massif, at the south by the Parnes massif, the Corinthian Gulf to the west, and the Euboean Channel to the east. Until it was drained in 1886, Lake Copaïs formed a semi-seasonal barrier (nearly dry in summer) and divided Boeotia into two distinct areas, the district beyond the lake to the northwest, dominated for most of its history by Orchomenus, and the large valley of the Asopus, dominated by Thebes. The valley of the Cephissus forms a natural defile through which any invaders from the northwest must pass. It is here that Chaeronea was situated, the site of several pivotal battles in antiquity. This northwestern boundary with Phocis remained remarkably stable throughout antiquity, but the southeastern frontier, the border which Boeotia shared with Athens, and the one which would seem better delineated by the Parnes massif, was nevertheless in a constant state of flux throughout the sixth and fifth centuries.

By the middle of the sixth century, the political geography of Boeotia had taken rough shape. This was undoubtedly a slow process, by which the larger city-states began through conquest or incorporation to absorb smaller communities. By 600, four principal *poleis* of Boeotia had emerged as dominant powers: Thebes in the very center of Boeotia, Orchomenus to the northwest of Lake Copaïs, Thespieae just south of the lake, and Tanagra in the eastern district. Other *poleis* scattered throughout Boeotia remained, with varying degrees of local power of their own, including Plataea, Haliartus, Hysiae, Copae, Lebedaea, Coronea, and Chaeronea. All of the cities of Boeotia, except Plataea, were ruled by narrow aristocratic oligarchies.

Most scholars accept that the Boeotians possessed a sort of federal government (commonly called the “Boeotian League”), which at the very least provided a mechanism for the common defense of Boeotia as a whole. Unquestionably, the Boeotians were culturally homogenous, speaking a common dialect of Greek and sharing distinct cultic traditions, but the Persian Wars mark a major turning point for Boeotia and the Boeotians, as indeed they did everywhere in Greece. The Boeotians were not united in common defense, and the Thebans infamously medized or surrendered to the Persians after Thermopylae fell in 480. The Thespians and Plataeans went their own way here as well, opting to keep fighting against the Persians, a choice that would engender conflict with Thebes and the rest of Boeotia in the latter half of the fifth century. For example, by the time of the outbreak of the Second Peloponnesian War (431–404), Thebes capitalized on the inevitable conflict between Athens and Sparta to make an attempt to take over Plataea, and its share of the federal government. The attempt succeeded, and by the time of the battle of Delium in 424, the power of Thebes was such that it was able to exercise hegemonic control over all the rest of Boeotia. The Thebans emerged from the Peloponnesian War far more powerful than when they began it, not only having solidified control over all Boeotia, but also having enriched themselves by plundering Attica for years. The prestige of the Boeotians was at a height. The Spartans therefore began to fear the power of the Boeotians—just as the Boeotians feared the Spartans.

From 395–371, the Boeotians were engaged in a series of conflicts off and on again and in various combinations with Sparta, Athens, and Corinth. This included a period when Thebes was controlled by a Spartan garrison (382–379). However, under the leadership of the Thebans, the Boeotians dominated nearly all of Greece between the decisive defeat of the Spartans at Leuctra in 371 and the costly battle of Mantinea in 362. Eventually, the Boeotians, like the rest of Greece, would fall under Macedonian hegemony after the battle of Chaeronea in 338, and Thebes itself, the largest city of Boeotia, would be completely destroyed by the Macedonian army of Alexander the Great in 335.

Boeotian League

Boeotia furnishes the earliest evidence for Greek multi-*polis* regional military and economic cooperation evolving into a federal league, and this is very important for understanding Greek federalism. Around 519 the Plataeans resisted the Thebans who were "pressing" them, apparently to become part of the League (Herodotus 6.108). Sixth-century coinage of Boeotian cities sported common obverses. Far more conclusively, Boeotarchs, chief magistrates of a Boeotian federation, are mentioned for 480–479.

From 457–446, Boeotia was controlled by Athens, but after 446, an autonomous federal Boeotia appears, composed of electoral units, perhaps 9 units before 427, and 11 after. The largest cities with their dependencies counted for over one unit; the smallest were grouped together as a single unit. Each unit had 1 Boeotarch and 60 members on a federal council of 660. Epigraphy in Boeotia's federal decrees attests to a *koinon* (confederacy) of the Boeotians.

In 386, Sparta, under the autonomy principle of the King's Peace, insisted on the League's dissolution. The Boeotian League was revived again in 378. The Boeotarchs seem all to be Theban. The decision-making body

now was an assembly—meeting in, and dominated by, Thebes. Religious and economic ties helped to maintain the loyalty of member cities. The well-organized nature of the League and its military resulted in a victory over Spartan forces at the battle of Leuctra in 371. A brief period of Theban hegemony followed where Thebes supported federalism among its allies just as Athens had supported (and exported) democracy. However, this hegemony faltered upon the deaths of its generals Pelopidas (364) and Epaminondas (362).

The city of Thebes was destroyed in 335 after revolting against Alexander the Great, but the Boeotian League continued into the Hellenistic Period, based now not on electoral units but on cities. A representative body convened regularly at Onchestus. The League now possessed seven districts, and officials called *aphedriates* represented these districts, making dedications on behalf of “all the Boeotians.” Thebes was refounded ca. 316, and it eventually (287?) became a member of the League again, though not its political hegemon. The Boeotian League’s cities joined the Aetolian League in the mid-third century and then supported Macedon before being disbanded by the Romans.

The great significance of the Boeotian League is that it points to tendencies of regional cooperation in terms of politics, economies, and religious expression evolving into, essentially, multicity states. Such multicity leagues would become increasingly important in the Hellenistic Period, when armies operated on a much larger scale than had been the case in preceding eras, and a single *polis*’ fieldable army was no match for Hellenistic dynasts’ enlarged military forces.

Bosporan Kingdom

The Bosporan Kingdom was a small Hellenized kingdom located on the northern shores of the Black Sea (in modern Ukraine and Russia), which was founded in around 438 and lasted until 108 when it was absorbed into the empire of Pontus by Mithridates VI Eupator. The capital of the kingdom was situated at Panticapaeum at the very easternmost edge of the Crimean Peninsula, on the shores of the Cimmerian Bosporus. From this vantage point, the Bosporan Kingdom was able to control trade along these narrow straits, which separated the Maeotis Lake (the modern Sea of Azov) from the rest of the Black Sea.

While Panticapaeum was originally a colony founded by Miletus in the early sixth century, it was joined together in 480 with a number of other independent Greek colonies in the region, such as Phanagoria and Hermonassa under the rule of a line of dynasts known as the Archaeanaetidae. This family was removed from power in 438 by a Hellenized Thracian named Spartocus I who founded the ruling line of the Spartocids. The stability of their rule, and the funding of their steady military expansion and conquest over the next two centuries, is closely linked with the increasing demand for Ukrainian grain in Athenian stomachs. Demosthenes' speeches indicate the importance of this imported grain to Athenian power during the fifth and fourth centuries, and later Bosporan kings—such as Spartocus II and III as well as Pairisades I—were voted honorific titles and other honors by the Athenian assembly.

The relationship was mutual, as the Spartocids received tax exemptions while in Athens and Athenian merchants had special status in the Bosporan Kingdom. The Spartocids also tacitly supported Athenian democracy, sending dedications to Athens after its liberation in 307 and further gifts after it successfully rebelled against Demetrius I Poliorcetes in 287. During the third century the kingdom remained a part of the broader Hellenistic diplomatic scene, sending an embassy to Ptolemy II Philadelphus in 254/3, as well as making dedications at Delos. During the third and second

centuries, the Bosphoran Kingdom suffered from dynastic struggles leading to internecine strife. Under pressure from expansionist Scythian raiders (despite intermarriage with them) the last of the Spartocids, Pairisades V, readily entrusted the Bosphoran Kingdom to Mithridates VI, who absorbed it into his growing empire of Pontus in 108.

Brasidas (d. 422)

Brasidas, son of Tellis, was an energetic and innovative Spartan commander during the Peloponnesian War of 431–404. He first appears in 431, saving Methone in Laconia in a typically audacious move. The Athenians had made a landing nearby, and while they were scattered and focused on Methone's wall, Brasidas dashed through them and into the city with a hundred hoplites. For this exploit he was the first Spartan to be officially thanked in the war.

In 429, with Brasidas as adviser, the Peloponnesian fleet deceived the opposing admiral, Phormio, into thinking they were heading for Naupactus, suddenly changed course, and caught him by surprise. However, superior Athenian experience enabled them to turn the tables during the pursuit and

recover their captured vessels. Shortly afterward Brasidas was involved in a daring raid on the Piraeus that failed, but caused considerable alarm in Athens. In 427, again a naval adviser, Brasidas suggested vigorously following up a naval victory off Corcyra with an attack on the city itself, but the commander ignored him.

In 425, Brasidas, commanding a trireme, led the attempt to expel the Athenians from Pylos. He was wounded and lost his shield, which the Athenians used in their victory trophy. The following year Brasidas, again commanding land forces, prevented the loss of Megara by his swift action when Athens seized its port, Nisaea.

Later in 424, Brasidas led 700 Helot hoplites, reinforced by Peloponnesian mercenaries, against the Athenian possessions in Thrace and the Chalcidice. The composition and relatively small size of the force suggests the Spartans may have thought it would only be of nuisance value, although sending 700 Helots so far from Sparta was designed to assist security at home. Brasidas may have proposed the expedition and certainly volunteered to lead it.

Brasidas' performance completely justified his selection as commander. He traversed a hostile Thessaly by a mixture of bluff and speed—not easy with an infantry army facing the noted Thessalian cavalry. Brasidas used oratory, threats, diplomacy, and (where needed) the use of force, to secure several Athenian allies in the north. His greatest prize, though, was the city of Amphipolis—a strategically and economically important city east of the Chalcidice and the Strymon River. Brasidas was killed at Amphipolis in 422, resisting an Athenian attempt under Cleon to recover the city. Although Cleon seems to have mishandled the tactical maneuvering outside Amphipolis, Brasidas won the battle by careful preparations and then launching his sortie at exactly the right moment to take advantage of Cleon's mistake. After Brasidas' death the Amphipolitans replaced Hagnon, the Athenian founder of the city, with Brasidas, awarding him hero status. This was a fitting honor to an energetic and audacious soldier whose successes in the north enabled Sparta to force Athens to negotiate the Peace of Nicias in 421 and bring about a temporary halt to the war.

Brennus (d. 278)

Brennus was a king of the Tolistobogii, a group of the Celts whom the Greeks knew as Galatians (sometimes wrongly translated as “Gauls”). “Brennus” may well have been a title, meaning “king,” rather than his actual name. We know nothing of his early life, but Pausanias believes that it was he who urged his fellow Celts to invade Greece in 279, encouraging them with stories of the rich plunder to be had in Greek cities and sanctuaries. He was a capable military commander, who skillfully outflanked the Greek defenders at the Spercheius River and at Thermopylae. However, his winter 279/8 campaign against Delphi met with disaster amidst the mountains of central Greece, and Brennus was wounded. The retreating Celts took Brennus with them, still alive, but he committed suicide, either by stabbing himself or by drinking unmixed wine (i.e., wine with no water added: the mark of a barbarian in Greek eyes). His suicide may have been a form of ritual atonement, or done in fear of the retribution of his fellow Celts for a disastrous campaign.

Bribery and Corruption

Allegations were common that Greek political and military leaders had taken money to act against their states' interests. Prosecutors, witnesses, and juries could also easily be said to have taken money to act wrongly. This is perhaps to be expected in the intensely competitive political life of small city-states where poverty was rife and opportunities for legitimate enrichment few. The pressure on leaders, especially in democracies, to give generous benefactions to public purposes may also have contributed to this common belief in venality. Whether such allegations were factual is seldom known for certain.

The Spartan king Leotychidas II is said (Herodotus 6.72) to have been caught taking bribes during a campaign in Thessaly ca. 477 when he was found sitting in his tent on a glove stuffed with money. If true this account gives a rare instance of some material proof of bribery, as opposed to mere belief or suspicion. The Spartan king Pleistoanax broke off an invasion of Attica in 446/5 and was later exiled for having taken bribes to do so. Pericles apparently included in his audit of accounts after his term as *strategos* in this year the amount of 20 talents "for necessary expenditure" (cf. Aristophanes, *Clouds* 859). Whether Pericles engaged in some clever misrepresentation to inflame Spartan anger against what had certainly been a cautious decision by Pleistoanax or Pleistoanax thought he could get away with taking such a large sum must remain uncertain. Thucydides at least is noncommittal (2.21).

Allegations of bribery against military leaders were commonly made but are hard to prove. Such allegations could have consequences. In 413, Nicias was reluctant to withdraw from the now hopeless siege of Syracuse because he feared he would be charged on returning to Athens with having taken a bribe (Thucydides 7.48; compare Document 12). Interestingly, such suspicion could attach itself even to a man of his great wealth. Dionysius of Syracuse in 406 discredited the city's generals by alleging they had been bribed, not because he had any evidence, apart from their inefficient conduct of the war against Carthage, but because he aimed to make himself tyrant by gaining control of the city's forces (Diodorus 13.96). That generals who made poor or unacceptable decisions had been bribed was readily believed; for example, the three Athenian generals who had achieved little in Sicily were convicted of taking bribes (424: Thucydides 4.65).

Political opponents could also be denounced as corrupt. In 343 in the “False Embassy” trial, Demosthenes alleged that Aeschines’ betrayal of Athenian interests showed that he had taken bribes from Philip II of Macedon. Aeschines in reply claimed to have acted in good faith on the best available information and for good measure accused Demosthenes himself of corruption. Aeschines was acquitted by a narrow margin, which is remarkable in view of Philip II’s persistent reputation of buying supporters in Greek cities.

Corrupting a jury at Athens is alleged in the case of Anytus, who failed to arrive in time to rescue the Athenian post at Pylos from Spartan attack (409: Diodorus 13.64). If anything like the elaborate and complex system in use in the late fourth century for selecting and empanelling juries (*Ath. Pol.* 63–69) applied at Anytus’ trial, he pulled off something extraordinary. We are probably dealing with prejudice against a democratic leader who later (399) prosecuted Socrates.

It is sound method to treat all reports or allegations in ancient sources of bribery and corruption with caution. There may be good reason to accept that certain individuals were above taking bribes: for example, Pericles, Lysander, or Phocion. Hard evidence is needed to authenticate the allegations of bribery that swirl around persons such as Themistocles, Cleon, or Demades.

Byzantium, Byzantines

Byzantium (later Constantinople, now Istanbul) was a Megarian colony founded in the mid-seventh century on the European side of the Bosphorus.

Tacitus (*Annals* 12.63) states that the Delphic oracle directed the colonists to found their city “opposite the land of the blind”—a reference to those who had founded Chalcedon on an inferior site on the opposite shore. The site had a fine natural harbor, good fishing grounds, and a strategic location where the Euxine (Black Sea) joins the Bosphorus, allowing access to the Aegean Sea via the Hellespont (Dardanelles). This was an important route for grain imports to Greece, and in particular to Athens, and Byzantium was ideally located to control it.

Much of Byzantium’s history is as a prize between competing powers. The Persians seized control ca. 512 and retained it (apart from a brief period during the Ionian Revolt) until after the Persian defeat in the Second Persian War (480–479). Following liberation (478) Byzantium joined the newly formed Delian League but unsuccessfully revolted (440) over Athens’ growing domination. Byzantium was reduced to subject status within the Athenian Empire—its annual tribute of 15 talents demonstrates its wealth.

In the latter stages of the Second Peloponnesian War, Byzantium changed hands several times. In 411, it revolted and accepted a Spartan garrison, was recaptured by Athens (408), and recovered by Sparta after Athens’ defeat at Aegospotami (405).

For the first half of the fourth century, Byzantium alternated between several great powers. Although often aligned with Athens and a member of the Second Athenian Confederacy (378/7), Byzantium at one point had a short-lived alliance with Thebes (364). It also fought Athens in the Social War of 357–355, securing independence. Attacked by Philip II of Macedon, Byzantium survived an epic siege (340–339)—with Athenian and Persian support—but by 335 was supporting Alexander the Great as an ally.

After Alexander’s death Byzantium maintained independence, but paid a heavy price for it from ca. 277 when attacked by the Celts. Byzantium had to pay a lot to avoid Celtic attacks on its *chora* (agricultural hinterland). Attempting to raise money for this by increasing shipping tolls in the Bosphorus alienated Rhodes, a major commercial and naval power, which forcibly ended the practice in 220/19. However, at the end of the century Byzantium aligned with both Rhodes and Attalus I Soter of Pergamum against Philip V of Macedon, whose Aegean naval ambitions threatened all three. They appealed to Rome, and Byzantium’s generally consistent support for Rome saw it emerge from the Macedonian Wars as a favored Roman ally.

C

Callias, Peace of

The Peace of Callias was a peace treaty between Persia and the Delian League. Named after its Athenian negotiator, the peace was supposedly agreed ca. 449/8, but in the fourth century Theopompus declared it a forgery. Since then the treaty's existence has been the subject of considerable debate. While the evidence tends to support the existence of the peace, many writers over the years have remained unconvinced. Perhaps the safest view is that whether or not a formal treaty was formally concluded ca. 449/8, a *de facto* peace occurred then, and was later formalized (424/3).

There is no single detailed account of the treaty, but its terms can be reconstructed from several sources. These suggest that the Greek cities in Ionia would demolish their walls and continue to pay tribute to Persia but would otherwise be self-governing. Land and sea demilitarized zones were established, with no Persian troop movement west of the Halys River and no war ship movement into the Aegean. The precise boundaries of the sea zone are unclear but were probably Cyanaea (the mouth of the Black Sea) and (off the southern coast of Asia Minor) Phaselis and the Chelidonean Islands. The Islands are about 8 miles (13 kilometers) west of Phaselis and 25 miles (40 kilometers) further out to sea. It therefore seems likely that one was the landmark for close coastal traffic and the other for ships further out.

Callicrates (d. 149/8)

Callicrates of Leontium was a politician in the Achaean League, holding the position of *strategos* (general) in 180/79. In his year as *strategos*, Callicrates advocated a policy of accommodation with Rome, which set him against the faction headed by Lycortas, the father of the historian Polybius, and Polybius himself, who advocated a neutral stance vis-à-vis Rome. Although Polybius would later change his position to one of full cooperation with Rome, he remained an implacable enemy of Callicrates, accusing him (24.10) of being “the instigator of great evils for all the Greeks, and especially for the Achaeans,” after he advised the Senate to actively support and favor pro-Roman Greek politicians against their rivals. The result, as Polybius saw it, was the loss of free political debate in Greece, and the loss of some level of Greek autonomy. Polybius’ opposition to Callicrates was transformed into bitter hatred, no doubt because it was Callicrates who assisted the Romans in identifying “unreliable” Achaean politicians, including Polybius himself, and exiling them to Italy following the Third Macedonian War. Callicrates died while on a diplomatic mission to Rome in 149/8.

Callicratidas (d. 406)

Callicratidas was a Spartiate who held the office of navarch, commanding

the Spartan-led fleet in 407/6. He took over the command from Lysander, who had enjoyed a close relationship with Cyrus, the Persian supreme commander in the west. Whether because of his own personal convictions or Cyrus' own political calculations, Callicratidas was unable to obtain from Cyrus the money necessary to maintain his fleet.

Callicratidas' first action had been to raise another 50 ships from Sparta's allies. He faced down opposition to his authority by Lysander's cronies and pressured Sparta's allies in the region, especially Chios, for money. Under his vigorous leadership he brought the Spartan-led fleet up to 170 ships and defeated the Athenian fleet, which had been run down to 70 ships, capturing 30 and driving the rest into the harbor of Mytilene, where he blockaded it. Only with the greatest difficulty did the Athenian commander Conon manage by a clever stratagem to get a trireme through to Athens with news of the blockade. By a supreme effort, the Athenians assembled every trireme they could for a relieving force of 110 triremes and made up the crews with any available manpower, including slaves and, most unusually, Athenians from the wealthy cavalry class.

Such a vigorous and unexpected counter-move was difficult for any commander to foresee. Callicratidas attempted a night-departure to take the Athenians by surprise but was frustrated by stormy weather. The resulting battle fought off the Arginusae Islands in about August 406 between the Athenian relieving fleet and the 120 ships Callicratidas took from the blockade of Mytilene was the largest in Greek history. The Athenians won, sinking over 70 ships and losing 25. For the time being Athens had regained control of the sea.

Callicratidas himself drowned when he fell overboard as his ship was ramming another. He is a puzzling figure. He declared that it was wrong to enslave Greeks in war and then did this to the Athenian garrison captured at Methymna. He declared that it was shameful for Greeks to be asking Persians for money to fight one another and that on his return to Sparta he would advocate a reconciliation with Athens. His death precluded any attempt to accomplish this ideal but such protestations, and his old-fashioned patriotism and courage, gave him a brilliant posthumous reputation.

At Arginusae his fleet, which had better rowers than the Athenians, was drawn up in a single line to carry out the maneuver known as the *diekplous* but the battle turned into a prolonged combat of single ship against ship. As

a naval commander Callicratidas lacked luck and the touch of genius needed to win a big, set-piece battle.

Callimachus (d. 490)

Callimachus of Aphidna was the Athenian “war-archon” or polemarch at Marathon (480). Herodotus (6.109) says he had an equal vote with the 10 *strategoi* (generals) but the *Athenaion Politeia* (22.2) states that the polemarch was still the overall commander at that date. The latter is probably correct, but at any rate Callimachus exercised the casting vote to implement Miltiades’ plan to attack the Persians. On the day of the battle, in accordance with Athenian tradition, the polemarch was in the position of honor, commanding the right wing. Callimachus was killed in the fight to prevent the Persians escaping in their transport ships. After the battle a statue of Nike (“Victory”) was erected to honor Callimachus. This “Nike of Callimachus” was damaged 10 years later in the Persian destruction of the Parthenon but fully restored in 2010 CE.

Callinus (Active ca. 650)

Callinus of Ephesus lived in the mid-seventh century and was celebrated for poems in the elegiac meter. He is the earliest known exponent of a literary form commonly used for moral and political exhortation (compare Tyrtaeus). His work is known only through a handful of quotations and references by later writers. One of these refers to a war between Ephesus and Magnesia and another to fighting against the Cimmerians, a group of nomads expelled from south Russia about this time that carried out extensive destructive raids in western Asia Minor before succumbing to epidemics and constant warfare.

Callinus emphasizes the warrior code of honor and courage as well as devotion to the cause of defending the state. His evidence is important for the early development of Greek warfare.

Callisthenes of Olynthus (d. ca. 327)

The historian Callisthenes of Olynthus accompanied Alexander's invasion of the Persian Empire. He fell out with Alexander over the introduction of *proskynesis*, or prostration, a controversial form of reverence. Soon afterward he was implicated in the Page's conspiracy and was executed. His eulogizing of Alexander's achievements laid him open to the charge of flattery.

Camp Followers

In wealthy, slave-owning Greek city-states like Athens, it was normal for each hoplite to be accompanied by his personal slave, who would carry his bedding and his cooking utensils, and would cook for him. These were called *skeuophoroi* or “baggage-carriers.” Wealthy cavalrymen would take a number of servants or grooms on campaign with them. In times of battle the *skeuophoroi* would be under the control of a *hyperetes*, an equivalent of a modern logistics sergeant-major. In poorer states, such as the communities of Arcadia and Achaea, which in 401 supplied the bulk of the Greek volunteers for the *Anabasis*, hoplites would carry their own gear and cook for themselves, or take along members of their family too young to serve, but keen to see the world. Such were the young men sent out to gather brushwood to fuel the cooking fires that Xenophon mentions. Generals would try to limit the number of these noncombatants. Philip II banned wagons. All troops carried their own weapons, baggage, and grain for 30 days, and each section of 16 men was allowed one servant “who was detailed to carry the mills and ropes,” (Frontinus 4.1.6) and the cavalrymen were allowed one groom.

In the Classical Period, where campaigns were generally short, the camp followers were usually limited to these personnel, but from the fourth century standing armies were in operation for increasingly lengthy periods, and other needs would arise among the soldiers that had to be catered for. The first such army for which we have adequate evidence was the 10,000 Greek mercenaries whose march inland is described by Xenophon. The mercenary army was forced to give up everything superfluous, and the soldiers were searched, even so the soldiers would attempt to smuggle

through “a handsome boy or woman that he had set his heart on” (Xenophon, *Anabasis* 4.1.14). A Phoenician market followed Alexander’s army to cater for all its needs—just as a Lydian market had accompanied Cyrus the Younger’s army in 401. In these longer campaigns, camp followers could include traders (including slave traders who would buy prisoners of war), prostitutes, doctors—in fact anyone who could make money from an army—as well as the slaves, attendants, or even families of the soldiers. It was not always a safe occupation—camp followers of a losing army could be killed or enslaved and many of them died in Alexander’s crossing of the Gedrosian desert.

The longer an army was in the field the larger the number of camp followers would grow, and their relationship to the troops would strengthen. In 316, the Greek general Eumenes won the battle of Gabiene, but he was handed over to Antigonos I Monophthalmus by his elite infantry force, the “Silver-Shields” (Argyraspides), “since their baggage had been taken, and their children and their wives and many other relatives were in the hands of the enemy” (Diodorus 19.43.7).

Caria, Carians

Caria was a region along the southwest Anatolian coast. It was defined geographically as the region south of the Maeander River as far as the Rhodian *peraia* (area on the mainland controlled by an island state), and contextually as between Ionia and Lycia. There were Greek settlements

within Caria, particularly along the coast. The Carians were not Greeks, although they became Hellenized under the Hecatomnid dynasty in the fourth century. The Carians considered themselves indigenous.

Carians were notable mercenaries and pirates, fighting as far away as Egypt. The Greeks believed that Carians alone sacrificed to a military Zeus, and that they were the originators of crested helmets, shield handles, and shield emblems. According to Herodotus, Carians fought as mercenaries in Egypt in the seventh and sixth centuries.

By the late sixth century, the Carians were tribute-paying subjects of the Persians, but in 498 they joined the Ionian Revolt, in the course of which they were defeated in battle at the Maeander River and at Labraunda, but then ambushed and destroyed the victorious Persian army on its march into Caria. Carians probably fought at the battle of Lade, but after the Greek defeat there they were reconquered by Persia. In 480, Carians fought on the Persian side at the battles of Artemisium and Salamis, the latter under command of the Halicarnassian queen Artemisia, who according to Herodotus accidentally gained favor from Xerxes by sinking a Carian ship from Calynda.

In the fifth century, the Carians paid tribute to Athens, and some cities fought for Athens in the Second Peloponnesian War, but in 411 Athenian weakness allowed Persia once again to assert its control. In the fourth century, Caria came under the control of a Carian dynasty of Persian satraps, the Hecatomnids, the most famous of whom was Mausolus. The Hecatomnids adopted a mixture of traditional Carian and Greek culture, moving the seat of the satrapy to the coastal city of Halicarnassus and developing the Carian religious sanctuary at Labraunda with Hellenizing buildings. After the death of Alexander the Great, parts of Caria at various times came under Seleucid, Pergamene, Ptolemaic, Antigonid, and Macedonian rule. Campaigns by Rhodes in the early second century led to several Carian settlements gaining freedom. Soon afterward Caria passed under Roman control, with most settlements gaining autonomy.

Caria, Greek Cities in

Among the various groups populating Caria were Greek *poleis* situated along the coast. They were part of the Greek world, but also interacted extensively with the Carians of the inland. Where settlements (such as Caunus) were not Greek, extensive Hellenization occurred during the Classical and Hellenistic Periods. The distinction between Greek and Carian, although clearly made by Diodorus, is therefore more uncertain for the modern researcher. Many settlements are attested as *poleis*, or are included in the tribute lists of the Delian League, while not being predominantly Greek in population or culture.

The major cities that were either clearly regarded as Greek from the Archaic or Classical Periods onward, or which had very close Hellenic connections, were Cnidus, Iasus, Heraclea, Myndus, and Mylasa. North of Caria were three Greek *poleis*—Miletus, Myus, and Priene—that were regarded geographically as within Caria, but culturally were considered to be Ionian.

Latmus, renowned for its stone, was situated near Miletus in the north of Caria, at the head of a gulf that is now an inland lake. It was refounded as Heraclea in the fourth century. There was a strong Carian element in the population, yet also prominent Greek architectural aspects.

Further south, Iasus was a heavily fortified settlement on an island just off the coast. Along with city-walls, Iasus had another wall on the mainland, apparently protecting the approaches to the island. Iasus was sacked by Sparta in 411 and sold (along with her population) to Tissaphernes who installed a garrison. Unfortunately, having returned to the Athenian side by 405, Iasus was then sacked again, by the Spartan Lysander, its 800 strong fighting-age population slaughtered, women and children enslaved, and the city razed. Nevertheless, Iasus endured to be

conquered by Alexander.

Mylasa, inland from Iasus, was the old Carian capital. It was not originally a Greek city, but under the Hellenizing Hecatomnids in the fourth century and afterward it acquired close Greek connections. The major Carian sanctuary of Labraunda, regarded by the fourth century as a sanctuary of Zeus, was in its territory.

Further south, Halicarnassus was a coastal city with a mixed Greek and Carian population. It was the birthplace of Herodotus, and in the fourth century replaced Mylasa as the capital of the satrapy.

Myndus was a fortified settlement on the tip of Halicarnassus' Peninsula. When the city would not surrender to him, Alexander the Great unsuccessfully attempted to take it by sapping.

Cnidus was an unwallled *polis*, situated on a promontory in far southern Caria. The Cnidian, who claimed originally to be Dorians from Sparta or Megara, provided the meeting place a group of Dorian cities, the *hexapolis*. In the mid-sixth century, they attempted to cut off their promontory to prevent the median Harpagus from capturing it, but allegedly they stopped on the command of the Delphic Oracle and instead surrendered. Cnidus was a member of the Delian League, but revolted in 412; despite the lack of walls, the Athenians failed in an attempt to retake it, and the city was later used as a Spartan naval base. The Athenians won an important battle at Cnidus in 394, but from 387 it reverted to Persian rule until Alexander the Great arrived in 334. In the Hellenistic Period, Cnidus was generally under Ptolemaic control; it later provided naval assistance to Rome and Rhodes against Antiochus III the Great.

Carthage, Carthaginians

Founded around 814, Carthage enjoyed an ideal geographic position at the center of the southern Mediterranean. Wealth came from the Carthaginians' commercial enterprise and their fertile North African hinterland. By the mid-fifth century Carthage dominated not only the peoples there, called Libyans by the Greeks, but also many Phoenician sister-colonies on the coasts of North Africa, Sardinia, Corsica, and Sicily.

Carthage evolved a political system rather like those of Greece and Rome: elected magistrates (headed by two *shophetim*, "sufetes"), a senate of leading men, and a legislative and electoral citizen-assembly—although sufetes and senate together could ignore this. While loyally maintaining ties, especially religious, with its mother-city Tyre, Carthage was equally open to other influences, from Libya and Numidia nearby, Egypt, and Greece. By 340, Carthage was similar enough to a Greek city-state for Aristotle to include it in his *Politics*—unlike Rome.

Carthage's many wars are not always recorded in detail, but it is known that from the 550s on Carthage projected military and naval power well beyond North Africa, waging campaigns in Sardinia and Sicily to impose firm control over their areas of Phoenician settlement: in Sardinia chiefly the productive south and southwest, in Sicily the island's west with centers like Panormus, Motya, and Drepana. Carthage also controlled the coastlands of Lepcis Magna, Oea, and Sabratha, in today's Libya. In its own region, though, Carthage endured repeated revolts by its oppressed Libyan subjects; and in Sicily its position and ambitions frequently collided with those of powerful Greek states like Acragas and Syracuse.

Carthaginian citizens normally did not fight in land wars, though for major expeditions and emergencies they did, and senior officers at all times were Carthaginian. Citizens manned the fleets, which could be large. In the fifth and fourth centuries, the regular warship was the trireme, requiring some 170 oarsmen and a body of marines; in the early third, Carthage adopted the new and larger quinquereme, which embarked 300 oarsmen and several dozen soldiers. Transports for horses and munitions also participated

in expeditions, but sea-battles were few. Significantly, the Carthaginian navy played a subordinate role before the first war with Rome.

On land, Punic armies (“Punic” is the Roman term for “Carthaginian,” still used today) were formed mainly of Libyan conscripts and overseas professional troops, notably Spaniards, Campanians from Italy, Gauls (from southern Gaul and northern Italy), Numidians (famous especially for hardy Cossack-like horsemen), and—from the 340s to the 240s—Greeks. They fought in their own units and with their own equipment, which made their generals’ leadership tasks especially demanding.

Though lesser Greek cities sometimes preferred Carthage as hegemon, its Sicilian wars proved generally futile. In 480, Hamilcar’s great expedition was destroyed; in 409, 406–405, and again in 396, Punic armies were ravaged by plague that spread back to Carthage. Despite intermittent victories in the many wars against Syracuse from 409 to about 368, in the end Carthage remained mistress only of Sicily’s west as before. Fresh initiatives in the 340s and in 312–306 did no better. Timoleon destroyed a splendid Punic army at the River Crimisus in 341; in 310–307, Syracuse’s new ruler Agathocles countered the siege of his city by invading Libya and bringing Carthage itself close to ruin. Then in 278–276, a coalition under Pyrrhus of Epirus came close to driving the Carthaginians out of the island, only for Pyrrhus’ allies to fall out. The status quo was restored.

This lasted barely 12 years. In 264, Carthage clashed with a newcomer to Sicily, the Roman Republic—even though both began by rescuing Messina, at the straits of Sicily, from attack by Syracuse. The First Punic War proved a new kind of conflict. Huge sea-battles were fought, and usually lost by Carthage (save for two in 249, not followed up). Libya was invaded in 256–255, though the Romans under Regulus were crushingly defeated. In 241, Carthage had to accept peace with the total loss of Punic Sicily—followed in 237 by a Roman grab of Sardinia.

Under the leadership of Hamilcar Barca, Carthage opened a new military era by conquering and exploiting the riches of southern Spain (237–219), but reacted to feared Roman interference in 218 by launching the famous invasion of Italy under Hannibal, Hamilcar’s son. The Second Punic War temporarily gave Carthage mastery over almost all the western Mediterranean: Rome and Rome’s loyal Italian allies were virtually encircled, and Syracuse and Macedon became Carthage’s allies. But Hannibal’s final defeat in 202, by Scipio Africanus, ended its role as a great

power and confined the city to Libya. Carthage was intermittently harassed by the now powerful Numidian king Masinissa (203–149) who annexed one sector of Punic territory after another, and finally antagonized Rome by resisting them in 151. From 149 to 146, the Third Punic War was essentially Rome's siege of Carthage, ending when Scipio Aemilianus (Africanus' grandson) stormed, sacked, and burned the ancient city.

Carthaginian War, First (480)

Causes

By 490, Carthage dominated most of western Sicily, not only its Phoenician-founded cities like Panormus and Motya but nearby Elymian centers like Segesta. Its own affairs were run by the Magonid family, whose military ancestor Mago had made himself its effective ruler. For obscure reasons Carthage wrangled with the leading Greek city-states Acragas, under its ruler Theron, and Syracuse, ruled by his son-in-law Gelon. They were also at odds with Anaxilas, tyrant of Rhegium and Messana at the straits of Sicily, and his son-in-law Terillus whose overthrow as tyrant of Himera in northern Sicily had been orchestrated by Theron. The trigger for the war was Terillus' appeal to Carthage's Magonid leader, his guest-friend Hamilcar, for help.

Course

After three years' preparation, in 480, Hamilcar launched a powerful

expedition to restore Terillus and subdue Sicily (this peril prompted Gelon to refuse aid to Greece against Xerxes). Hamilcar's forces are no doubt exaggerated by Herodotus and Diodorus, our main sources—300,000 soldiers (mostly mercenaries from all over the western Mediterranean), 200 warships, and 3,000 transports—but undoubtedly were large. Though damaged by a storm, the expedition put in at Panormus and then besieged Himera by land and sea. Hamilcar's curiously lethargic leadership allowed Theron and Gelon to arrive, relieve Himera, and join battle with him outside his camp. According to Diodorus, a cavalry contingent supposedly from Carthage's Greek ally Selinus, but really from Gelon's army, entered Hamilcar's camp, killed him as he made sacrifices for victory, and set his fleet on fire while the battle was going on. Herodotus' version, from Carthaginian informants, is that on seeing his army defeated Hamilcar leapt into his own sacrificial fire.

Consequences

The outcome was anticlimactic. Acragas and Syracuse did not attack Panormus or other Carthaginian possessions in Sicily. Anaxilas remained master of the straits of Messana and Carthage made no attempt to retrieve the situation or avenge Hamilcar. Peace prevailed for the next 70 years.

Carthaginian Wars (409–367)

Causes

The reasons for the outbreak of this series of wars in 409 are obscure. As the first war-leader was Hannibal, elderly grandson of the Hamilcar defeated in 480, Diodorus' sources held that revenge was the motive, but this looks

inadequate to explain the sweeping ferocity of his campaigns—and his utter obliteration of Carthage's one-time ally Selinus. The Carthaginians, still under Magonid dominance, had made themselves masters of their Libyan hinterland during the previous generation; with Sicily's Greeks weakened by constant struggles and by the great Athenian invasion of 415–413, quite likely they now reckoned that they had the means to impose hegemony over the whole island if they acted with massive force.

Course

Aided by his kinsman Himilco, Hannibal wrought havoc in 409 and again in 406–405. Selinus and Himera were destroyed, temples and tombs desecrated. In 406, the great city of Acragas was sacked and in 405 Gela and Camarina in the southeast. Syracuse was menaced. The temple sacrileges nonetheless had consequences (so people felt)—Hannibal and many in the Punic (Carthaginian) armies perished of plague. It saved Syracuse from assault and then crossed to Libya and Carthage. Yet the new tyrant of Syracuse, Dionysius I, had to concede a peace (405) that left Carthage in control of half the island. This was the high point of its rule there.

It did not last. Dionysius rebuilt Syracuse's military strength to renew war in 398 with 83,000 troops and elaborate siege-engines and artillery. An epic siege of Motya ended in the fall and ruin of the island city; Carthage replaced it with Lilybaeum on the nearby coast. In 396, Himilco struck back with more devastation—Messana destroyed, the Syracusan fleet beaten, Syracuse itself now besieged—only for his army again to disintegrate into plague so catastrophic that he fled home with his citizen troops, abandoning the rest to death or Dionysius. The debacle was so complete that he killed himself and the Magonids fell from power.

Another bout of warfare in 393–392 under a different Mago ended in a treaty conceding central Sicily and its Sicel communities, like Enna, to Syracuse. Carthage soon judged the settlement unsatisfactory. Dionysius proceeded to fashion a Syracusan empire not only over eastern Sicily but also over much of nearby southern Italy, then started to court west-Sicilian cities under Punic control. Mago therefore was sent over in 383 to confront him. This war is recorded only sparsely: Mago lost his life in battle, but the Syracusan tyrant overconfidently rejected Carthage's overtures, opted for battle at a place called Cronium, and was routed. He now had to accept terms confirming Carthaginian control west of the Halycus (Platani) River

and requiring him to pay 1,000 talents (6 million drachmas).

The Carthaginians remained watchful. Around 378, they refounded a town, Hipponium, in south Italy that Dionysius had destroyed 10 years before, a challenge to his power in that region. All the same they themselves were weakened by Libyan rebellions, the continuing ravages of plague, and finally a great fire in their dockyards. Much encouraged, the aging Syracusan leader renewed hostilities in 368. His fleet moved against the fortress port of Drepana north of Lilybaeum, but was annihilated in one of these wars' few big sea-battles. With his death in 367 the war faded, although it seems peace was formally made only a few years later by his son and successor Dionysius II.

Consequences

The damage and suffering inflicted by 40 years of intermittent warfare fell on Carthage and Libya no less than on the unfortunate Sicilians. Heavy defeats, political upheavals, epidemics, and Libyan revolts (with Carthage besieged for a time in 396) were all direct or indirect results. The gains were limited too—at the end of the final war, Carthage's position in Sicily was virtually unchanged. Even though the Halycus line gave Carthage more of Sicily than she had had in 480 or 409, it was far from the extensive hegemony apparently aimed at in 409 and briefly won in 405.

Carthaginian Wars (345–275)

Causes

Dionysius II's fall in 357 led to anarchic strife in Greek Sicily, but Carthage held aloof until 345 when a pro-Carthaginian leader at Syracuse sought help against the returning tyrant. Carthage used this appeal to launch a new attempt to extend its power in Sicily, which led to a series of wars over the following 70 years.

Course

In 345, Carthage dispatched a strong army (60,000 men, including many Greek mercenaries), which briefly occupied part of Syracuse for a year or so. Yet again the enterprise faltered, for from Syracuse's mother-city Corinth came a bold leader, Timoleon, to unite the warring Sicilian Greeks in resistance. The first Punic (Carthaginian) army withdrew (343); when a second, brilliantly equipped and headed by 10,000 Carthaginian citizen troops arrived in 341 (or perhaps 340), it fought Timoleon's smaller force at the River Crimisus (probably the Belice) near Selinus and was almost annihilated. Timoleon used the restoration of peace to revive the ravaged Greek states and repopulate them with 60,000 settlers from Greece.

As a result, by 316 the Carthaginians again faced a resurgent Syracuse. Its populist despot, Agathocles (born, incidentally, in Sicily's Punic west), regularly massacred aristocratic and other opponents at home, steadily pushed Syracusan influence over the other Greek cities, and in 312 invaded the west. This touched off a colossal struggle in which several Greek cities, Acragas among them, either allied with Carthage against Syracuse or struck out for themselves. With Syracuse under relentless siege, Agathocles turned the tables by sailing with an invasion force to Libya (his departure date is known: August 14, 310). There he wrought havoc, defeating armies sent against him, looting and ravaging inland territories, and stirring up Libyans to rebel. Carthage's fortunes looked so bleak—in Sicily, too, the siege of Syracuse was broken—that (according to Diodorus) a mass holocaust of 300 aristocratic children was performed to appease the baleful gods. Then in 308 a disgraced general, Bomilcar, attempted a failed but bloody putsch inside the city. At the same time, Agathocles was joined by a new army, brought from Cyrene by a potential rival named Ophellas whom he swiftly murdered.

Thus reinforced, Agathocles was able to capture Carthage's loyal neighbors Utica and Hippou Acra. Although he returned to Sicily early in

307 to deal with reverses inflicted on Syracuse not by Carthage but by an Agragas-led Greek coalition, his Libyan invasion rolled on and extended even into Numidia. All the same its time was nearly up. The Carthaginians reorganized their forces, defeated the scattered invasion armies, and then defeated Agathocles when he hurried back. This prompted the unsentimental tyrant (now calling himself “king”) to desert his troops—and two sons whom the troops soon killed—to hasten home alone. In 306, Carthage made a remarkable peace with him: the Halycus border was confirmed, he was paid a large subsidy, and his domination over virtually all the rest of Sicily was accepted.

Agathocles’ empire, which in time extended to southern Italy like Dionysius I’s, and even to Corcyra, collapsed after his death in 289. Once more Sicilian anarchy and inter-Greek warfare erupted, finally drawing Carthage in when Syracusan forces attacked its territory. Again besieged, Syracuse attracted the help of Pyrrhus, the ambitious king of Epirus who in 280 had crossed to Italy to aid Tarentum against Rome. Losing interest in that, he sailed to Syracuse (278), organized a fresh Greek coalition, and in two campaigns seized the entire Punic west except for the fortress-ports Lilybaeum and Drepana.

Carthage itself was threatened with a new Greek invasion, but the crisis passed. Pyrrhus’ regal high-handedness toward his Sicilian allies turned them so bitterly against them that he had to abandon his venture and return to Italy (276/5). The war ran down: Syracuse came under the rule of an intelligent general, Hieron, who preferred peace with Carthage so that he could deal with a dangerous local enemy, Messana, now occupied by Campanian ex-mercenaries of Agathocles.

Consequences

The series of wars over 70 years effectively weakened Carthage’s position in Sicily—leaving it with little except Lilybaeum and Drepana. While the war slightly increased Syracuse’s power from its start point in 345 (the peak under Agathocles was not permanent), it also created instability in Sicily, including Messana. When a new war in Sicily sparked by a mercenary occupation of Messana drew Carthage in 11 years later, her main enemy would not be a Sicilian state but the Roman Republic.

Cassander (d. 297)

Son of Antipater, born no later than 354. He did not participate in Alexander's campaign, remaining in Macedonia until he was sent to Babylon in 324, to answer charges brought against Antipater. There are references in the sources to hostility between Cassander and Alexander, and after the king's death, rumors circulated that Cassander and his brothers had been involved in a conspiracy to poison the king. However, it is more likely that this hostility originated from the other Successors who later became Cassander's rivals. He married the half-sister of Alexander the Great, Thessalonice, and they had three sons, Philip IV, Antipater, and Alexander V.

Just before his death Antipater turned over the guardianship of the kings, Alexander IV and Philip III Arrhidaeus, to Polyperchon rather than to his own son. Cassander and his supporters consequently plotted to overthrow Polyperchon and renewed an alliance with Antigonus I Monophthalmus and Ptolemy I Soter. Together they were gradually able to wrest power away from Polyperchon. Many of the Greek cities remained loyal to Cassander, and he controlled Athens until Demetrius I Poliorcetes took it in 307.

Cassander also continued the bitter hostility that had existed between Olympias and his father. He formed a short-lived alliance with Eurydice, who turned over the guardianship of Philip III Arrhidaeus to him, but the royal couple were soon defeated and executed by Olympias. Olympias proved to be a formidable enemy, having 100 of Cassander's supporters executed, including his brother Nicanor, and even went as far as to desecrate the grave of their brother Iolaus. Cassander besieged Olympias at

Pydna and forced her to surrender, after which he gained control over Alexander IV and his mother Roxana. Cassander was responsible for bringing about Olympias' execution, and ambitious for the kingship, he later had Alexander IV and his mother murdered as well. Soon after, he convinced Polyperchon to murder Alexander the Great's other child, Heracles, who remained one of the last candidates with a legitimate claim to the throne. This allowed Cassander to assume the kingship of Macedonia, declaring himself king in 305. He was a member of the coalition that formed to remove Antigonus and his son from power, but was not actually present at the battle of Ipsus in 301. He ruled Macedonia until 297, when he died of an unknown illness, possibly tuberculosis.

Casualties

Casualty numbers for ancient warfare are notoriously difficult to determine, partly because they may have been hard to find out even at the time. Greek armies did not have the sort of rigorous, centralized record keeping that modern armies do. Nevertheless, since proper burial of the dead was considered important, armies did regularly agree to a truce after battles to allow each side to gather up and bury their dead. At this point, an accurate count could be made, though whether it included subordinate groups such as light-armed troops or Spartan Helots would be moot. Losses at sea would be extremely difficult to count. Athens did regularly erect lists of each year's war dead, but whether those included were only hoplites or whether they included all fighting men, including sailors, is not certain, and may well vary between lists. In a special case, the number of dead might be well

known: an example is the 192 Athenian dead at the battle of Marathon in 490. But this would be a rare example.

In general, historians do not trust casualty figures (or, indeed, numbers generally) in ancient sources. Xenophon even contradicts himself over the number of ships lost at the battle of Arginusae in 406; the number of sailors lost will have been unknowable. Athenian deme records might have noted citizen deaths, but the deaths of foreigners or slaves who rowed in the fleet will nowhere have been recorded. Often ancient writers may exaggerate the scale of a disaster for dramatic effect: Thucydides' description of the total destruction of Athens' Sicilian expedition in 413 may be a case in point: if Thucydides account is taken at face value, it is hard to see how Athens managed to fight on for another nine years.

Nevertheless, historians have attempted to make some judgments. Peter Krentz has reviewed casualty figures in the sources for hoplite battles between 479 and 371, arguing that the ritual gathering of the dead did provide good initial data. Krentz' conclusion, which has been widely accepted, is that between 10 and 20 percent of the losing side were killed, with an average around 14 percent. Even the victorious side lost between 3 and 10 percent killed, for an average of around 5 percent. We cannot put too much trust in these figures, but they do suggest reasons why hoplite battles were rare: the costs were just too high. These numbers represent not years of fighting, as we are accustomed to in modern warfare, but the losses of a few hours of battle. A city-state could not sustain such losses regularly. A significant disaster, such as that of the Argives at Sepeia in 494, would take a generation to make up (which is why 30-year truces were often favored).

Even in the case of hoplite battles, the recorded numbers of dead probably do not include wounded soldiers who died later, away from the battlefield, and we rarely if ever have figures for the number of wounded; prisoners are also very hard to quantify. Much Greek warfare took the form of skirmishing, by light-armed troops, cavalry, and sometimes hoplites. It is likely that casualties in these operations were much lighter than in full-scale battles, yet repeated year in and year out the effects on communities may have been considerable. But it is significant that agricultural ravaging—a form of warfare designed to humble an enemy while sustaining few casualties—was one of the most common forms of Greek warfare.

As noted above, losses at sea are even harder to quantify than on land. But Barry Strauss has argued that they may not have been as high as we

imagine. Ancient warships did not sink when disabled, but rather settled in the water and slowly broke up. This allowed plenty of time to rescue sailors clinging to pieces of wreckage in the water unless a victorious enemy prevented it or, as at Arginusae, bad weather made it impossible. Strauss argues that it was aversion to losing citizen sailors that pushed Athens toward naval tactics that emphasized clever maneuvering of ships rather than ship-board battles that left rowers highly vulnerable to enemy boarders.

In the Hellenistic Period, when kings could assemble great armies from large empires and with many mercenaries, the scale of losses was potentially greater. Soldiers in a Hellenistic phalanx were more lightly armored than their hoplite predecessors and were equipped with a long *sarissa* useless once the phalanx broke up. Hoplites, though they preferred to fight in a cohesive phalanx, could offer resistance even when thrown into disorder. When a Hellenistic phalanx fell apart, the result could be carnage, as in the 8,000 Macedonians killed fighting Flaminius' legions at Cynoscephalae in 197. They were not buried until the following year.

Catalogus (Katalogos)

Catalogus (Greek: *katalogos*) was a technical term used at Athens in the administration of military service. It applied to an official register of men aged from 18 to 60 years, liable, because of their property holdings, for service as hoplites. There was also a separate *catalogus* for those liable to cavalry service. Those liable were entered on the *catalogus* under the year of their birth, which was recorded under the name of the Archon of that year. The requisite number of troops for a campaign was reached by calling up sufficient age groups.

Hoplites were sometimes referred to as serving *ek katalogou*, “according to the *catalogus*” (Thucydides 6.43, 7.16). This could have the implication (e.g., Aristotle, *Constitution of Athens* 26.1) that hoplites drawn from the upper classes of citizens were of better quality than other types, such as mercenaries, volunteers, or metics.

Cataphractoi

A type of heavy cavalry, with both horse and rider fully armored, probably originating in the central Asian steppes, and later extensively used in the Near East. The term *cataphractoi* or “cataphract” (lit. “completely enclosed”) does not appear until the Hellenistic Period, although armored cavalry and chariotry existed from at least the second millennium. The difference between earlier armored cavalry and the cataphract lay in the type of armor worn. Livy (35.38) describes Seleucid cataphracts as wearing breastplates, while Plutarch writes that at Carrhae (53) both horse and rider were clad in plates of armor. In the later Roman period, Ammianus Marcellinus and Julian both compare the armored cataphract to a (bronze) statue—clearly a reference to the layers of armor covering the body of horse and rider (Ammianus, *Histories* 16.10.8, Julian, *Orations* 2.57.C). The most detailed

account of the cataphract's equipment comes from Heliodorus' *Aethiopian Story* in which he describes the armored cavalry of Oroodates (9.14–15). Heliodorus also likens the cataphract to a statue, stating they “look just like a man of steel, or a hammer-worked statue come to life.”

The primary offensive weapon of the cataphract was a long, solid thrusting lance. These heavy lances were not used only against infantry—third century CE Sassanid reliefs at Firuzabad and Naqsh-e Rostam show armored horsemen engaging in what could be interpreted as an early form of jousting. The other offensive weapon of the cataphract was his armor-clad horse. The cataphract horse had to be a physically imposing animal: not tall or particularly fast, but powerful—robust and stocky like the Nesaean horse. Horse and rider worked in a controlled, methodical manner with the occasional burst of speed.

Catapult (*Katapeltes*)

A weapon operated by a crew of several men that hurled projectiles, either arrows or stone balls, over long distances. Catapults were named after the type of projectiles, the size of the arrow, or the weight of the stone ball. There were two types of power sources: tension, generated by a normal bow, and torsion, generated by twisted bundles of ropes. Torsion power was more effective. Catapults were mostly made of wood with working parts of metal; the twisted bundles of ropes in torsion catapults were made of human or animal hair or animal sinews. Catapults can be regarded as the ancestors of modern artillery.

Catapults were initially antipersonnel weapons or were fired against targets such as siege-towers or ships. They were also used to attack the battlements or to defend city walls during sieges—but not for some time to breach city walls—in field battles, and on board ship in sea-battles. From

around the third century, catapults seem to have been powerful enough to cause some damage to walls, but presumably were still used for some time as a supplement to rams and tunneling to create a final breach. Catapults could be dismantled so as to transport them, but were unsuitable for ad hoc combat. Harsh and humid weather conditions had an adverse effect on the twisted bundles of ropes. Catapults were technically advanced and expensive military equipment.

Diodorus attributes the first development of the catapult to the reign of Dionysius I in Syracuse, Sicily, in 399. This could refer either to tension or to torsion catapults. Although modern works sometimes assume that the *gastrophetes* (a tension weapon probably similar to a large crossbow) is the most likely candidate, there is no evidence to support this. Catapults are attested for Athens in inscriptions of the first half of the fourth century and by literary sources for the Macedonians in the mid-fourth century; but the power type is not specified. Catapults were more often mentioned by literary sources for Alexander the Great's war against the Persian Empire, especially in his sieges (e.g., 332 at Tyre). In the third century, torsion catapults were common in the Mediterranean area.

The history and technical line of development for the catapult are uncertain for the Classical and Hellenistic Periods. Contemporary fourth and third century sources are rare and supply little historical or technical detail. Most information is transmitted in much later sources of questionable reliability, and therefore difficult to assess. Archaeological finds of complete catapults or parts are also rare, because their organic and metal components tend to decay. There are currently none at all from the fourth century and only one from the third century. The most helpful surviving sources are the books on building catapults and war machines by Philo of Byzantium (third/first century), Biton (third/second century), Vitruvius (first century), and Hero of Alexandria (first/third century CE)—all translated in Marsden (1971).

Cavalry

Most of Greece is not well suited to cavalry. Rocky and mountainous, only the wide grazing plains of Macedonia, Thessaly, and to a lesser degree, Boeotia, encouraged large-scale *hippotrophia* (horse raising). From the Mycenaean Period to the Hellenistic Period, the functional importance of cavalry in warfare fluctuated greatly, reaching its zenith in the fourth century cavalries of Philip II of Macedon and his son, Alexander III (the Great). Cavalry in the Greek world did not come into its own until the Classical Period, and even then tended to play a tactically subordinate role to the infantry armies of hoplites fighting in close formation. Before Alexander the Great, battles were won or lost by the infantry. Philip II and Alexander the Great's victories were case studies in how to use cavalry in close coordination with infantry and auxiliary forces. For the Successors in the Hellenistic Period, however, this tactical success would rarely be repeated.

In the Mycenaean Period, we know that the great warlords of Greece used horses in a military capacity, but only with chariots. However, in the Homeric epics the chariot serves as a means of transporting the hero to and from the battlefield. Otherwise, he fought on foot.

Vase paintings of the seventh and sixth centuries depict two distinct types of horsemen: (1) infantrymen carrying hoplite shields and (2) unarmored youths engaged in cavalry action. Most scholars believe that the first represents a mounted hoplite, a heavy-armed infantryman who rides his horse to the battlefield, then dismounts to fight on foot, analogous to the function of chariots in Homeric warfare. The young men of the second type might be our earliest examples of true cavalry in the Greek world. Judging by artistic representations, the Assyrians had true cavalry, that is, men fighting on horseback, at least two centuries earlier. However, it is possible

that the Greek youths are squires for the mounted hoplites and as such only saw limited action in battle.

Aristotle (*Politics* 1289b) refers to emerging cavalry powers in the Archaic Period, notably Chalcis and Eretria on the island of Euboea; Magnesia on the Maeander in Asia Minor; and Ionia. He links the importance placed on cavalry with oligarchic states. It should be noted that in fact *hippeis*, the Greek word for horsemen, almost always refers to the elite classes. Only they could afford the enormous cost of maintaining horses. However, this does not prove that these men actually fought as true cavalry, only that they possessed great wealth and status. For example, the second highest census class in the Solonian constitution in early sixth century Athens were called *hippeis*, but there is scant evidence that this meant anything other than that they could afford to own a horse. At the battle of Marathon in 490, Athens' levy included no cavalry at all. They were all hoplites or light-armed troops. It is quite probable that if Athens had a cavalry, it was composed of mounted hoplites or that it was so small a force (under 100) that it stood little chance against the more numerous and formidable Persian cavalry. On this occasion, the Athenian *hippeis* would have served as scouts or messengers or fought with their tribal units in the hoplite ranks, as was expected of all Athenian citizens who could afford hoplite armor. The failure of the Persian cavalry to play a more active role in the battle continues to be a point of debate among military historians. Another example is Sparta whose early fifth century force of *hippeis* appears to be a royal guard of 300 hoplites, not cavalrymen (although they may have been in the seventh century). In fact, Thucydides (4.55.2) informs us that Sparta did not organize a cavalry until 424, seven years into the Peloponnesian War. Relying upon others to provide cavalry support, like their Boeotian allies, Sparta felt no compelling need to field a cavalry when their feared hoplites usually settled the issue on the battlefield. In the fifth century, cavalry did not win or lose battles; hoplite phalanxes did. However, they were not unimportant in Greek warfare. They excelled in scouting out unfamiliar terrain; skirmishing against detached forces; providing cover for their retreating comrades; or pursuing an enemy put to flight. If the opposing force had cavalry, their primary mission was to engage it in a preliminary clash and to prevent it from approaching the vulnerable right flank of their own hoplite phalanx (unprotected by the hoplite shield, always carried on the left arm). The one thing that Greek cavalry never did

was to charge the fixed hoplite ranks of a phalanx—not even Alexander the Great risked full frontal assaults. Only in the era of the cataphract was this tactic viable (see later).

The Thessalians were by consensus the finest horsemen in the Greek world, followed by the Macedonians and Boeotians. By the mid-fifth century, the southern Greeks began to reassess the importance of cavalry. In particular, Athens created a cavalry to counter their mainland rivals, the Thebans. This is the era of the Delian League, soon to be transformed into the Athenian Empire. Athens needed an imperial cavalry to fulfill its territorial ambitions in central Greece. Xenophon notes that in the fourth century it cost the state 40 talents a year to maintain them (*Cavalry Commander* 1.19). By the outbreak of the Peloponnesian War in 431, Athens could field a 1,000-man force, supplemented by 200 mounted archers (Thuc. 2.13.8). Athens took great pride in its new cavalry: its youthful *hippeis* cavalcade with prancing horses along the Panathenaic frieze of the Parthenon on the Acropolis (see illustration), a scene that caught the approving eye of Xenophon (*On Horsemanship* 11.9). The greatest comic writer of the day, Aristophanes, wrote a play about them in 424 called *Hippeis*. The Athenian cavalry would prove its worth during the long and grueling Peloponnesian War, defending Attica by harassing the invading Spartans, Boeotians, and Megarians and campaigning in the Peloponnese (a cavalry victory at Solygeia: Thucydides 4.42–44) and in the northern Aegean. Up to 300 Athenian cavalymen were regularly transported to distant battlefields, and it could be argued that the Athenians might have avoided disaster in the Sicilian Expedition (415–413) had their Sicilian allies been more forthcoming with promised money and cavalry support or if Athens had committed a larger cavalry force of their own to counter the large and effective Syracusan cavalry. However, Athens could not send cavalry reinforcements greater than 250 men in 414 because of the presence of a permanent Spartan garrison at nearby Decelea. Other western Greeks of Magna Graecia also began to develop serious cavalries at this time, notably, Taras (Tarentum) in southern Italy whose spectacular coinage from the fifth to the third century depicts the pride of place held by the young Tarantine horsemen in equestrian and martial poses.

Athenian cavalymen in the Panathenaic Procession, West Frieze, Slab 2, from the Parthenon. The Parthenon friezes were largely complete by 438 and the newly created 1,000-strong Athenian cavalry covers the entire West Frieze. The horse harness and the men's weapons were not carved but were included as bronze attachments, now lost. Located in the British Museum, London, United Kingdom. (Corbis)

The cavalries of Classical Greece were composed of young men of good families. It was a young man's game—the Panathenaic frieze and numerous cavalry reliefs confirm this reality—it was not an easy task to stay mounted without the foot support of stirrups, let alone hurl a spear from bareback. Xenophon encourages the soldiers of the Ten Thousand during the famous strategic retreat across Persian territory in 401 to take heart against the numerous Persian cavalry—as infantry, they stand on solid and stable footing against the charge, while the enemy horsemen struggle to stay mounted (*Anabasis* 3.2.18–19). Of course, this is what we would expect under the circumstances as he strives to bolster the fighting pluck of his men, but it is nonetheless a fair observation. Fighting on horseback takes equestrian skill developed by constant training and a high level of fitness. The Classical Period horseman had no stirrups, carried no shield, and wore relatively little or no body armor. A close inspection of the Panathenaic frieze shows some horsemen with body armor, others not (no doubt a case of artistic license). In a series of rapid approaches, they hurled javelins at the enemy lines, and then withdrew to let the hoplites decide the day. In the aftermath of the hoplite battle, they stood ready to pursue or to provide

cover. We are very fortunate to have valuable works on the cavalry written by Xenophon, a fourth century Athenian historian and former member of the Athenian cavalry. His technical treatises, *On Horsemanship* and *The Cavalry Commander*, detail the state of the Athenian cavalry in the fourth century, addressing topics like maintenance, training (e.g., the *anthippasia*, a mock cavalry battle of charging squadrons), equipment, and leadership.

The *Athenaion Politeia* (*Constitution of the Athenians*), attributed to Aristotle, supplements the information in Xenophon's treatises by describing the annual examination (*dokimasia*) of men and mounts by the Council of 500 (*Ath. Pol.* 49.1–2). Fortunately, our knowledge of the administration of the Athenian cavalry in the Classical and early Hellenistic Periods has been exponentially expanded by discoveries in the excavations of the Athenian Agora and the adjacent Ceramicus (ancient cemetery) over the past 50 years. In addition to inscriptions decreed by or for the Athenian cavalry, including one from 282/1 that reveals that the canonical 1,000-man Athenian cavalry had fallen to a mere 200 by this date and another that records a rare decree of the Athenian *prodromoi*, almost 700 lead cavalry tablets from the city's cavalry archives were uncovered dating to the fourth and third centuries. On each lead tablet were recorded (1) the name of the owner of the cavalry mount, (2) the horse's color and brand, and (3) its value in drachmas, 1,200 being the highest. They record the state's inspection process and the value of a cavalry mount as determined by the annual evaluation.

Philip II of Macedon, father of Alexander the Great, initiated major military reforms consonant with the consolidation of his throne and the expansion of his kingdom in the southern Balkans in the 350s and 340s. One of his signature reforms involved the infantry: he introduced a variation of the traditional hoplite phalanx by extending the length of the infantry spear, called a *sarissa*, up to 15–18 feet. On level ground, the Macedonian phalanx was almost unstoppable and a fearsome sight to behold, with its spear tips projecting beyond the front ranks in hedgehog fashion (see second illustration for Phalanx entry). This style would typify most armies of Hellenistic world.

The superiority of this new style of infantry would prove itself on the battlefield of Chaeroneia in 338. Perhaps from observing the brilliant tactics of Epaminondas and his cavalry commander, Pelopidas, while a hostage in Thebes, Philip grasped the tactical advantage of a close coordination of

infantry, cavalry, and auxiliary troops. Consequently, he reformed not only the infantry but also created a strike force of Companion cavalry with equestrian skills nearly equal to those of the Thessalians. With this new army, Philip defeated the combined forces of Thebans and Athenians in 338.

This pivotal battle in the struggle for hegemony of the Greek world marks the coming-out party of a young 18-year old Alexander. Most scholars believe that Alexander commanded his father's cavalry, as he always did later in his Persian campaigns, and that his charge was instrumental in the defeat of the elite 300 Theban fighters known as the Sacred Band (Diodorus 16.86.3, by implication). A few scholars, however, have argued that Alexander was leading an infantry force, and a reference to *sarissae* in Plutarch's life of *Pelopidas* (18.5) and *Alexander* (9) would lend some support to this interpretation. Recently, a physical anthropological examination of the bones of the fallen warriors of the Sacred Band, buried in the precinct of the Lion Monument at Chaeronea, has suggested that the fatal head wounds are consistent with the downward cut from a horseman's sword.

Another point of scholarly debate is whether the cavalry spear was also lengthened by analogy with the Macedonian infantry pike. Alexander deployed horsemen called *sarisophoroi* (*sarissa*-bearers) early in his campaigns, but it is not certain that he equipped his principal strike force, the Companion cavalry, with such lances. Experimental archaeology has led a number of scholars to test replicas of a "cavalry spear" ranging in length from 9 to 18 feet. Test simulations have shown that it is possible to wield a cavalry lance of great length in battle, and there is emerging consensus that Alexander (or his father) did introduce a cavalry *sarissa* of about 12 feet, thus longer than both the traditional javelin and the hoplite spear, but shorter than the infantry *sarissa*. The best example of a cavalry *sarissa* measuring about 12 feet can be seen on the famous Alexander Mosaic in the House of the Faun in Pompeii (see illustration in Alexander III [the Great] of Macedon, Invasion of Persian Empire entry).

Outside of the failure on the part of the Greeks to develop a stirrup, the most puzzling element of the Classical Greek cavalry is the apparent uninterest in protecting oneself with a shield. The western Greeks and Italian cavalries carried shields, but it seems not to have been adopted by cavalries in Greece until the early third century. The mounted warriors with shields on vase paintings in the Archaic Period are almost certainly

mounted hoplites, and in the fourth century Xenophon makes no recommendation to equip his troopers with shields, only protective left arm sleeves. Two theories for its introduction, both suggesting a date in the 270s, credit either Pyrrhus for borrowing the idea from his shield-carrying Tarantine cavalry allies in Italy or the Galatians who invaded the Greek world in 280/79 and whose cavalry carried round wooden shields or an oblong shield called a *thureos*. *Thureophoroi* can regularly be found in infantry and cavalry during the third and second centuries. One of the most dramatic artistic representations of the large round cavalry shield carried by Macedonians can be seen on the monument of Lucius Aemilius Paullus erected at Delphi after his victory over King Perseus of Macedon at Pydna in 168.

Alexander the Great's Persian campaigns demonstrate the decisive strike force capability of Macedonian Companion cavalry and Thessalians at every major battle. He himself commanded the Companion cavalry at the three major battles of Granicus, Issus, and Gaugamela. Unlike typical Classical armies with a ratio of 10 to 1, infantry to cavalry, Alexander deployed armies with a ratio of 6 to 1. The Successors would not sustain this high ratio of cavalry, and by the end of the third century, they fielded armies with numbers closer to the Classical levels. The prevailing emphasis was placed on infantry trained in Macedonian style and supported by large numbers of mercenary troops. The great age of cavalry warfare initiated by Alexander the Great seems to have faded away by the second and third generation of the Successors.

Cavalry, albeit assuming a secondary role, continued to play an important one in Hellenistic warfare. The Successor dynasts maintained elite cavalry units with royal-sounding names, and most Greek cities of the Hellenistic world supported citizen cavalries and militias, notably Athens. These were primarily intended for local and regional defense. The city *gymnasias* were as keenly interested in developing practical military skills as they were in cultivating the mind. The Achaean, Boeotian, and Aetolian Leagues, with collective resources at their disposal, fielded respectable, and at times, formidable cavalries in the third and second centuries. In the last decade of the third century, the cavalry commander, Philopoemen, took over an ineffective Achaean League cavalry and created a highly trained fighting force to combat the Spartan tyrant, Machanidas. Inscriptions attest the continued emphasis upon cavalry recruitment by the Boeotian League.

The Aetolian League projected their modest 500 man cavalry to regional and international theaters of war, for example, in the Social War (220–217); as mercenaries in the army of Ptolemy V at the battle of Panion (200); and as an ally of Rome, against Philip V of Macedon at Cynoscephalae in 197, even winning the praise of their enemy, Polybius, the foremost historian of the Hellenistic world and a cavalry commander of the Achaean League.

In the Hellenistic Period, two new cavalry types appear on the battlefield: the Tarantines and the *cataphractoi*, representing light and heavy cavalry, respectively. The Tarantines can be described as a light cavalry that hurled several javelins and carried a shield for protection. Military writers, like Asclepiodotus, Aelian, and Arrian, speak of two types of Tarantines: (1) the so-called true Tarantines, those who approach the enemy, hurl their javelins, and then gallop away, and (2) those who hurl their javelins as a prelude to engaging in close order combat. The presence of the shield would allow the Tarantines to dismount and fight on foot if necessary. Taras was a major cavalry power in Magna Graecia, with rich grazing lands for *hippotrophia*. Outside southern Italy, they first appear in Antigonos I Monophthalmus' armies in the late fourth century and thereafter become a regular fixture in Hellenistic armies into the second century, for example, Elis, the Achaean League, Sparta, and the Seleucid kingdom. Most scholars believe that in the wars of the first generation of Successors they may actually have come from Taras itself as mercenaries, but that by the third century the term "Tarantine" simply meant a style of fighting, not a certificate of ethnic origin. However, the ethnic connection with Taras may have abided well into the late third century, at least until the destruction of the city by Romans in 209. By the second century, however, the Tarantines and their commanders (Tarantinarchs) in Athens were Athenian citizens, and the reference applies to a particular type of light cavalry not to ethnicity. This is almost certainly true in other Greek states.

The term *cataphractoi* literally means "fully armored or covered," and this term was applied to both heavy cavalry and to ships. The cataphract represents the final stage in the development of heavy cavalry, whereby both rider and mount were encased in armor. They are mentioned prominently in the armies of Antiochus III the Great in 200 and they appear during the reign of his son, Antiochus IV Epiphanes in the 160s. Although effective as a strike force against Roman legions on the battlefield at

Magnesia in 190, the cataphracts of Antiochus III could not save the day after his other units collapsed. The limited deployment of this type of cavalry resulted from the high cost of maintenance, the lack of speed and mobility under the constraining weight, and to the stifling effects of hot climates. He was, however, the precursor to the medieval knight.

Celts, Invasion of Greece and Thrace (279/8)

In 279/8, a Celtic army under Brennus invaded Greece. These were Celts from somewhere to the north (possibly from around the Danube) whom the Greeks called Galatians (sometimes misleadingly translated “Gauls”). This invasion followed earlier plundering expeditions, partly encouraged by the death of Lysimachus and the resultant weakening of Thracian defenses. The first wave had overrun the army of Ptolemy Ceraunus, the man who had

ruthlessly fought and murdered his way to Lysimachus' throne and was now occupying Macedonia as well; Ceraunus himself was killed and beheaded. A Macedonian, Sosthenes, stopped this group, and they retreated.

Under a new leader, Brennus, the Celts set out to invade southern Greece. Pausanias, who gives us our main account, is keen to liken the threat to Greece to that posed by Xerxes in 480. With an army, according to Pausanias, of 152,000 infantry and 20,400 cavalry (with reserves), Brennus marched on Thermopylae, which was held by a coalition of Boeotians, Phocians, Locrians, Aetolians, Megarians, and Athenians. The defenders numbered around 24,000 infantry and 2,000 or more cavalry. The Greek cavalry and a thousand light-armed troops tried to prevent Brennus from crossing the Spercheius River, but were outflanked. Pausanias' account becomes worryingly Herodotean as he tells us that the Celts assaulted the defenders at Thermopylae in vast numbers, attacking without order like wild animals. Greek discipline and order, together with the Celts' lack of defensive armor, ensured countless losses for the barbarians, but only 40 dead for the Greeks. For their part, we are told, the Celts were so barbaric that they sought neither omens before the battle nor to recover their dead after it.

With the Celts demoralized, Brennus decided to split the Greek defenders by sending 40,000 infantry and 800 cavalry back to Thessaly to invade Aetolia from the northeast. They brutally sacked the inland city of Callion (or Callipolis), massacring the men, endlessly raping the women, pillaging sanctuaries and, according to tales the Greeks told, drinking the blood and eating the flesh of the plumper babies. The Greeks could see parallels here with the Persians in Phocis in 480, but in other ways the story differed. Like Xerxes, Brennus managed to surround the Greeks at Thermopylae; but unlike the Spartans, the Greeks in 279 prudently used an Athenian fleet to get away.

In any case, Brennus was not interested in Thermopylae. Instead he marched his army directly south through the passes leading to the rich plunder of Delphi. But as in 480, according to the story, Apollo promised to defend his property, and now indeed things began to go badly for the Celts. The Aetolians and some allies relentlessly harried the army that had displayed such brutality at Callion, so that fewer than half escaped back to Thessaly. But the army marching on Delphi suffered even worse, terrified by earthquakes, thunder and lightning, and undergoing a night of snow and

landslides. In the morning, the defenders attacked the Celts frontally, while local Phocians descended on their flank from Parnassus. There is dispute as to whether the sanctuary itself was pillaged. After fierce fighting, the Celts retreated, but the next night fell into panic and confusion (brought on, Pausanias suggests, by the god Pan), fighting each other as well as the pursuing Greeks. Continually harried, the army was destroyed on its march northward. Brennus was among the dead. The stories were no doubt exaggerated, but the terror for the Greeks was real. Afterward the Delphic Amphictyony instituted a panhellenic festival, the Soteria (“Salvation”).

Survivors from this campaign moved to Thrace, where they were defeated by the Macedonian king, Antigonos II Gonatas, at the battle of Lysimacheia in 277. Others crossed to Asia Minor, hired by Nicomedes I to take the throne of Bithynia. They settled in the area thereafter known as Galatia, but caused considerable trouble until finally defeated in 228 by Nicomedes’ grandson, Prusias I.

Cersobleptes (Reigned ca. 360–342)

Cersobleptes was the son of Cotys, king of the Odrysian Thracians. On his father’s death ca. 360, Cersobleptes was obliged to partition the kingdom with two rivals, Berisades and Amadocus, and ruled only the eastern part that bordered on the Thracian Chersonese.

Threatened by Philip II of Macedon’s expansion eastward from Amphipolis, Cersobleptes, along with the other two Thracian kings, made an alliance with Athens in 357. By 353, Philip had defeated the other Thracian kings and Cersobleptes relied more heavily on Athens, conceding to it possession of the Thracian Chersonese. He was at war with Philip in 352 and again in 346. In the latter year, he sent an ambassador to Athens in

an attempt to become a party to the Peace of Philocrates between Philip, Athens, and their allies. The exclusion of his ambassador from the oath-taking later became a subject of contradictory recrimination between rival Athenian politicians, Demosthenes and Aeschines.

That dispute had little practical consequence, since it so happened that Cersobleptes had been heavily defeated by Philip's forces the day before the swearing of the oaths. He remained subject to Philip until 342, when Philip deposed him.

Chabrias (ca. 420–357)

Chabrias, son of Ctesippus, was an Athenian *strategos* (general) active in the first half of the fourth century. Although his career spans a not very well-documented period of Greek history, there is enough evidence to demonstrate that Chabrias was an innovative land commander (especially of light troops) and also a successful admiral.

Chabrias was not from a wealthy background but married into the Athenian cavalry class—his father-in-law, Menexenus, is recorded as a phylarch (cavalry squadron commander) in 429—and amassed considerable wealth over his career. He owned a four-horse chariot team (a sign of major wealth) good enough to win its event at the Pythian Games in 374.

Chabrias first comes to attention in the ancient sources in Aegina where he successfully ambushed the Spartans and their allies using 800 peltasts. Placing his hoplites in the open to draw the enemy on, he then attacked with his hidden peltasts. Between 385 and 383, he ostensibly served as a

mercenary commander successfully helping the Egyptian rebel pharaoh, Akoris, repel sustained Persian attacks. However, his swift return to Athens when the Persians complained (379) about his activities in Egypt suggests he was there either in an official or semiofficial capacity, or at least with tacit support from Athens.

Chabrias reappears in our sources in 378 using peltasts to limit Spartan success in their invasion of Boeotia. However, his most important contribution to Athenian military success was at the naval battle of Naxos (376). Here, he decisively defeated the Spartans, restoring the vital grain imports on which Athenian survival depended. Along with Iphicrates, Chabrias helped lead a particularly successful expedition to Corcyra (373/2) but was killed at the sea battle at Chios in 357. Although Diodorus states that Chabrias was *strategos* at Chios, there is some doubt about this. He seems to have made the decision to stay with his crippled ship rather than surrender or abandon it, and died of his wounds.

Chaeronea, Battle of (338)

The battle of Chaeronea was fought in August 338 near the Boeotian town of the same name, located in the Cephissus valley northwest of Thebes. In this battle, Philip II of Macedon finally overcame Greek resistance and ended Greek hopes of independence from Macedon. Nevertheless, little

substantial information exists about the battle itself.

The context for the battle is the Fourth Sacred War, between the Amphictyonic League and Amphissa and its allies. After successful preliminary moves, including handing Amphissa over to Delphi, in 338 Philip moved against Athens. The Athenian orator Demosthenes rallied the city and allied with Thebes, blocking Philip's further advance.

The Macedonian army consisted of 30,000 infantry and 2,000 cavalry, led by Philip himself, and with his son Alexander (the Great) as a subordinate commander. The Greek forces were probably about the same number (although Justin claims they were greater). The bulk of the Greek army came from Athens (commanded by Chares and Lysicles), Thebes, and Achaia. Corinth, Chalcis, Epidaurus, Megara, and Troezen also supplied troops.

The battle was fought on the plain between the Cephissus River and a line of hills. The Greeks deployed facing north, the Athenians on the left, next to the hills, the Achaeans and others in the middle and the Thebans on the right, next to the Cephissus. The Macedonians faced south, with Philip probably commanding the right wing and Alexander the left, on the Cephissus. Although many scholars have assumed that Alexander commanded the Companion cavalry, some (e.g., Gaebel) argue that only a phalanx could have overcome the Theban Sacred Band. Although open to question, the traditional view fits with Alexander's later career and it is also perhaps more likely for Philip to place his heir with the cavalry rather than the infantry. In addition, analysis of the skeletal remains of the Sacred Band indicates wounds consistent with a downward blow from a man on a horse.

The battle demonstrates the professionalism of the Macedonian troops and commanders, the superiority of the Macedonian phalanx over hoplites, and the advantages of unitary command over a coalition. Philip feigned a withdrawal to draw the Athenians forward and when the Greek line was sufficiently dislocated, reversed the withdrawal, using the higher ground he had gained to add momentum to his phalanx. The Athenians broke, exposing the left flank of the Achaeans. On the Macedonian left, Alexander routed the Thebans and surrounded and destroyed the entire Sacred Band, thus exposing the right flank of the Greek center. Attacked from both sides, the Greek center rapidly collapsed. Although Philip did not pursue far, 1,000 Athenians were killed and 2,000 captured and the Thebans and Achaeans apparently suffered even more heavily. The lion monument still on the site

is supposed to mark where the Thebans are buried.

Although Philip imposed a relatively lenient settlement on Greece, he was now undisputed hegemon. Athens lost most of her remaining naval empire and Thebes was forced to accept a Macedonian garrison.

Chalcidian Confederacy

The Chalcidian Confederacy (also known as the Chalcidian League) was formed before 382, most likely in 432/1 when the inhabitants of several coastal cities moved inland to Olynthus in preparation for a revolt from Athens. As Olynthus was later the federal capital, this may have created the Confederacy. However, the only certainty is that it must have been founded before 382, when Acanthus and Apollonia appealed to Sparta to prevent forced enrolment into it.

The Confederacy seems to have been a true federal system, with citizens of the member states allowed to intermarry and own property in each other’s territory. The capital was at Olynthus, but the Confederacy had federal magistrates and an army contributed by the member states. The army probably had 1,000 cavalry, a large but unknown number of peltasts, and an unknown number of hoplites (Xenophon, *Hellenica* 5.2.14 has “at least 800” but this is very low and the text is probably corrupt). The quality

of the cavalry and peltasts was high, largely contributing to the Chalcidian success at Spartolus (429), Amphipolis (422), and the death of the Spartan Teleutias (381).

If founded in 432/1, the Confederacy's early years were spent resisting Athenian attempts to reestablish domination following the revolt of Potidaea and other cities. This revolt widened with Brasidas' successful campaign in 424–422, when many more cities joined their fellows (whether informally, or formally in a confederacy). In 392, "the Chalcidians" were allied to Amyntas III of Macedon—a feature of the Confederacy's history is swinging between alliances with Athens and Macedon. However, by 382, the Confederacy dominated large parts of Macedon, including Pella.

In 382, the growing power of the Confederacy led to appeals by Acanthus, Apollonia, and Macedon to Sparta. A large Peloponnesian League force was sent north and despite setbacks (including the deaths of Teleutias in battle and Agesipolis I of illness) Olynthus was forced to surrender and the Confederacy dissolved.

How long it remained so is uncertain—"the Chalcidians" enrolled as a group in the Second Athenian Confederacy in 378/7. The friendship with Athens did not last and the Confederacy, apparently now fully reconstituted, left when Athens made attempts to recover Amphipolis. The Confederacy allied with Macedon in 357/6 and was strengthened by Philip II giving it Potidaea and Anthemus. Around this time the Confederacy consisted of 32 cities.

Apparently at the height of its power, the Confederacy quickly collapsed when attacked by Philip II (349–348). He first secured the rest of the Confederacy by force or treachery and then attacked Olynthus itself. The city fell, betrayed by two prominent citizens, Lasthenes and Euthycrates, and by its cavalry. Philip destroyed it and permanently dissolved the Confederacy.

Although the region was prosperous from agriculture and commerce, and had good quality cavalry and light troops, the Confederacy was unable to protect itself from its large neighbor, Macedon, or the intervention of Sparta, although it had more success resisting Athens' ambitions in the region.

Chalcidice

A region in northeast Greece bordering Macedon and Thrace, the Chalcidice has three peninsulas; from west to east: Pallene, Sithonia, and Acte. Macedonian pressure and Greek colonization (from the eighth century) displaced many of the original inhabitants, the Sithonians, Edonian Thracians, but others remained and over time became culturally Greek. The first colonizer was the Euboean city of Chalcis, which gave its name to the region and founded around 30 cities there. Other notable colonizing cities were Eretria and Andros; Corinth founded only one, Potidaea (ca. 700), but it was an important city. The region was fertile, had good trade access into Thrace, and good timber and mineral resources. However, it was fairly continuously under pressure from its neighbors and larger powers.

The Chalcidice became subject to Persia in the lead up to the Persian Wars but after the Persian defeat joined the Delian League. However, later relations with Athens were fragile given Athenian ambitions in the region, first shown with the revolt of nearby Thasos (ca. 465), which forfeited its mainland possessions and was reduced to the status of a subject member of the League (ca. 463/2). The foundation of Amphipolis (437/6) was a very clear indication of Athenian intent and in 432/1, exacerbated by Athenian pressure on Potidaea over its continued links with Corinth, several cities in the region revolted from the Delian League. It is likely that these formed their own federal organization, the Chalcidian Confederacy, with Olynthus as its capital (although this may not have occurred until later). Potidaea was

captured by Athens (430) but the rebels strenuously resisted Athenian attempts to restore its position there during the Second Peloponnesian War. The rebels received a boost when other cities revolted from Athens during Brasidas' campaign (424–422). The Chalcidians made good use of their cavalry and light troops to repel Athenian attacks at Spartolus (429) and Amphipolis (422).

The history of the region from 432/1 (or at least sometime prior to 382) down to 348 is essentially that of the Chalcidian Confederacy. Successful expansion west, at the expense of Macedon, was ended and the Confederacy temporarily dissolved after a war with Sparta (382–379). Refounded, the Confederacy joined the Second Athenian Confederacy, only to leave in 357/6 after the Athenians signaled renewed ambitions in the area (including founding a cleruchy at Potidaea ca. 362/1). Alliance with Philip II of Macedon (356) brought temporary gains but in 349–348 Philip subdued the region, destroyed its capital Olynthus, and dissolved the Confederacy.

From this point, the Chalcidice was essentially part of Macedon. Some of its cities, such as Acanthus and Torone, continued as reasonably important centers. Potidaea, refounded as Cassandreia (316), soon became the most important city in the region. Other cities were founded there by the Hellenistic monarchs or their families, notably Antigonea “the Sandy” (Antigonos II Gonatas) and Stratonicea (Alexarchus). In 288, Demetrius I Poliorcetes fled Macedon ahead of Lysimachus and Pyrrhus and took refuge in Cassandreia, where his wife, Phila, committed suicide.

The Chalcidice passed under Roman control in 146. Famous Chalcidians include the philosopher Aristotle (from Stageira), the historians Aristobulus and Callisthenes (from Cassandreia and Olynthus, respectively).

Chalcis

Along with Eretria to the south, Chalcis (modern Halkida) was one of the two major towns of Euboea. It was situated at a strategically important site where the Euripus, the strait between Euboea and the mainland, is at its narrowest: even in antiquity, there was a bridge. There was Bronze Age settlement on the site, but little is known of its history in the succeeding centuries. Chalcis and Eretria were both great colonizing states, and the Chalcidice in northern Greece takes its name from Chalcis, which founded around 30 small cities there. The Greeks believed that in the eighth or seventh century, Chalcis and Eretria fought a great war over the Lelantine plain, which lay between them.

In 506, the Chalcidians supported the Spartan king Cleomenes in his campaign against Athens. After the Spartans retired, the Athenians crossed over to Chalcis, defeated it, and settled in its territory 4,000 Athenian cleruchs (settlers who retained their Athenian citizenship). Throughout the fifth century, Athenian cleruchs on Euboea were, it has been argued, crucial producers of grain for Athens. In 480, the Chalcidians manned 20 Athenian ships against the Persians. After the Persian War, Chalcis was a member of the Delian League, paying tribute of five talents. With the other Euboeans, Chalcis revolted against Athens in 446 and 411. When Athens came under the rule of the Thirty in 404, Chalcis provided a refuge for supporters of the democracy.

In the fourth century, Chalcis was a member of the Second Athenian Confederacy, before coming under Theban influence; in 348, some Chalcidians, at least, fought against Athens at the battle of Tamynae. But in 338, Chalcis was on the Athenian and Theban side against Philip II of Macedon at Chaeronea. In the Hellenistic Period, Chalcis became a

strategically important Macedonian naval base, and was one of Philip V of Macedon's three so-called Fetters of Greece. After the Second Macedonian War, Chalcis came under Roman control, but in 146 joined the Achaean League in fighting against Rome. After the Roman victory over the Achaeans, Chalcis' fortifications were demolished.

Champions, Battle of (ca. 547)

The "Battle of the Champions" was a rare attempt to resolve a dispute by combat between selected groups of soldiers instead of a battle between entire armies. Its failure helps explain why it was not apparently repeated in Greek warfare. The winner of this combat between 300 Spartans and 300 Argives was to gain the long disputed border region of Thyrae (or Cynuria). When night fell two Argives survived and one Spartan, Othyrades. The Argives went home for the night; Othyrades stayed, stripping the enemy corpses. Next morning both sides claimed victory—the Argives because they had more survivors, the Spartans because their man had remained in possession of the battlefield. The rules apparently did not cover this and the two armies then fought, with the Spartans winning. Othyrades is supposed to have killed himself out of shame at being the lone

survivor.

Chares (Active ca. 367–325)

Chares was an Athenian who held office as general (*strategos*) at least 17 times. He served in every major field of Athenian warfare from the Peloponnese ca. 367 to fighting against Philip of Macedon in 338. In the Social War (357–355), Chares shared the command in the Athenian defeat at the battle of Embata (or Embatum) in 356. He deflected prosecution by blaming his colleagues. He then hired his army out to a rebel Persian satrap, thus provoking an ultimatum from the Great King that forced Athens to end the Social War. Before this, he won a victory in Asia Minor that he allegedly claimed was equal to the battle of Marathon.

Consistently opposed to Macedonia, Chares was among the prominent Athenian leaders whose extradition Alexander the Great demanded in 335. Chares fled to Sigeum in Asia Minor and in 333–332 commanded a Persian garrison in Mytilene. However, he astutely abandoned the Persian side and is last heard of ca. 325 among the mercenaries who gathered at Cape Taenarum in Sparta rather than serve Alexander.

Chares was blamed for alienating Athens' allies by his unscrupulous methods of raising money to pay his mercenaries. His readiness to massacre opponents, as in his intervention in Corcyra ca. 361 or on his capture of Sestos in 353/2, has also blackened his reputation, perhaps unjustly in view of the conduct of Greek warfare at the time.

Charidemus (d. 333)

Charidemus, born at Oreus (Euboea) of low-class parents, was a mercenary slinger and peltast before becoming a highly competent and sought-after commander. His early career exemplifies a professional soldier's life: service under Iphicrates in Thrace (360s) and then on both sides in the wars between Athens and Amphipolis and the Chalcidian Confederacy (ca. 360). In the early 350s, he attempted to carve out his own principality in northwest Asia Minor but the Persians besieged him in Ilium. Forced to negotiate with the Athenian commander Cephisodotus, he promised to gain the Thracian Chersonese for the Athenians—but then joined the Thracian kings fighting them there, marrying the sister of one of them.

Charidemus later rejoined the Athenians and secured the cession of the Thracian Chersonese to them (357). It was most probably then that he received citizenship and other honors in Athens. In the Athenian phase of his career (now highly wealthy), he served as trierarch and was elected *strategos* (general) several times. He usually commanded forces of triremes and mercenary peltasts, serving against Philip of Macedon, especially in the Athenian effort to aid Olynthus (349–348). Details of his activities from 348–338 are lacking but after the battle of Chaeronea he was elected *strategos* in the short-lived period of Athenian determination to resist Philip to the end. On Philip's death in 335, he was linked with Demosthenes in the abortive uprising against Alexander and was therefore one of the 10 or more Athenian leaders whose extradition Alexander demanded. He was the only one of this group about whom Alexander did not relent, and went into exile. He took service under King Darius, who executed him for unwelcome but not entirely groundless criticism of the Persian forces.

Charidemus had a reputation for a wild personal life but he was a highly capable commander, who could keep the loyalty of mercenary troops and the confidence of the Athenian people.

Chariots

Chariots may have been introduced in Asia Minor ca. 1900 and from there spread to Greece. Although used in warfare in Asia Minor down to the Roman conquest, the military use of chariots in mainland Greek warfare was very limited. This was for several reasons: the rugged terrain in much of Greece is unsuitable for chariots; their high cost; and their relative ineffectiveness, especially in small numbers.

Despite the limited evidence, it appears Greeks used chariots in combat prior to the Dark Age. The standard chariot was two-wheeled and drawn by two or perhaps sometimes four horses. Its crew consisted of a driver and a warrior. The warrior used either a bow or a spear from the chariot and may well have dismounted to fight, particularly in rougher terrain. Chariots, and the horses that pulled them, were very expensive, and this essentially limited them to the palace societies of the Minoan and Mycenaean worlds. With the end of these societies, chariots basically disappeared from mainland Greek armies by ca. 1100.

In the Archaic and Classical Periods, Greek chariots remained the preserve of the wealthy and were used for ostentatious local travel and in sporting events. Two- and four-horse chariot races were popular events at several Greek games and entering chariots in these races was seen as a mark of major wealth. Hellenistic monarchies in Asia Minor, where the terrain was often better for chariots and they could be used in larger numbers, often adopted chariots in accordance with local practice. However, even there they seldom, if ever, played a decisive role in battle.

However, from the Classical Period on, Greek armies did sometimes fight against peoples such as the Carthaginians, Persians, and Indians who

used chariots. These almost always proved ineffective against heavy Greek or Macedonian infantry. One of the few successes was in 395 when Pharnabazus surprised 700 of Agesilaus' men out foraging. Although they hastily formed a phalanx, Pharnabazus used two scythed chariots to disrupt the formation and then finished them off with cavalry. However, this was not a typical battlefield situation. Greeks fairly easily dealt with the Persian chariots at Cunaxa in 401, and the Carthaginian chariots at the Crimissus River (ca. 341)—although they were aided by a storm at Crimissus. Alexander the Great had little trouble with the Persian chariots at Gaugamela (331) or the Indian chariots at the Hydaspes River (326).

Cheirisophus (ca. 440–400)

Cheirisophus was a Spartiate officer sent to serve with the Ten Thousand. After the treacherous seizure of the mercenaries' officers, Cheirisophus was elected as the new commander. He usually commanded the vanguard while the Athenian Xenophon commanded the rear. When the army reached Trapezus on the Black Sea Cheirisophus made a vain attempt to collect ships from the Spartan governor at Byzantium. He returned to meet the army at Calpe, where he died of natural causes.

Xenophon gives the impression that Cheirisophus was chosen for the

supreme command because he was a Spartiate, and that as a commander was no match for Xenophon.

Chersonese, Thracian

The Thracian Chersonese was the ancient name for the Gallipoli Peninsula (*chersonesos* means “peninsula” in Greek). About 50 miles (80 kilometers) long, the Chersonese runs southwest, parallel to the Asian mainland, and forms the northern shore of the Hellespont. Although the peninsula is only about 4 miles (6.5 kilometers) wide at its narrowest point near the neck, it has a total area of over 350 square miles (90,650 hectares), much of it highly fertile by Greek standards.

Because of the peninsula's status as a military zone in modern times, relatively little archaeological work has been done, but it seems probable that the inhabitants before the Greeks arrived were Thracians. Indeed, in the *Iliad* among those fighting for Troy Homer refers to Thracians living beside the Hellespont, though he also refers to Sestos, a Greek city founded by colonists from Lesbos, presumably in the seventh century. Lesbians also founded Madytos (modern Eceabat) and Alopecannesus (near Suvla Bay). Cardia, on the north coast near the neck of the peninsula, was founded by Miletus and Clazomenae. The small city of Elaious, near the tip of the peninsula (more or less at the site of the Turkish memorial to the Gallipoli campaign), boasted a sanctuary that was believed to be the Tomb of Protesilaus, the first Greek to die in the Trojan War. Thucydides believed that the Greeks had farmed the Chersonese to support themselves during the 10 years of the Trojan War.

Athenian interest in the area developed in the sixth century, probably driven both by its strategic location and by the grain-growing potential of the peninsula itself. Athenians took over the existing settlement at Elaious,

and in the late sixth century the Athenian aristocrat, Miltiades I, son of Cypselus, was invited to set up a personal fiefdom on the Chersonese in order to protect the inhabitants from marauding Thracians. In Herodotus' account, Miltiades was invited by a group of Thracians, the Dolonci, who lived inside the peninsula but were being pressured from outside by the Apsinthian Thracians. To help achieve this object, Miltiades built a wall across the narrow neck of the peninsula. The presence of the Dolonci is not surprising; Greek colonists often settled coastal areas, leaving the hinterland under indigenous control.

By the late sixth century the area was under Persian control, but the Athenians rekindled their interest in it in the fifth century. Sestos, captured by Xanthippus in 479/8, became the critical Athenian naval base in the Hellespont. In 447, Xanthippus' son Pericles fought a campaign to protect the Chersonese from renewed Thracian attack: he rebuilt Miltiades' wall and may well have settled Athenian cleruchs on land seized from Thracian inhabitants. The Greek cities of the peninsula—11 or 12, according to Xenophon, *Hellenica* 3.3.8–10—were all members of the Delian League, but after Pericles' campaign seem to have had their tribute greatly reduced, perhaps so that they could contribute directly to the defense of the Hellespont area. At the end of the century Alcibiades, in his second exile, retired to a fortress on the Chersonese; its location is unknown, but it may have been close to Aegospotami, a small town on the Hellespont coast where Lysander destroyed the Athenian fleet in the final battle of the Second Peloponnesian War (405).

In 398, a Spartan commander in the area, Dercylidas, once again built or repaired a wall across the peninsula. But for much of the fourth century the Chersonese was once again under Thracian control, as part of the expanding Odrysian kingdom, until Philip II of Macedon captured the area in 338. In 309, Lysimachus (one of the *diadochoi*, or Successors to Alexander) built his capital, Lysimacheia, at modern Bulair on the ridge on the neck of the peninsula, moving the population of nearby Cardia into his new city. In 277, Antigonos II Gonatas won a significant victory over the Gauls at Lysimacheia. During the Hellenistic Period ownership of the Chersonese swapped between Macedon, Syria, Egypt, and Pergamum. The last king of Pergamum, Attalus III, willed it to Rome as part of his possessions in 133.

At some time in antiquity Sestos' fine harbor silted up, so that by late antiquity and the Byzantine period the chief town on the peninsula was

Kallipolis (modern Gelibolu).

“Chigi Vase”

The “Chigi vase” is a Protocorinthian *olpe*, ca. 640 (Villa Giulia Museum, no. 22679) and although not the earliest representation of a phalanx is the clearest and most detailed. It shows two phalanxes, each with two ranks of soldiers facing each other, apparently at close quarters, and therefore seen as proof that the hoplite phalanx existed by that date. However, the spears in the arming scene at the left of the main scene have throwing-loops and it has been argued that the men in the “phalanx” are equipped with a pair of throwing spears and therefore not hoplites. It is not until later in the seventh century that single (thrusting) spears become iconographically more common than paired (throwing) spears. The two sides can also be interpreted as distant from each other, and depicted face to face on the vase because of the artistic convention of avoiding an unsightly gap in the middle of the scene. Similarly, the second rank in each phalanx is almost certainly meant to be seen as some way behind the first, as they are running to catch up and still have their spears at rest.

The "Chigi Vase," mid-seventh-century Protocorinthian *olpe*. Located in the National Etruscan Museum, Villa Giulia, Rome, Italy. (DEA/G. Nimatallah/De Agostini/Getty Images)

Chios, Chians

Chios was a large, 825 square kilometer (320 square mile) island in the eastern Aegean, only 8 kilometers (5 miles) offshore from the Çoşme region of Turkey. This closeness ensured that in antiquity Chios had close ties with Anatolia. The main city of the island, the urban center of the *polis* Chios, lay midway along the eastern coast of the island. Greeks believed that it had been founded by Ionian Greeks around 1,000. Chios also controlled several

surrounding islands and held a small *peraia* (mainland territory) opposite Lesbos, called Atarneus.

As well as the primary settlement and its hinterland, the rest of the island was extensively populated, particularly in the south. Chios was wealthy, with strong maritime trade and an agricultural economy notable for the mastic tree. It had a rich literary history, as the home of the poet Ion, the historian Theopompus, and was allegedly the birthplace of Homer.

With its favorable location, Chios became an early naval power and member of the Ionian League. Chios was a close ally of Miletus, cooperating against Samos, Erythrae, and Lydia. Through a combination of strength, isolation, and a policy of pragmatic capitulation, Chios remained relatively unaffected by the foreign occupations that dominated early Ionian history. This lasted until the early fifth century when Chios joined the Ionian Revolt against Persia, contributing 100 ships and 4,000 marines to the fleet at the battle of Lade. The Chians distinguished themselves, fighting to the end. The survivors abandoned their ships, fleeing on foot past Ephesus where, mistaken for nocturnal raiders, they were slaughtered. Chios was promptly captured by Histiaeus of Miletus, and by the Persians the following year. Herodotus claims that the Persians scoured the island by linking arms to make a chain from coast-to-coast; whether or not we believe the story, it implies that Chios was thoroughly subjugated.

Chios joined the Delian League after the battle of Mycale (479), retaining its navy and independence, and making contributions not of money, but ships. Chios supported Athens in the Second Peloponnesian War, including during the Sicilian Expedition, and was regarded as a prominent ally. Chios became suspect however, and in about 425 had its walls demolished by Athens. Openly revolting in 412, Chios allied with Sparta and prompted revolts throughout Ionia. Chios suffered several defeats, endured a siege, and had its countryside ravaged for the first time since the Persian Wars; yet the revolt was seriously detrimental to Athens, indicating Chios' strength at this time. Chians fought on the Spartan side at the decisive battle of Aegospotami in 405.

Chios remained allied with Sparta until 394 when it ejected its garrison and subsequently fought successively under the Athenian generals Conon and Thrasybulus. Ten years later, the Chians entered into a "perpetual alliance" with Athens that lasted until 357, when they revolted yet again. In the Hellenistic Period, Chios came under Persian and then Macedonian

control; by 191, it was allied with Rome, Pergamum, and Rhodes. A century later, in 86, Mithridates exiled the entire population as punishment for their friendliness toward Rome.

Chremonidean War (267/6–263/2)

The Chremonidean War was a last-ditch effort to secure Greek political freedom (*eleutheria*), unifying Sparta and Athens at the head of a coalition of other Greek cities against the imperial ambitions of the Macedonian Antigonos II Gonatas. It was named after the Athenian statesman and general, Chremonides, who secured the Athenian assembly’s support for an alliance with Areus, king of Sparta. Overall, little is known about the course and causes of the Chremonidean War, although its importance as the final attempt by Greece to assert its independence from foreign control was noted at the time.

The dates of the war are not clear, although Chremonides’ surviving decree was passed during the archonship of Peithidemus (267/6) and the war seems to have lasted three years, or possibly a little longer. Joining the

alliance were Sparta's usual Peloponnesian allies as well as forces from Crete. The decree hints at certain injustices, unkept promises and broken treaties by an unnamed antagonist. It seems as though Antigonos was to blame; after the death of Pyrrhus he had set about reasserting Macedonian dominance in the political and military landscape of Greece. His efforts within the Peloponnese were especially affronting to the Spartans, with Areus attempting to establish himself as a preeminent Hellenistic monarch. At the same time, the Macedonians had fortified the Piraeus and extended their reach throughout Euboea and Boeotia, galling to the Athenians.

Tacitly supported by Ptolemy II Philadelphus (and possibly also by Alexander II of Epirus, who had invaded Macedon at around this time), the grand alliance was nonetheless stifled from the outset of hostilities. Antigonos and the Macedonians had fortified strategic sites and ports throughout Greece, including places in Euboea, as well as the Piraeus and the Acrocorinth (see illustration in Corinth, Corinthians entry). Areus was never able to unite with the allies outside the Peloponnesus and was killed outside Corinth. Ptolemy's assistance was late and muted, and he may have lost effective control over the Aegean after the naval battle of Cos. Meanwhile Alexander's invasion amounted to little more than a distraction.

Despite Areus' death, Sparta continued to resist the Macedonians throughout much of the third century. But Athens surrendered in 263/2 and was forced to accept armed Macedonian garrisons throughout Attica and within Athens itself, with Chremonides himself fleeing to the court of Ptolemy. Athenian leaders and generals who remained in the city were executed, and defeat in this war effectively ended Athens' prominence amongst the Greek cities.

Chremonides (Active 270–240)

Chremonides was an Athenian statesman and later a general and admiral for Ptolemy II Philadelphus. He was renowned for sparking the eponymous Chremonidean War, by supporting the passage of an alliance in 267/6 between Athens and her allies, including Areus, king of Sparta, and the Macedonians under Antigonus II Gonatas. The war ended in Athenian surrender in 263/2, with Chremonides fleeing to the court of Ptolemy II, where he was an admiral of the Ptolemaic fleet. He was defeated in 253 by Agathostratus of Rhodes, but continued to hold this post during the 240s.

Cimon (ca. 510–449)

Cimon, son of Miltiades and Hegesipyle (a Thracian princess) was a prominent conservative Athenian political and military leader in the post-Persian War period, instrumental in establishing the Delian League. Known for his Spartan demeanor, a reputed lack of intelligence, and a hard-drinking youth, his career was nevertheless long and largely successful. Although he suffered political eclipse and exile toward the end of his career, he died on campaign and after a major victory over the Persians.

After the Persian Wars, Cimon played a major role in extending Athenian power and influence in the Aegean. From 479/8 he was frequently elected *strategos* (a mark of both military competence and political power) and from 476 to 473 was continuously engaged in operations against the Persians (and pirates). Around 467/6, his destruction of Persian Aegean-based naval power in the stunning victory at the Eurymedon gave Athens

naval supremacy in the region for over 50 years. He followed this up by ending the Persian presence in the Chersonese and (465–463) besieged the rebellious city of Thasos, forcing it back into the Delian League.

However, these major military successes required long periods away from Athens, during which Ephialtes, supported by a young Pericles, moved against him. A focus of attack was Cimon's "yokefellow policy," which envisaged Sparta, the dominant land power, and Athens, the dominant sea power jointly defending Greece. Over the years this policy, and Cimon himself, became outdated in an increasingly powerful and democratic Athens. The first move, though, was not against Cimon, but the Areopagus—seen by its opponents as exercising a conservative and repressive influence. During the 460s, Ephialtes launched a series of attacks on the integrity of individual members of the Areopagus. However, Cimon's military successes and use of his personal wealth to provide largesse to his fellow citizens maintained his popularity and when he was tried on his return from Thasos he was acquitted.

In 462, he successfully argued for Athenian help for Sparta to suppress a Helot uprising after a devastating earthquake. Cimon led a force of around 4,000 hoplites to help take the rebel stronghold on Mount Ithôme. However, the absence of so many of the hoplite class, his main supporters, allowed Ephialtes and Pericles to transfer most of the powers of the Areopagus to the courts and the *Boule* (Council of 500). Cimon's political fate was sealed when the Spartans, disturbed by the democratic views of the Athenians, sent them away from the siege early, alienating many of those who would normally have supported Cimon. On his return, he failed to get the recent reforms reversed and in 461 was exiled following an ostracism.

In 457, he was denied permission to fight with his fellow citizens at Tanagra but was recalled from exile early a few years later to negotiate the Five Years' Peace with Sparta. In 450/49, he commanded a 200-strong fleet against the Persians on Cyprus, winning a major victory, but shortly afterward died while besieging Citium.

Civilian Populations in War

In Euripides' play, *Trojan Women*, produced a few months after the Athenian destruction of Melos in 416, the god Poseidon comments that retribution will come to the man who sacks cities, sanctuaries, and the tombs of the dead (95–97, QQ 43). The play is set in the mythical past, immediately after the sack of Troy, and deals sympathetically with the plight of the Trojan widows who are about to be taken off to Greece as slaves. Many have taken this play to be critical of the Athenian treatment of the Melian population, whose adult males were executed and women and children enslaved. Yet the Greeks had no formal strictures about the treatment of civilians: insofar as there were limits on war, they mainly had to do with assaults on sanctuaries and, by extension, the gods. Civilians were a fair target.

Indeed, in the Archaic and Classical Periods, when most cities depended on citizen soldiers, the distinction between soldier and civilian was blurred. An invading army might with impunity kill farmers out in their fields or, as the Thebans had intended to do at Plataea in 431, capture those outside the city and use them as hostages. When Herodotus describes the Persians raping and killing anybody they could catch on their march through Phocis in 480, we are meant to understand this as a sign of Persian barbarity. And yet Greeks regularly did these things to each other too. When cities were sacked, rape and pillage were the norm; the conquerors had an absolute right to do as they would with prisoners. As Aristotle put it, “those vanquished in war are held to belong to the victor” (*Politics* 1255a).

Enslavement of individual civilians or of whole populations was common. This meant that all people in Greece had to live with the prospect that, if things went badly enough wrong, their lives might be utterly wrecked. Thucydides comments, when the Athenians invaded Chios after it

revolted in 412, on the highly unusual fact that its land had not been ravaged by an enemy since the Persian War, nearly 70 years before. Very few places went so long without enemies in their territory. When free families were enslaved, slave traders would have felt no compunction to keep them together: husbands and wives, children and parents would have been separated, most often permanently.

The fates that could await the inhabitants of defeated cities are well illustrated by those of three small towns in the Chalcidice, which became caught up in the struggle between the Athenians and the enterprising Spartan, Brasidas, in 424–422. Brasidas captured Torone in winter 424/3, while Scione and Mende revolted from Athens and went over to Brasidas in 423. Their revolt probably occurred after a one-year truce, committing the two sides not to extend their possessions, was agreed by Athens and Sparta but before the news of it had reached the Chalcidice. The Athenians were particularly angry with the two cities that had revolted after the truce was agreed. They besieged both, and when the gates of Mende were opened due to internal dissension in the town (a common story), the Athenians sacked it “as if it had been taken by storm”—the generals had difficulty in restraining the soldiers from massacring the population. Scione suffered a worse fate. The Peace of Nicias in 421 gave the Athenians *carte blanche* to deal with it as they wanted. Shortly afterward they succeeded in capturing the town and, in accordance with a decree moved by the now dead Cleon, they enslaved the women and children and executed the adult males—the same punishment inflicted on Melos in 416. (The term for this was *andrapodismos*, though that could also refer to the enslavement of the whole population.) Torone, which had been captured by rather than gone over to Brasidas, was treated slightly more leniently, but even here there were enormous human tragedies. Cleon captured the city in 422 and enslaved the women and children; but instead of massacring the men he sent them to Athens as prisoners. After the Peace of Nicias, they were freed through a prisoner-exchange with Olynthus, and presumably returned home. But tracking down their wives and children, who could have been sold anywhere in the Aegean, must have been next to impossible: families were permanently split apart.

Sieges were immensely trying experiences for those trapped in the city being besieged. In the Classical Period, the standard tactics to take cities were to either starve them out or to find some group inside the walls willing

to turn traitor. Starvation could be exactly that: when the Athenians besieged Sestos in 479/8, the inhabitants were reduced to boiling the leather straps from their beds and eating them. When Athens was besieged by Lysander in 405, the citizens had the additional fear that once the city fell their enemies would take the opportunity to treat the Athenians as they had treated towns like Melos and Scione. But in addition to the psychological blows of turning from being members of a state that had arrogantly disposed its power across the whole Greek world to a likelihood of future enslavement and execution, they were also starving. By the end of the siege, according to Xenophon, many were dying of starvation every day.

War, especially prolonged wars, brought other risks too. One was disease, particularly during sieges. The most famous example of this is the plague at Athens in 430–429, during the Second Peloponnesian War. First appearing in the Piraeus (Thucydides 2.48, suggests it originated in Ethiopia and spread via Egypt), it rapidly spread to the city and caused considerable casualties because of the crowded conditions caused by the war. Thucydides notes a breakdown in morality and order because of the plague—a precursor to what he sees as a general decline in behavior and social order under the prolonged stress of the war. He famously saw this general decline as occurring first in Corcyra, but then becoming widespread (Document 9).

Agricultural ravaging was an endemic part of Greek warfare: invaders would burn or slash crops, cut vines, attempt to saw limbs off olive trees, and loot anything they could that inhabitants had left behind, including the timber off houses. The degree of economic loss has proved impossible to quantify, and even in qualitative terms is much disputed. But what is certain is the heartache, anger, and frustration that hardworking farmers must have felt coming back to their vandalized farms, quite apart from their anxiety over possible future hunger. When Archidamus first invaded Attica in 431, at the start of the Second Peloponnesian War, he deliberately targeted the deme of Acharnae, because he knew that it had a large and stubborn population, and it was visible from Athens: the Acharnian farmers would be able to see the smoke rising from their farms and, he hoped, would force their fellow Athenians out to fight. Agricultural ravaging was used because it was an exceptionally good technique for inflicting suffering, both material and psychological.

Even if the enemy was not actually damaging their land, farmers must have found sieges very frustrating. They were forced to crowd into fortified

areas or depart to mountains or islands. The mixed cropping nature of Greek farming meant that there was agricultural work to be done at almost all times of the year. In larger cities, these periods of refuge meant also the loss of normal social bonds. Dicaeopolis, the hero of Aristophanes' *Acharnians*, laments the commercial ways of the city that contrast with the reciprocity and barter he is used to in his deme. The *Acharnians* also suggests the depths of poverty that repeated ravaging could inflict on a less wealthy state than Athens, with a Megarian who is desperate enough to sell his young daughters for sex in return for small amounts of food and salt.

Even an army that was passing through without specific hostile intent was a danger. Greek armies depended on foraging for or buying their food on campaign and could easily demand enough food from a small town to seriously deplete the town's reserves for the months ahead. As an alternative to simply having food reserves stolen or requisitioned, townspeople might often agree to set up a market for the visitors, so that they would at least be paid for what they gave up.

Another area that is impossible to quantify is the degree to which families suffered from the loss of labor when soldiers went off to war. In early times, campaigns were generally short and may have avoided the peak periods on the farm such as harvest. The soldiers were farmers too, in a hurry to be back to work their own farms. Later, long overseas campaigns will have taken men away from their families for months or years at a time. The problem is that we do not know enough about the rural economy to estimate how big a problem this was. Other family members, including women, will no doubt have had to contribute more labor, but the main variable we lack is how many slaves a typical farmer had. A hoplite might well take a slave to war with him as an attendant, but perhaps only if he had other slaves left to do most of the work on the farm. How well poorer farmers coped, we cannot know.

A law-court speech by Lysias gives us a rare glimpse of the social dislocations caused by war. An Athenian hoplite, Diodotus, was killed fighting with Thrasyllus at Ephesus in 409. He had left his brother, Diogeiton, as guardian of his children and wife (who happened also to be Diogeiton's daughter), and of his property, in case anything happened to him. Very often such arrangements must have worked satisfactorily, but in this case Diogeiton squandered the money, gave the wife away with a dowry less than Diodotus had left for her, and left her children with no

inheritance. The case ended up in court. A generation-long war like the Second Peloponnesian War must have generated hundreds, if not thousands of similar cases of social and economic dislocation.

On the other side, war provided opportunities. The family of Lysias, the speech-writer for the case against Diogeiton, had grown wealthy as owners of a large workshop making shields: no doubt they did quite well out of the war. For a large class of poorer men, the prospects of rowing in the fleet offered appealingly steady income through the summer months, while also allowing them to be full participants in the grand myth of the Athenian Empire. The fleet was not entirely crewed by Athenian citizens or residents. Many islanders will also have seen rowing in the fleet as useful income, as well as a way to earn back some of the tribute their states paid to Athens. Or a man could send his slave to row, as a source of income for himself, and perhaps even row alongside him.

Similar considerations apply to mercenary soldiers, who became more and more common in the fourth century and afterward. Poorer areas, such as Arcadia, were especially famous as sources of mercenaries, for whom the prospects of regular pay, adventure, and possible enrichment if they sacked a town may have seemed a reasonable alternative to a hardy life on the Arcadian plateau.

In Athens, as a radical democracy, we can clearly see how the greater part of the population felt about war. Expeditions had to be approved by the assembly, in which every citizen could vote so long as they turned up. The size of Attica will have skewed the assembly toward those who lived close to Athens and the Piraeus. That will have included a lot of landless sailors, while farmers from the more distant parts of Attica may have felt attending the assembly was too troublesome, and would take them away from their deme and farm. This may be part of the reason for the oligarchic movements of the later fifth century, as (admittedly snobbish) members of the upper classes, including Thucydides and Aristophanes but also including the oligarchic leaders of 411 and 404, considered the assembly to be overly bellicose, bringing disasters, such as the Sicilian expedition, upon the city. The flipside is that to many in the assembly, the risks of war seemed worth taking given the potential economic benefits, and the enhanced prestige of the city in which they too were shareholders. What their wives thought, we cannot know (though Aristophanes' *Lysistrata* might suggest that they did not always agree with their husbands' priorities).

Clearchus (ca. 450–401)

Clearchus, son of Ramphias, was a Spartan officer most famous as a commander of the Ten Thousand in Cyrus the Younger’s attempt on the Persian throne. He first appears in charge of Chalcedon and Byzantium in 409 during the Second Peloponnesian War (431–404). A harsh disciplinarian, his unequal allocation of food rations in Byzantium led to its defection to Athens (408). He was exiled from Sparta in 403 when he disobeyed orders to return home. Clearchus played a major role in recruiting the Ten Thousand for service under Cyrus the Younger against his brother, Artaxerxes II. After Cyrus was killed at Cunaxa, Tissaphernes treacherously seized Clearchus at a meeting and executed him. Xenophon, who served with him, portrays Clearchus as a highly professional officer, prone to outbursts of rage. This combined with his harsh discipline made him respected but unloved by his men—and, it has been suggested, possibly a PTSD sufferer.

Cleisthenes (ca. 570–after ca. 506)

Cleisthenes was an Athenian statesman and reformer. Son of Megacles and Agariste, daughter of Cleisthenes of Sicyon, Cleisthenes was a prominent member of the aristocratic Alcmaeonid family and took a full part in the aristocratic faction fighting at the end of the sixth century.

Archon in 525/4, after some 20 years in exile, Cleisthenes was again exiled (ca. 514) but, it was claimed, bribed the Delphic Oracle to pressure the Spartans to depose the tyrant Hippias. Although this succeeded (511/10) and the Alcmaeonidae returned to Athens, Cleisthenes’ rival Isagoras gathered enough aristocratic support to be elected archon for 508/7. Outmaneuvered, Cleisthenes turned to the people, gaining enough popular support to pass major reforms and then eject Cleomenes I of Sparta when he returned to support Isagoras.

Cleisthenes is widely regarded as creating the Athenian democracy by building on Solon’s earlier reforms. He created the *Boule* (Council of 500), replaced the 4 tribes with 10 new ones, and created a highly artificial internal tribal structure of *trittyes* (thirds), with each *trittys* comprising a varying number of demes. Deme membership became the basis of citizenship. There was probably a military element to his reforms—the *trittyes* seem to have been arranged to assist mobilization of the tribal military contingents along major routes and the creation of 10 elected generals (*strategoi*) may also (but not certainly) have been part of them.

However, the main purpose seems to have been to break up aristocratic power blocs, while perhaps preserving his own. If Cleisthenes did try to preserve his own family influence, though, it was with limited success—he disappeared from history shortly after his reforms, and his family did not unduly dominate Athenian politics in the early fifth century.

Although in many respects a typical Athenian aristocratic leader of the time, Cleisthenes' appeal to the people is unusual—aristocrats were generally a little wary of this as it could weaken the whole class. His reforms helped further loosen aristocratic control and did establish a true democratic system.

Cleisthenes of Sicyon (Ruled ca. 600–560)

Cleisthenes (not to be confused with his grandson of the same name, the famous Athenian statesman) was tyrant of Sicyon from ca. 600 to 560, coming to power in a dynastic struggle within the non-Dorian Orthagorid dynasty. Cleisthenes was seen in antiquity as a mild, fairly constitutional, tyrant responsible for Sicyon's considerable sixth century power, prosperity, and prestige. Although details are sketchy, Cleisthenes' reign involved a war (of unknown outcome) with Argos and, according to much later sources, successful support for Delphi in the First Sacred War. Internally, it seems to have been characterized by racial tension.

Cleisthenes' hatred of Argos supposedly led him to ban public poetry

recitals, because Homer honored the Argives, and to his setting up Melanippus as a rival to the traditionally honored Argive hero Adrastus. His internal reforms allegedly included renaming the four tribes at Sicyon: his own, non-Dorian tribe as Archelaioi (Rulers) and the Dorian tribes as Hyatae (Swine-men), Choireatae (Pig-men), and Oneatae (Ass-men). If true (and more recent scholarship argues otherwise), this reflects tension between the original non-Dorian locals and later Dorian conquerors—similar to that perhaps contributing to unrest prior to the Cypselid tyranny in Corinth. Cleisthenes’ reign is an example of the “good tyrant” of Greek political writing and the use of religion and ethnicity in political propaganda and action.

Cleitarchus (Fourth Century)

A historian of Alexander the Great, who wrote (probably in Alexandria) one of the earliest accounts of his campaigns in the late fourth century. His history, while not a first-hand account, was probably based on first-hand information and likely written during the reign of Ptolemy I Soter. His writing has not survived, but was widely read and greatly influenced the “Vulgate” tradition of Alexander historians, notably Diodorus and Curtius Rufus. Despite the fragmentary and shadowy nature of his work, Cleitarchus was nonetheless important to the ancient historians of Alexander, especially during the late Roman Republic and early Empire.

Cleitus (the Admiral) (d. 318)

Cleitus, nicknamed “the White” was a Macedonian noble, a land commander in Alexander the Great’s Indian campaign, and an admiral in the wars of his Successors (*diadochoi*). As admiral, under Antipater in the Lamian War, Cleitus defeated the Athenian fleet in a series of battles. In 318, commanding Polyperchon’s fleet against Cassander, he won a major naval victory in the Propontis but lost his entire fleet the next morning to a dawn attack on his camp by Antigonus I Monophthalmus. Cleitus got away but was captured by Lysimachus’ men in Thrace and executed.

Cleitus the Black (d. 328)

A prominent Macedonian and the commander of Alexander the Great’s Royal Squadron. Cleitus’ family had a long established connection with the royal family, as he had served under Philip II, and was the brother of Lanice, who had been Alexander’s nursemaid.

During his career, Cleitus distinguished himself by saving Alexander’s

life during the battle at the Granicus (334). Later he went on to share command of the Companions with Hephaestion, and so occupied a prominent position in the army. Cleitus appears to have felt the same anger and frustration of the more traditional Macedonian members of the army, who disapproved of Alexander's flatterers and his changing political policies. This was to be his downfall; when Cleitus drunkenly spoke some ill-chosen words to this effect at a party, Alexander ran him through with a spear.

Cleombrotus I (Reigned 380–371)

Cleombrotus I, from the Agiad royal house at Sparta, succeeded his brother Agesipolis as king in 380. His military career before 371 was inauspicious. He arrived too late to relieve the Spartan garrison besieged on the Cadmea in Thebes after the uprising of 379/8. In 376, when Agesilaus was ill, he commanded an invasion of Boeotia, but failed to secure the route across Mount Cithaeron, as Agesilaus had done in the previous two years.

In the summer of 371, Cleombrotus commanded an army in Phocis and was ordered to attack Thebes, which had refused to accept the Common Peace treaty agreed to in Sparta by every other *polis*. He enterprisingly brought his army into Boeotia by an unexpected route across the mountains to Thisbe in southern Boeotia. He had thus turned the Theban defensive position at Chaeronea. He advanced to Leuctra, some 11 miles (18 kilometers) southwest of Thebes, where he was met by the Thebans. Cleombrotus drew up his phalanx in a conventional manner and did nothing to counter the Theban superiority in cavalry or the tactical innovations to be expected from the Theban generals. He was killed in what was a catastrophic defeat for Sparta. He fell in the thick of the fighting, in keeping with the traditional Spartan code of honor.

Cleomenes I (Reigned ca. 520–ca. 490)

Cleomenes I, from the Agiad royal house, was king of Sparta ca. 520–490. Herodotus (ca. 485–425) records a number of colorful stories of his activities. Plainly he was a striking individual who left behind vivid memories. Cleomenes was the son of his father's second (bigamous) marriage. His accession to the throne drove his half-brother Dorieus into adventures abroad.

In foreign policy, Cleomenes is first heard of commanding an army in Boeotia in 519, when he urged Plataea to turn to Athens for an alliance. His motive was allegedly to stir up hostility between Athens and Boeotia (Herodotus 6.108; Thucydides 3.68). He led the force that expelled the Peisistratidae, from Athens in 511/10, and another force that tried to expel the democratic reformer Cleisthenes and his supporters in 508/7. On this occasion, he was blockaded on the Acropolis by an Athenian uprising and forced to withdraw. A year or more later, when Sparta sent an allied army to restore the oligarch Isagoras in Athens, Cleomenes was frustrated by opposition from his fellow-king Demaratus and from the Corinthians, which caused the expedition to lapse.

Demaratus frustrated Cleomenes again by refusing to cooperate when he tried to intimidate Aegina into reversing its formal submission to Persia. In retaliation, Cleomenes conspired with Leotychidas, a relative of Demaratus hostile to him, to have his fellow-king deposed on the ground that he was of illegitimate birth. He allegedly resorted to bribing the Pythian priestess at Delphi to get the necessary oracle. Leotychidas combined with Cleomenes to force Aegina to hand over hostages.

Cleomenes' actions here have been regarded as showing he had a long-sighted policy of building up Greek resistance to Persia but the case is not clear.

Cleomenes led an invasion of Argos that resulted in a great victory at the battle of Sepeia (ca. 494). He did not take the city of Argos and on returning to Sparta was put on trial on the charge of having been bribed not to take Argos. He offered the defense that his burning of a sacred grove called Argos, where Argives had taken refuge after the battle, fulfilled an oracle about taking Argos. He was acquitted but soon afterward his bribery of the Pythian Priestess became known. He fled to Arcadia and organized a conspiracy of Arcadians to establish some kind of personal supremacy for himself. In alarm, the Spartans recalled him but he died soon afterward in bizarre circumstances: confined in stocks because of assaults on people, he ended his life, so the story goes, by self-mutilation. This story is consistent with the belief that Cleomenes had always been mentally ill (Herodotus 6.75), but its truth, like much about else about Cleomenes' personality, cannot be established on present evidence.

Cleomenes III (Reigned ca. 235–222)

Cleomenes III of the Agiad royal house became king of Sparta ca. 235, succeeding his father Leonidas, who had led the opposition that crushed the radical young king Agis IV (reigned ca. 243–241). During his reign, Cleomenes carried out a social revolution at Sparta and came close to making Sparta militarily dominant in the Peloponnese.

When the Achaean League began a war of aggression against Sparta and its new young king, Cleomenes established himself as an inspiring leader of

Sparta's army. He campaigned in Arcadia, bringing Tegea, Mantinea, and Orchomenus under Spartan control, and launched lightning raids on Achaean territory, skillfully using light-armed troops and mercenaries (229). In 228, he inflicted two defeats on the League in pitched battles, one at Mount Lycaenum in Elis and the other at Megalopolis. Returning home as the man of the hour, he used his loyal troops to carry out a violent coup. The ephorate was abolished and the *gerousia* made into an annually elected body. The other king was a nonentity and Cleomenes ruled Sparta as an autocrat. He abolished debts and carried out a redistribution of the land of Sparta, creating thousands of small individual holdings, of approximately equal size. He recruited 4,000 suitable men from among the *Perioikoi* into the citizen body. He also revived the old Spartan practices, which had largely fallen into disuse, of common meals and rigorous physical and military training. A military innovator, Cleomenes abandoned the traditional hoplite equipment and trained his troops to use the two-handed *sarissa* and the shield supported by a strap round the neck.

Cleomenes had thus created not only a new social order but also a citizen army of a size, fighting spirit and level of training that no other Greek state could match. In 225, he defeated Argos and in the following year put Corinth under siege. The Achaean League seemed on the point of breaking up. To meet this crisis, the Achaean leader Aratus made common cause against Cleomenes with the old enemy of the League, the Macedonian monarchy. A combined offensive by the Achaeans and Antigonos III Doson drove Cleomenes back within his own borders and deprived him of Peloponnesian allies. Undeterred, Cleomenes sold freedom to 6,000 Helots at 500 drachmae a head and used the proceeds to create a strike force of 2,000 men armed with Macedonian equipment. Stiffening his army with this force, he made a feint toward Argos and captured Megalopolis in a surprise attack and pillaged it (223).

He then mustered every available man to face an invasion of Laconia by the combined forces of the Achaean League and Antigonos III Doson of Macedonia. In a great battle fought at Sellasia on the Spartan frontier (222), Cleomenes was defeated with catastrophic losses. He fled to Egypt, which had long subsidized his wars. He committed suicide to escape execution after attempting to stage an uprising against Ptolemy IV Philopator (220/19).

Cleon (d. 422)

Cleon, son of Cleaenetus, was a controversial Athenian politician and general (*strategos*) during the Peloponnesian War of 431–404. His career provides another example of the lack of delineation between political and military life in most ancient Greek societies and the dangers of amateur commanders. The son of a wealthy father whose interests included a tannery, Cleon was a radical democratic politician.

Identifying Cleon's role in Athenian political and military conflict—and assessing his performance in these areas—is difficult because both of the extant contemporary sources are hostile to him. The historian Thucydides and the comic poet Aristophanes portray Cleon as a dishonest and cowardly radical democrat who lacked the competence to lead in war. Whatever the truth of these portraits, their similarities meant Cleon's reputation was fairly poor until more favorably inclined twentieth-century scholars saw him as a true democrat savaged by conservative writers unsympathetic to democracy.

Cleon really came to prominence after Pericles' death (429), apparently pursuing a more land-based strategy in opposition to Pericles' policy of maritime operations and avoiding major land engagements. He was a staunch proponent of the Athenian Empire and the need to keep order, if necessary by harsh measures. In 427 (Mytilene) and again in 423 (Scione), he proposed successful motions in the assembly to execute the males and sell into slavery the women and children of cities that had revolted. Mytilene was ultimately spared but Scione was not.

In 425, Cleon took charge of the operation to secure Pylos and Sphacteria. Although Thucydides and Aristophanes suggest Demosthenes did the real military planning, Cleon's judgment in arguing both for an attack and a suitable force was sound. Thucydides' criticism of Cleon for blocking the Spartan peace proposals that preceded this expedition is based on hindsight and rather unfair—it was a reasonable decision on the facts at the time. Cleon may also have been associated with the Athenian attempt to neutralize Boeotia in the 424 Delium campaign. Although unsuccessful, a victory at Delium would have freed Athens from a land war on two fronts and the Spartans may have been unable to continue the war effort.

In 422, Cleon sailed with a force of 1,200 Athenian hoplites, 300 cavalry, and 30 ships, and an unknown but large number of allies to recover the strategic center of Amphipolis and the other states in the region. Cleon recovered Galepsus and Torone and possibly another half-dozen or so places. However, the evidence for their revolt and recapture is open to debate—and most were pretty insignificant.

Cleon conducted a reconnaissance in force to Amphipolis with his entire army but apparently mishandled the withdrawal, misjudging the time available to wheel his army given its proximity to the city. The enemy commander, Brasidas, launched an attack, taking the Athenians by surprise in mid-maneuver. The part of the army already marching off simply fled and the rest ultimately collapsed under pressure from the enemy cavalry and light troops. Cleon was killed—running away according to Thucydides and fighting bravely according to Diodorus (although his account is a suspiciously stock battle description). Cleon seems to have been an influential politician, with generally very good strategic instincts. However, he seems to have lacked the basic skills to maneuver a hoplite force at the tactical level.

Cleopatra VII (69–30)

Cleopatra VII was the last of the Ptolemies to rule Egypt. The historical Cleopatra is nothing like the Cleopatra of popular culture. She was of Macedonian and Greek descent and was not a black African. She was not strikingly beautiful but fairly good-looking (Plutarch, *Antony* 27). What was remarkable about her was high intelligence, political shrewdness, a forceful personality, and a charismatic ability to work on powerful men. She could be ruthless when necessary, for example, when she had her exiled half-sister Arsinoe killed in 41.

Cleopatra briefly became sole ruler in 51 on the death of her father, Ptolemy XII Auletes. She was soon forced to accept her 10-year old younger half-brother Ptolemy XIII as joint ruler and husband but soon fell out with his guardians and was expelled. It was this Ptolemy who ordered the killing of Pompey the Great when he sought refuge in Egypt (late September, 48). When Julius Caesar arrived a few days later, he did not get the cooperation he expected and so took the side of Cleopatra, then on Egypt's eastern border with an army of her own. Caesar defeated her half-brother and younger sister Arsinoe and installed Cleopatra as coruler, and therefore wife, of another younger brother Ptolemy XIV, then 11 years old.

A marble bust of Cleopatra VII. Cleopatra was the last Ptolemaic ruler of Egypt, and died in 30 when Augustus defeated Cleopatra's lover, Mark Antony, and incorporated Egypt into the Roman empire. The bust is now in the Altes Museum in Berlin, Germany. (Sandro Vannini/Corbis)

Cleopatra realized the plain fact that the Ptolemaic kingdom of Egypt had long depended on the good will of the Roman Republic and that in particular the dynasty was propped up by Roman support ever since Aulus Gabinius had restored her father to power in 55. The power struggles within the Ptolemaic dynastic made it obvious to Cleopatra that she should win and hold the support of the men of power in Rome. Her sexual relationships with Caesar (48–47) and later Marcus Antonius (first 41–40, then 37–30) were as much about politics as passion.

In summer 47, Cleopatra had a son named Ptolemy Caesarion, whose father was, as Cleopatra claimed and the world thought it knew, Julius

Caesar. Cleopatra was in Rome from 46–44. Caesar restored Cyprus (annexed by Rome in 57) to her kingdom. She returned to Egypt in about April 44, when Ptolemy XIV conveniently died. Since rule by a woman on her own was contrary to Ptolemaic convention, Cleopatra made Caesarion her coregulator as Ptolemy XV Caesar.

Later, in all her dealings with Antonius Cleopatra made sure that she received territories in return for the financial and material support she gave his army. She received the region of Chalcis in Syria in 41 and later concessions in Palestine included Jericho, valuable for its highly productive date palms.

By Antonius she had twins Alexander Helios (“The Sun”) and Cleopatra Selene (“The Moon”) born in 40 and a son Ptolemy Philadelphus in 36. In 34, with Antonius at her side she presided over a spectacular ceremony in Alexandria in which she took the title of Queen of Queens and her son Caesarion that of King of Kings.

Following Augustus’ victory over Antonius and Cleopatra at Actium, Cleopatra committed suicide on or about August 10, 30, to avoid being paraded in a Roman triumph (as had happened to her half-sister Arsinoe). Caesarion was quietly killed. Her other children by Antonius were raised by Antonius’ ex-wife Octavia. Selene later married King Juba II of Mauritania. What became of the others is unknown.

In her reign Cleopatra took the traditional Ptolemaic titles Philopator (“Father’s Beloved”) and Thea Neotera (“Younger Goddess”), as well as a new one Philopatris (“Lover of the Land”). The last reflects her active patronage of native Egyptian cults. She was the only Ptolemaic ruler to speak Egyptian and her cult image as Pharaoh, along with Caesarion, may be seen at the Temple of Hathor, Dendera.

Cnidus, Battle of (394)

In early August 394 (the dating comes from a solar eclipse in Xenophon, *Hellenica* 4.3.10), a naval battle was fought off Cnidus in Asia Minor between a fleet under Spartan command and a fleet raised from Phoenicia, Cyprus and other parts of the Persian Empire under the overall command of the satrap Pharnabazus, assisted by the Athenian exile Conon as his operational commander.

By 396, the fourth year of Sparta's war against Persia in Asia Minor, reports had reached Greece of a massive build-up of Persian naval power for an offensive against Greece. These reports had their basis in Pharnabazus' activity, making use of the services of Conon, in building up naval power to counter the superiority of Sparta's forces in the war on land. Persian preparations were never quick and it was only late in the summer of 395 that Sparta saw the need to assign the naval command to King Agesilaus II, then leading the land forces in Asia Minor. Sparta had maintained only minimal naval forces in the Aegean since the end of the Peloponnesian War (404), so Agesilaus ordered the construction of new triremes, a hundred and twenty of which were built.

Agesilaus appointed as navarch his brother-in-law Peisander, an ambitious man but with no experience of naval warfare. Peisander led his fleet of 85 ships eastward from Cnidus toward Physcus (modern Marmaris). In that vicinity he encountered the fleet under Pharnabazus and Conon of over 90 ships. These numbers are given by Diodorus, while Xenophon states (*Hellenica* 4.3.11) that Peisander was outnumbered by Conon's Greek squadron alone. Peisander's left wing, which was presumably on the seaward side, fled as soon as the fleets engaged and the rest of the Spartan fleet was driven ashore. Peisander himself died fighting on his ship. Fifty of his ships were captured and most of his crews fled by land to near-by Cnidus.

The battle of Cnidus broke Spartan naval control of the Aegean. Immediately after the battle Conon cruised through the islands of the Aegean to the Hellespont, expelling Spartan harmosts (governors). In the following year (393), Pharnabazus accompanied Conon on the fleet. They raided the island of Cythera to the south of Sparta, establishing a garrison there, and made a triumphal visit to a meeting of the anti-Spartan allies at Corinth.

Coenus (d. 326)

Coenus, son of Polemocrates, was a Macedonian general prominent in Alexander the Great's Asian campaigns. Like many of Alexander's commanders, Coenus started in infantry command but ended as a cavalry commander. This was a promotion, but may also have been influenced by the more mobile, cavalry-heavy style of warfare adopted in the Bactrian and Indian campaigns. Coenus first appears with Alexander in Thrace in 335 and in Asia commanded infantry contingents at the Granicus, Issus, and Gaugamela (where he was wounded). At Tyre his battalion was chosen as part of the final assault. In 328, he commanded one-third of the army in Sogdiana and played a pivotal role at the Hydaspes (326).

Coenus married Parmenion's daughter ca. 335, but in 330 was very vocal in his condemnation of Philotas, his brother-in-law, who was accused of treason. This may have been to distance himself from punishment, which in such cases often extended to relatives and associates. When Alexander's troops refused to cross the Hyphasis River and continue east, Coenus, acting

as their spokesman, successfully urged Alexander to turn back. Shortly afterward, Coenus died of illness and Alexander gave him an elaborate funeral.

Coinage

Recent research on Greek coinage has confirmed its rapid spread in the Greek world from its beginnings ca. 550 to ca. 480, when there were already at least a hundred Greek cities issuing coins. It has also become clear that, from the earliest phases of coinage, Greek states issued significant amounts of small-denomination coins. This fact indicates that monetization, that is the extent to which Greeks used coinage in everyday exchanges as well as in major transactions, was more widespread and more significant than previously thought.

From the late sixth century onward, the leading Greek states had accumulated sufficient resources to carry on extended campaigns outside their own territories. Thucydides (1.1–23) drew attention to this development in his argument that the Second Peloponnesian War (431–404) was the greatest that had occurred in Greek history. Thucydides apparently had in mind material resources of all kinds, but coinage was a particularly important part of this development. Because it was easy to use and convenient to store, as well as multiplying the range of transactions possible, coinage made possible a more highly developed and sophisticated

economy.

Greek states did not have an organized system of commissariat to keep forces supplied when on extended campaign. It was semiproverbial in Athens to refer to hoplite military service as “three days’ rations” or “salt and onions,” referring to the limited amount of basic foodstuffs that troops carried on a campaign outside their borders. Troops serving for longer than this had to live off the country or to buy food and other necessities either from markets provided by friendly states or from the crowd of merchants and dealers who accompanied every army on the move. Troops, especially the crews of warships, needed to be paid wages in cash so they could support themselves. Thucydides saw that states needed large sums of money in reserve and from revenues to send out expeditions by sea on a scale to create an empire.

The increasing use of mercenaries intensified the need to have enough money to fight a war. Citizen troops could be induced, up to a point, to look after themselves for limited periods; mercenaries expected to be paid. The growing monetization of the Greek world thus made it possible for powerful Greek states to fight wars outside their territories for long periods of time. This pattern of warfare was intensified in the Hellenistic Period, when standing armies of mercenaries became common. Every Greek power fighting an extended war needed a supply of precious-metal coinage. Finding these funds was as much a part of the art of generalship as strategy or tactics.

Colonies, Colonization

Although there is evidence for Greek colonies (or at least trading settlements) in the Mycenaean and Minoan Periods, the great waves of colonization occurred from the eighth to the sixth centuries, especially between ca. 750–550. During this period, colonies were settled in Asia Minor, the Black Sea, the Adriatic, Italy and Sicily, Sardinia and Corsica, and even France and Spain. Founding a colony had the capacity to decrease conflict in the mother city. However, it often involved conflict with the local population at the new site, or even conflict between states over suitable sites or control of a region, and later on, between different colonies or colony and mother city. Colonization was also a major contributor to the spread of Greek culture and influence around the ancient Mediterranean and Asia Minor—as well as a conduit for the influence of other peoples and cultures on mainland Greece.

Colonization was essentially enabled by sea travel. Colonies were generally founded on the coast, rather than inland (an exception was the Athenian attempt to establish a colony north of Amphipolis in Thrace that ended in disaster at Drabescus) and contact with the mother city was by sea. The existence of strong naval powers such as the Phoenicians and Etruscans could cause problems for Greek expansion. The mixed success of Greek colonies in France and Spain, predominantly founded by Phocaea and Cnidus, demonstrate this. The Phocaean colony of Massilia (Marseilles) became strong and wealthy enough to found its own colonies, including Antipolis in France and Emporium in Spain. However, conflict with the Etruscans and the Phoenicians caused several colonies to fail, including Alalia on Corsica and the westernmost, Tartessus, in Spain. However, a strong land power, or strong local resistance could also limit the spread. Egypt is a good example of this. It was too powerful to be penetrated by force—the Greeks had to be content with a strictly regulated trade settlement at Naucratis.

There were many specific reasons for founding a colony, but several broad categories can be identified. One was the need for new agricultural land, either because of overpopulation or poor conditions—Thera founded Cyrene after a drought and Chalcis founded Rhegium after a famine. As populations expanded, if the inheritance system was based on primogeniture (where the eldest son inherited), younger sons without land were prime recruits for colonists. Conversely, where all sons received an equal share of their father's estate, it was possible for the plots to reduce in

size over the generations until they could not support a family. Commerce, either with the local inhabitants or based on securing local resources for trade back to Greece, was also a motive. Naucratis, Cumae, Naxos, and Syracuse are examples where trade was either dominant or an important motive. The Euboeans seem to have founded Pithecusae (Ischia) in Italy and the Milesians Sinope and Trapezus in the Black Sea because of the mineral resources there. Amphipolis was probably founded for trade inland as well as to exploit the region's natural resources.

Piracy or control of a strategic region, for example, straits (which could allow the levying of tolls) are also possible motives at the Lipari islands and the first occupation of Zancle. *Poleis* could also establish colonies to extend their interests and influence, although there is often overlap between this motive and commerce or piracy/control of a region. Corinth is a good example of a city founding colonies in strategic locations to control routes and regions, especially on the route to Italy and Sicily. Internal political or civil conflict could also result in a group deciding (or being forced) to establish a colony. Examples include Rhegium and the Spartan colony of Taras, both in Italy. Many colonizing expeditions seem to have been led by disaffected aristocrats. External threat could also motivate colonization—Phocaea is the prime example of this. In addition, a colony could of course be founded for a combination of the reasons discussed above.

The process for founding a colony was fairly standardized, although often varied according to circumstance—especially when it resulted from the flight or expulsion of a whole population from a region because of war. A leader (the *oikistes*) was chosen, or self-appointed, colonists selected (sometimes by lot, sometimes by payment, sometimes simply by volunteering), sometimes an oracle such as that at Delphi might be consulted, and the expedition departed, carrying sacred fire and earth from the mother city. Colonists could be drawn from more than one mother city. Where the inhabitants at the destination were known to be, or considered, a threat it is likely that the first contingent comprised only men of fighting age, with the women and children to follow after. On arrival, and having secured the site (the ideal was a defensible headland or island, with suitable agricultural land and the ability to trade with the locals) the colonists would distribute the land and establish their city. Its customs and institutions generally replicated those of the mother city.

However, once established, the colony became independent of the

mother city. There were some exceptions to this in Sicily (Zancle and its colony Mylae) and the Black Sea (Sinope and its colonies Cotyora, Cerasus, and Trapezus), involving colonies and the colonies they had founded, but the main example is Corinth. It retained (or attempted to retain) more control over its colonies, for example, sending out magistrates to Potidaea and taking precedence in religious ceremonies. One of the causes of the Second Peloponnesian War (431–404) was Corinth's attempt to exert influence over its colony Corcyra by interfering between Corcyra and one of Corcyra's colonies, Epidamnus.

It was not uncommon for well-established (or precarious) colonies to found colonies of their own, in which case it was traditional for the *oikistes* to come not from the founding city but from its original mother city. The link between the second generation and original mother city was even more symbolic than for a first generation colony and its mother city, but again, the relationship between Corinth, Corcyra, and Epidamnus was an exception to this.

Colonies, Military

The Greeks sent out colonies (*apoikia*) across the Mediterranean in the Archaic Period (ca. 700–480). Many of these colonies might be deemed military in nature as they consisted of men of fighting age who secured the territory for new settlement and often married the local women they found at the site, having killed the local men. Colonies drew fighting men to them in search of gain. Archilochus (F102) sings that the scum of Greece came to Thasos to fight for its gold mines. However, the deliberate establishment of specifically military colonies by Greek *poleis* was rare. The Athenians can be said to have done so in their imperial period establishing *klerouchiai* (cleruchies; military colonies) populated by *klerouchoi* (cleruchs; military colonists) across the Aegean on land seized from defeated members of the Athenian *arche* or Empire. Military garrisons became increasingly common in Greek history as the Macedonians established their power, and garrisons if settled in one place long enough become towns and villages—effectively colonies. Many of Philip and then Alexander’s foundations in their conquered territories could be deemed military colonies. Philip’s expanding Macedonian state established colonies that controlled strategic territory. His own foundation of Philippi at the site of Crenides near important mines must have had a military flavor. Alexander’s conquests left military colonies of Greeks dotted across the eastern parts of his empire especially. Many of his settlers, however, were clearly reluctant colonists. Thus, on learning of his death as many as 20,000 foot and 3,000 horse left their new foundations in the east and began the trek home only to be massacred by the Macedonians for their actions (Diodorus 18.7.1–9).

Alexander’s Successors continued the practice of founding cities for their military personnel and civilian immigrant populations. Some of these were specifically military in nature and others as part of more general city foundation. In Antigonid (321–301) and Seleucid (310–283) Asia, military colonies, styled as *katoikiai*, consisted of fighting men of military age settled with their families primarily around the northwestern parts of modern Syria and in the center of the Euphrates-Tigris valleys. Significantly, these colonies laid the foundation for future generations of military servicemen for the Seleucid monarchy. Ptolemy also had military settlers as colonists. He certainly settled men captured in Perdikkas’ invasion army of 321 on military style settlements in the delta and did the

same later when Demetrius failed at Gaza in 312. The Ptolemies also settled men of fighting age in their territories. Veterans found homes in the Arsinoite *nome* as *klerouchoi* on individual military settlements. These men remained liable for military service in return for their land grants, a liability that passed to their heirs. Traditionally, these Ptolemaic cleruchs have been seen differently from the more communal foundations of the Seleucids in their independent, one-off nature. They failed to lay the foundations for future generations of Greco-Macedonian fighting men in Egypt.

Military colonies were often indistinguishable from garrisons and effectively served the same purpose—to establish military control of an area. They could be effective in this, especially in the Archaic and Hellenistic Periods, where they also served to spread Greek language and culture (although the cultural transmission was both ways). However, in the Classical Period, when earlier used to control other areas of Greece they were generally very unpopular. The fifth-century Athenian system of cleruchies was so hated that when the Athenians set up their Second Athenian Confederacy in the fourth century the alliance agreement specifically banned the practice.

Comics and Graphic Novels, Greek Warfare in

Comics and Graphic novels are, by their very nature, art forms of

modernity. As such, they typically focus on the present or immediate future. Comics, therefore, rarely draw thematic content from the Classical past and representations of Greek warfare within the medium are infrequent. The significance of Classical Greek literature to Western civilization, however, has meant that some aspects of Greek warfare have found representation within the comics, if only by inclusion in titles reinterpreting Homer. Most recently, comic books have tended to shadow the success of motion pictures featuring similar themes and, when these films have depicted Greek warfare, the comics have followed suit.

Greek gods have appeared frequently in comics since the earliest days of their production. William Moulton Marston's 1941 creation, Wonder Woman, was an Amazon princess and her contingent mythos exploited several aspects of Classical Greek legends, including her ongoing conflict with Ares, who was first introduced as a character in 1942. Marvel Comics similarly experimented with the Greek pantheon and introduced Hercules, initially as a villain in issue 10 of *The Avengers* (1964), but later as a hero in the first issue of *Journey Into Mystery* (1965). Hercules, Ares, and even the Amazons themselves were Classical superheroes or super-villains operating within a modern world, though, and were not meant to be representative of Classical Greece.

Among the earliest representations of Greek warfare in a comic book format are the Classics Illustrated editions of the *Iliad*, the *Odyssey*, and the *Aeneid*. A Russian immigrant to the United States, Albert Kanter, began Classic Comics in 1941 as a way of bringing literature to a wider audience. The company changed its name to Classics Illustrated in 1947 and eventually relocated its base of operations to the United Kingdom during the early 1960s. Classics Illustrated produced *Homer's Iliad* in 1950 and followed it up with an edition of *The Odyssey* the following year. *The Aeneid* was published only after the company had moved to the United Kingdom and did not appear in a U.S. edition until 2007.

In 1998, Frank Miller produced the five-issue limited series *300*, which dramatized the battle of Thermopylae (480). Miller's direct inspiration was the Rudolph Maté 1962 film *The 300 Spartans*, but *300* also featured quotations from Herodotus' *Histories*. The series was later reprinted as a graphic novel and achieved iconic status after its translation into film by Zack Snyder in 2007.

Although Eric Shanower had begun work on his own vision of Homeric

Greece in the early 1990s, it was not until 1998 that the first issue of the highly successful *Age of Bronze* found publication. Drawing together traditions as disparate as Homer's *Iliad* and Shakespeare's *Troilus and Cressida*, Shanower incorporated historical and archaeological research to create a series that he envisages running for as many as 70 issues.

Following the commercial, although not critical, success of Oliver Stone's *Alexander* in 2004, Rob Shone, Anita Ganeri and Chris Odgers produced the non-fiction graphic history *Alexander the Great: The Life of a King and Conqueror* in 2005. Wolfgang Petersen's 2004 production of *Troy* led to a similar revival of interest in the Homeric epics. From 2007, Marvel Comics produced *The Iliad* (Roy Thomas and Miguel Sepulveda) and *The Odyssey* (Roy Thomas and Greg Tocchini), each in eight issues, followed in 2009 by Thomas and Sepulveda's *The Trojan War*.

In 2013, Image Comics, the same company that produced Shanower's *Age of Bronze*, began publication of a five-issue series set in fourth-century Sparta. The miniseries, entitled *Three*, was a self-conscious exploration of Spartan militarism, but where Miller's *300* had been reverent of this tradition, *Three* was sharply critical. The creators of *Three*—Kieron Gillen, Ryan Kelly, Jordie Bellaire, and Clayton Cowles—enlisted the help of University of Nottingham professor Stephen Hodkinson in researching the comic and the end result reflects current academic trends in questioning the reality of Spartan invincibility and the legitimacy of institutions such as the *crypteia*.

Command Structures, Army

Building a coherent picture of Greek military command structures is difficult. Structures differed between states and regions, developed over time, and the evidence for them is patchy. It is also important to note that ancient armies lacked anything like the command structures of more modern armies or any officer training other than on the job experience. However, ancient warfare generally revolved around large set-piece engagements or sieges and there was less need for sophisticated command and control structures than today.

In the earliest depictions of Greek warfare, in Homer, command was simply exercised by king or chieftain. The accuracy of Homer's picture of the period he represents, as opposed to his own times, is debated, but the command structure depicted seems inherently likely for what were essentially local war bands. These were small and a formal subordinate hierarchy unnecessary. When larger forces were gathered, such as for the Trojan expedition, each contingent had its own commander, with an overall commander. The soldiers could be gathered in an assembly to hear the leaders speak but apparently with no opportunity for real input. Command authority was based on the leader's *arête* and position.

Hoplite warfare devolved military service lower down into a community and armies now represented a larger proportion of the population. This, and the requirement for greater discipline, increased the need for a hierarchical command system. In most cases, this led to formalizing the commander's position and creating subordinate commanders roughly equivalent to unit and subunit command in more modern armies. In democracies and mercenary armies, these positions were

often elected.

Most of our evidence for the hoplite period comes from Athens and Sparta, both atypical. Sparta, which alone had a truly professional army, had the most sophisticated command system. Unfortunately, the details are hard to recover. Thucydides provides a description of the Spartan army at Mantinea (418) and Xenophon does the same for Leuctra (371). However, their accounts are not entirely consistent, perhaps because of different knowledge (or terminology), corruption in the text, an organizational change between the two dates, or a combination of all these. The army was generally commanded by one or both of the kings, although after Agis II's poor performance in 419–418 he was accompanied by a board of advisers. For most of the Classical Period the army apparently consisted of six units of infantry, each about 600 strong. Prior to the end of the fifth century six polemarchs (*polemarchoi*; sing. *polemarchos*) may have formed a council of war with the king with no direct command function. The six hoplite units, probably (but not definitely) called *lochoi* (sing. *lochos*) were each commanded by a *lochagos* (pl. *lochagoi*).

However, by the early fourth century, these units were called *morai* (sing. *mora*), each commanded by a polemarch. At this time, each *mora* consisted of four *lochoi* commanded by a *lochagos*. A *lochos*' internal structure had two subordinate officers (*penteconteres* or *pentecosteres* [sing. *penteconter* or *pentecoster*]), each commanding two other subordinates, (*enomotarchoi* [sing. *enomotarchos*]). After Leuctra, the term *mora* disappears, although the 12 *lochoi* continue. This is perhaps because the army was downsized and restructured after the losses at Leuctra. Before Xenophon, Herodotus and Thucydides both use the term *lochos*, not *mora*, for the units in the Spartan army.

At Athens, prior to Cleisthenes' reforms (ca. 508/7) the army was commanded by a polemarch. After Cleisthenes, a board of 10 *strategoi* (generals) exercised command. They were elected, served for one year (but could be reelected without any restrictions), and commanded both by land and sea. It was relatively common for two or more *strategoi* to command an army (or fleet). Below the *strategoi*, were 10 taxiarchs (*taxiarchoi*; sing. *taxiarchos*) also elected and each of whom commanded a 1,000-strong hoplite contingent mobilized from his *phyle* (tribe). Each *taxiarchos* had 10 *lochagoi* beneath him, each commanding 100 men. Sometime between 445 and 438, the Athenians reorganized their cavalry under 2 elected hipparchs

(*hipparchoi*; sing. *hipparchos*) and 10 phylarchs (*phylarchoi*; sing. *phylarchos*)—also elected and each of whom commanded the 100-strong cavalry squadron from his tribe. A hipparch could command half the cavalry (500 men) or a smaller contingent of two or more squadrons. Xenophon's *Cavalry Commander* argued for a formal structure below this but there is no evidence that this was ever implemented. Both hipparch and taxiarch were subordinate to the *strategos* (or *stratego*) on campaign.

Athens was very big, though, and the only similar sized armies we know anything much about are those of leagues or federal states. The Boeotian League army ca. 395 was slightly bigger than the Athenian army. It was based on the League's 11 districts, and the 11,000 League hoplites and 1,100 cavalry were commanded by 11 boeotarchs. The Achaean League had one *strategos*—the commander-in-chief—and men could not hold the office two years in a row. Prior to 255, there seem to have been two *stratego*i, so the command structure clearly changed over time. In the cases of both the Boeotian and Achaean Leagues, we simply do not know whether the individual member states had a similar system, or what the league structure was below the higher echelons.

The Macedonian army under Philip II and Alexander the Great, and the armies of the *diadochoi* or Alexander's Successors, were commanded by the king, although detached forces could be commanded by trusted generals. The Macedonian army was recruited, organized, and commanded on territorial lines. The six *taxeis* (brigades; sing. *taxis*) of the *pezhetairoi* (foot companions), comprising 9,000 phalangites, formed its core; each *taxis* was commanded by a taxiarch and had sub units called *lochoi*. The 3,000 strong hypaspists were divided into six *lochoi*, each commanded by a *lochagos*. The cavalry consisted of five 200-strong squadrons (*ilai*; sing. *ile*) and the Companion cavalry squadron of 400 men, each commanded by an iliarch. After Gaugamela (331), however, Alexander reorganized the army so that each cavalry *ile* was internally divided into two *lochoi*, an additional *taxis* of *pezhetairoi* was added, and he grouped the *lochoi* into larger bodies of around 1,000 men, commanded by a chiliarch (*chiliarchos*; "leader of 1,000").

Under the *diadochoi*, the Macedonian components initially kept their existing command structures. However, influenced by local structures, and the need to increase the number of local troops as the Macedonian component declined, over time the organization changed and differences between the successor kingdoms emerged.

Although rudimentary by modern standards, from the Classical Period on, Greek armies did have a clear cut command structure with commanders at roughly equivalent levels to modern brigades, units, and subunits (noting that these differ in size between modern armies). It was unusual to find a structure below that level, with the exception of Sparta.

Command Structures, Navy

Navies were commanded at three levels: by generals/admirals on campaign, by the same generals/admirals and their subordinate commanders during battle, and individually aboard each ship by the *trierarch*, or captain.

In Athens, 10 generals (*strategoî*) were elected annually to serve both on land and at sea, although by the fourth century they became more specialized in their duties. In Sparta, the two kings served as generals on land and an admiral was appointed to serve at sea in command of naval forces. This admiral could only serve in the post for one year, but when the successful commander Lysander's term finished he was appointed "vice-admiral" and in reality was still in command. These military commanders often operated far from their home bases and so they had a large degree of autonomy on campaigns. However, the fickle Athenian democracy did not tolerate what they perceived to be failure and many generals were

punished, including the historian Thucydides. Nicias' letter from Sicily (Document 12) illustrates the effect the fear of failure and punishment could have on *strategoi*.

During battle the generals/admirals and subordinate commanders would control squadrons of ships. During the battle of Salamis in 480 the Greeks were under the command of the Spartan Eurybiades, who set out the battle line, but each individual city-state controlled their forces during the battle. Ships were usually divided into squadrons that maneuvered individually during battle and pursuits, and these squadrons were not necessarily directly commanded by the elected or appointed generals.

In one incident the Athenians withdrew as one disciplined force to keep the victorious Spartans from pursuing the defeated fleet of Corcyra, a maneuver requiring tight and disciplined command and control (Thucydides 3.78). Naval battles required swift and effective maneuvering to utilize weather conditions and for favorable positioning to conduct ramming attacks, and as such they were not merely land battles fought afloat.

Each trireme had a captain, known as a trierarch, who in Athens was also responsible for the outfitting and maintenance of the ship for an entire year. Toward the end of the Second Peloponnesian War, as Athens' wealth dwindled, this duty was often split between two citizens. In the fourth century the Athenians passed a law creating a pool of potential contributors to undertake this role. The quality and experience of the trierarch had a large impact on how naval forces performed during battle.

A good illustration of the breakdown of command comes from the conflict between Corcyra and Corinth in 433. The Corinthians and the five allied contingents had their own officers, and the Corinthian admiral in overall command of the force had four subordinate commanders. The Corcyraean force opposing them was commanded by three admirals, and the Athenian contingent attached to them had three commanders, all commanding different sections of the line.

Commemoration

Greek commemoration of war took many forms and fulfilled a number of purposes, ranging from a triumphal desire to display one's victory to a communal sharing of loss. Obviously part of remembering and commemoration lay in story-telling, and no doubt survivors of wars were asked repeatedly to describe their experiences. The desire to fix events in memory could be a stimulus to historical narrative: Herodotus opens his history by stating that part of his purpose is to ensure that the great deeds of Greeks and barbarians are not forgotten. Greek historians wrote much about wars, but generally say little about the details of real battles: for graphic descriptions of the physical nature of Greek warfare, one goes best to the fictional battles in Homer's *Iliad*. No doubt this reflects the greater ease for a poet making things up than for a historian researching details, but it may also remind us that societies memorializing war are less interested in an accurate account of what happened than in creating and shaping an acceptable shared story that gives it a set of meanings that are deemed useful to the community. This is as true of modern war memorialization as ancient. Any commemoration of war will demand symbols, or rhetoric that produces a highly simplified story.

A basic and universal form of commemoration after a battle was the erection of a trophy by the victorious side. After a hoplite battle, only one side was left in command of the actual field of battle, and thus were the "winners," regardless of strategic consequences. The losers acknowledged defeat by asking for a truce to gather their dead, while the victors emphasized the fact of victory by erecting a trophy: this was a post or tree stump, on which were hung a set of captured armor and weapons. Presumably these were very temporary memorials of victory: they were considered inviolable, but still may not have survived long if the battle had taken place in enemy territory. Trophies were also erected after naval battles, on a prominent piece of nearby land, for example, a nearby

promontory in the case of the battle of Leucimme in 435. In 412/11, after a fairly small but successful battle with the Athenians, the Spartan admiral Astyochus took his whole fleet from Cnidus to the Athenian-held island of Syme (near where the battle had taken place) so that he could set up his trophy in enemy-held territory.

There was a view, though it seems to come from later sources, that the fragile and thus temporary nature of battlefield trophies was a virtue, because there should not be permanent memorials of victories by Greek over Greek. But some monuments were more durable. After the defeat of the Persians in 479, out of the spoils the Greeks set up a golden tripod supported by a three-headed bronze snake at Delphi, along with large bronze statues of Zeus at Olympia and Poseidon at Isthmia. (The bronze snake was later taken to Constantinople, and can be seen today in the hippodrome in Istanbul.) In the Agora at Athens, the *Stoa Poikile* (Painted Stoa) housed several paintings of battles, including Marathon and Oenoe, alongside scenes from Troy and battles with Amazons. Large scale monuments on battlefields seem rare, though examples exist. The Thebans built a round, tower-like building, in effect a substantial permanent stone trophy, at Leuctra to commemorate their victory over the Spartans in 371. But this building, now reerected (see illustration in Leuctra, Battle of), may belong to the third century, another example of historical commemoration. And at Chaeronea, a large stone lion was erected to guard a group of remains, possibly those of the Theban Sacred Band.

After a battle, many cities would bury their dead on the battlefield, though normal Athenian practice seems to have been to cremate the dead and bring their bones home. A tomb on a battlefield would also serve as a form of memorial. Even the Athenians did this at Marathon in 490 and Plataea in 479, no doubt marking there that these victories over the Persians were of particular significance. At Marathon, the 192 Athenian war dead were buried under a large mound, the *soros*, still visible today. The Plataeans who fought at Marathon similarly were buried on the field, as were other Greeks at Plataea (the Spartans in three separate tombs, for priests, Spartiates, and helots). This was such a public form of commemorative statement that Herodotus tells us that cities that had not fought at Plataea built mounds on the battlefield to pretend that they had, while the Aeginetans, who had fought, constructed a dummy mound 10 years after the event, when perhaps they thought memories might be

fading.

Stripping arms from the enemy dead was an old-standing practice, well attested in Homer (see also first illustration in Hoplites entry). It would be open to soldiers to keep and even use these themselves, but often they would be dedicated in a sanctuary, in effect as a long-term and very publicly visible form of trophy. They might remain on display for a very long time. In 340, according to Aeschines' account of the outbreak of the Fourth Sacred War, the Thebans and their supporters in Amphissa were upset because the Athenians had affixed to the new temple, before it had been consecrated, some shields with an inscription: "The Athenians, from the Medes and Thebans, when they made war on the Greeks." The religious niceties were surely less important to the Thebans than the Athenians' determination to keep reminding visitors to Delphi that in 480, 140 years before, the Thebans had medized.

Each city had its own practice regarding treatment of their own war dead. Spartan tradition held that the law-giver Lycurgus had prohibited inscriptions on gravestones, except for those who had died in war. Quite a number of Spartan grave inscriptions have been found, generally with the man's name (with no patronymic or other identifier) and the words, "in war." The gravestones themselves are simple, unimpressive, and austere, range in date from the fifth to the first centuries, indicative of a long continuity of practice, and come from all over Laconia. Their wide scatter suggests that they may have been the focus for families' commemoration of their dead (e.g., as a place to make offerings), as well as a site for mourning.

In other cases, Spartans buried their dead in mass graves—*polyandria*—out in the world beyond Laconia. Pausanias saw what purported to be the graves of both the Spartan and the Argive dead in the Battle of the Champions of about 547, nearly seven centuries before his own time. Sometimes the dead were moved to friendly territory, especially to places with links to why Sparta was fighting: examples are the burial of Lysander at Panopeus in Phocis, and of the dead from the battle of Mantinea in 418. In 427, Thucydides has the Plataeans remind the Spartans of the honors that they—the Plataeans—have paid to the graves in their territory of Spartans killed there in 479.

At Thermopylae, memorials to the battle of 480 jostled for space. Herodotus tells us that the Spartan dead were buried where they made their final stand, and there were a number of inscriptions set up over them, not

by the Spartans themselves but by the Delphic Amphictyony. But Strabo in the first century reports seeing five grave markers, two of them honoring the Opuntian (Eastern) Locrians and possibly the Thespians. Most interestingly, sometime around 440, 40 years after the battle and perhaps at a time when they wished to remind people of the prestige acquired in the Persian War, the Spartans brought back what purported to be the bones of Leonidas and buried them at Sparta. Pausanias reports that in his day this was the site of ceremonial speeches and athletic contests, and that there was also an inscribed list of all the 300. In this case, 40 years after the event, we can possibly see a military defeat being recreated as a heroic enterprise, to bring prestige on the state.

Athens is the state where the forms of military commemoration are best attested. As noted above, typical Athenian practice was to cremate bodies on the battlefield and then repatriate the bones and ashes. These were then buried in an annual public funeral, held in winter. Thucydides gives us an excellent description. For two days the bones were laid out in a tent, allowing families to bring offerings. On the day of the funeral itself, the bones were separated (how, we cannot know) according to the one of the 10 civic Athenian tribes to which each man belonged. The bones for each tribe were placed in a coffin (*larnax*) of cypress wood, and carried on wagons to the public tomb, the *demosion sema*, in the Cerameicus, the potters' quarter just outside the walls which was the main central Athenian cemetery; in addition, an empty bier represented the missing. It was a funeral for the families, with women lamenting the dead in traditional ways, but also for the state; citizens and foreigners alike could attend.

Three further rituals followed. An orator would make a speech to commemorate the dead. Very few are extant; the most famous, Pericles' Funeral Oration, is unlikely to be at all close to the original; Thucydides uses it to express his own, or Pericles', or Athenians' views of what made Athens worth fighting for. Second, there were athletic contests in honor of the dead, a ritual that goes back to Homer: as in many areas, the democracy took on the forms of aristocratic ritual. Finally, it became the practice in the fifth century to set up an inscribed list of the war dead for each year. Typically these listed men without identifiers such as father's name or name of deme, but grouped again according to the 10 civic tribes, emphasizing the men's place in the structure of the *polis*. These two facets may have been intended to signal the men's equality in death, or simply to emphasize that the most

important fact about a man who died for the city was his role as a citizen, rather than, for example, as a family member. In this it may be seen as similar to somewhat anonymizing forms of Spartan burial of the dead.

Common Peace (*Koine Eirene*)

The term “Common Peace” (*koine eirene*) was used by Greek writers to refer to a peace treaty that applied generally in the Greek world, as distinct from a peace treaty between two states, or groups of states. Common Peace treaties could be described as “multilateral” and were, in theory, open to all Greek states, great and small alike, even if they had not themselves been involved in the relevant hostilities. The concept of Common Peace was an important diplomatic goal in the interrelations of Greek states in the fourth century and is found both in some contemporary sources and in later sources dealing with this period (e.g., Diodorus). Common Peace could refer to a real settlement or be no more than a slogan. Significantly, Xenophon in his *Hellenica* does not use the term although he deals with many of the relevant events. After the fourth century the term was only of minor

importance.

The idea of a peace treaty that would include a large number of states and provide security for a defined region came to the fore in 424 at a conference at Gela where the Syracusan leader Hermocrates persuaded the cities of Sicily to adopt such a plan (Thucydides 4.65). The actual term Common Peace was not used on this occasion but is first attested during the Corinthian War (395–387/6), when in 392/1 there were abortive peace negotiations. The King's Peace (387/6) that ended this war was the first Common Peace formally described as such. The term was also applied to later treaties: the peace of 375/4, the peace treaty made at Athens in 371, the peace made at Sparta in the same year, the peace of 362/1, and the "League of Corinth" (Philip II of Macedon's settlement of Greece) in 338/7, Alexander the Great's renewal of this in 336, and lastly a peace treaty established for the Greek cities by the agreement in 311 made by Antigonus I Monophthalmus, Cassander, Lysimachus, and Ptolemy I Soter.

There were other instances where Common Peace was the subject of negotiation, if not actually put into practice. In 366, Boeotia invited states to a conference at Thebes for a Common Peace treaty. Various states, including Athens, Corinth, and Arcadia objected, and it is not clear if the project came to nothing or resulted in a Common Peace that included only a limited number of states. In 346, during negotiations that led to the Peace of Philocrates, the members of the Second Athenian Confederacy other than Athens proposed that the treaty between Philip and his allies on one side and Athens and its allies on the other be in the form of a Common Peace that any state could join (Aeschines 2 [*On the False Embassy*] 57). This proposal lapsed, and there is no good reason to accept (on the basis of Diodorus 16.60) that there was a Common Peace treaty in 346.

In harsh reality, Common Peace treaties rested upon compulsion or the threat of it by the leading powers. Thus the King's Peace (387/6) was enforced by Sparta, then supreme in Greece and backed by Persia. The Peace of 375/4 depended on the agreement of Sparta and Athens. The Peace of Athens and the Peace of Sparta (371) both contained the novelty of a guarantee clause, that is, an undertaking that any states that so willed could take part in joint action against any party transgressing the treaty.

The Peace of 362/1, which followed on the stalemate resulting from the battle of Mantinea, included the obligation (not followed in practice afterward) on all parties to act against transgressions. Macedonian power

dictated the Common Peaces of 338/7, 336, and 311.

The establishment of a Common Peace was not a matter of course. Threats were needed to make Thebes and Argos-Corinth accept the King's Peace (387/6). Elis refused to take part in the peace of Athens (371). More spectacularly, Boeotia refused to take part in the Peace of Sparta (371). Many Greek states, including Athens, sat back to let Sparta enforce the treaty. The outcome was the battle of Leuctra, which changed the course of Greek history.

Common Peace treaties included provisions for the autonomy of those states participating, which in itself was a cause of dispute. For example, Elis rejected the Common Peace of Athens (371) because it recognized the autonomy of Triphylia and other territories Elis claimed (Xenophon, *Hellenica* 6.5.1). Even participation by a state could be controversial. Most notably, the admission of Messenia to the Common Peace of 362/1 meant that Sparta alone refused to join in the treaty, because Sparta could not acknowledge the existence of Messenia as a free state.

Conon (ca. 444–392)

Conon, son of Timotheus, was an Athenian *strategos* (general) active during the later stages of the Second Peloponnesian War (431–404) and important

in Athens' revival in the early fourth century. Although commanding 18 triremes at Naupactus (414/3) his first major command was as Alcibiades' replacement after Notium (406). More concerned with combat effectiveness than appearance, he reorganized the crews of 100 undermanned triremes to fully man 70. Outnumbered in ships 170:70 by the Spartan Callicratidas, Conon withdrew to Mytilene, losing 30 triremes in a battle near the entrance to its harbor. Importantly, given Athens' shortage of trained crews, all the sailors escaped. Blockaded, Conon used a stratagem to get ships away to inform Athens; the blockade ended when the relief fleet inflicted a major defeat on Callicratidas at Arginusae. Conon's final service in the war was at Aegospotami (405)—the disastrous final Athenian naval defeat. The fleet was surprised with the crews scattered searching for food, but Conon, perhaps because of better discipline and security, managed to get eight of his ships away along with the state trireme, the *Paralus*. He ensured a clean break by seizing the enemy's cruising masts (used for distance travel but removed prior to combat) from a nearby headland.

Fearing the reception for a defeated general at home following the execution of the generals after Arginusae, Conon took his ships to Cyprus. After the war, Conon served with the Persians, especially the satrap Pharnabazus. Together, they destroyed Sparta's new naval superiority in the Aegean and seriously weakened its position in Asia Minor. Their partnership resulted in the major Spartan naval defeat at Cnidus (394), followed up by sailing along the Asian coast, expelling all the Spartan harmosts (governors). They then switched their attention to Greece, where they ravaged the coast of Laconia and established a permanent base at Cythera to raid the Peloponnese. Conon then persuaded Pharnabazus that he could damage Sparta and ease pressure on Persia by rebuilding Athenian power. Pharnabazus gave him the fleet and Conon returned triumphantly to Athens, where he rebuilt the Long Walls and brought cities from Ionia and the islands into alliance with Athens. Conon was seized by the Persian satrap Tiribazus while on an embassy to Persia (apparently because of Spartan pressure and Persian fear of a resurgent Athens). Although he probably escaped, he died soon afterward (ca. 392).

Contracts, Military

In the Archaic Period, traditional forms of *xenia* or ritualized friendship created informal bonds akin to contractual relationships during service, including distribution of booty. No written contracts, however, exist until the Hellenistic Period. The most significant extant written contract is an inscription *OGIS* 1.266 (Document 20) dating sometime between ca. 280 and 240 and set up in several sanctuaries in the vicinity of Eumenes' emerging kingdom including the one to Athena at Pergamum, Apollo at Gryneion, and the islands of Delos (Apollo) and Mytilene (Asclepius). It outlines the settlement of a dispute between Eumenes II of Pergamum and his garrisons at Philetaerea and Attalea. It is in effect a contract between the two parties. In it Eumenes agrees to pay a set amount each month, and to make a back payment, presumably from the time of the dispute; not to attempt to make the men serve for an additional intercalary month; to exempt those unfit for service; to look after orphaned children of his command; and to allow the men to leave with all their property after serving a set number of years, probably 40, with immunity from taxation. In many ways, this written document has many precedents that go back into the Greek past.

Employers and men, especially mercenaries, regularly agreed terms of service at the start of a campaign of payment amounts and booty redistribution, and to where they would be led and against whom they would fight. At a higher level, terms of employment of troops supplied by allies also appear in interstate agreements, which effectively form contracts. One example is in the alliance between Athens, Argos, Elis, and Mantinea in 420. The latter stages of the Second Peloponnesian War also provide several examples of agreements between Persia and the Peloponnesians to

pay sailors serving against Athens.

Corcyra, Conflict with Epidamnus and Corinth (435–433/2)

This conflict was one of the triggers for the Second Peloponnesian War (431–404) and also sheds light on the relationship between colony and mother city. Its origins were in a civil war between oligarchs and democrats in Epidamnus, a colony of Corcyra—which in turn was a colony of Corinth. As was traditional, when Corcyra founded Epidamnus, Phalius, the *oikistes*, or leader of the expedition was drawn from the original mother city, Corinth. In this case, the colonizing expedition also included settlers from Corinth and elsewhere.

By 435, after a period of internal *stasis* or struggle, the democratic party had expelled the ruling oligarchs. These allied with the local non-Greek population (Thucydides 1.24 calls them *barbaroi*) and harassed the city. Epidamnus appealed to Corcyra to mediate with the exiles and help them against the locals. When this was refused the desperate democrats consulted the Delphic Oracle about handing themselves over to Corinth for protection. The oracle advised them to do so and the Corinthians accepted the offer. They were motivated, according to Thucydides, by both feelings of responsibility to their colony Epidamnus, and hatred for the Corcyraeans, whom they regarded as treating Corinth with gross disrespect. The Corinthians made energetic preparations, calling for new settlers for Epidamnus and raising an army.

When the settlers and soldiers arrived, Corcyra reacted very strongly, demanding the new arrivals withdraw and Epidamnus restore the exiles. This was refused and Corcyra attacked Epidamnus. Corinth raised another large expedition of soldiers and settlers, at which point Corcyra offered to

go to arbitration. As often happened in such cases, the two sides could not agree on the preconditions—the Corinthians would only agree if the Corcyraeans withdrew their besieging force and Corcyra would only agree to this if the Corinthian garrison and new settlers also left Epidamnus. The Corinthian fleet sailed and suffered a decisive defeat in a scrappy engagement at Leucimme (435); the Corcyraeans executed all the captives, except the Corinthians. The same day Epidamnus surrendered.

This victory gave Corcyra mastery of the area and they ravaged the territory of several Corinthian allies. Corinth's response was to rebuild its fleet and prepare to renew operations. During the abortive negotiations prior to Leucimme, Corcyra had threatened to seek new allies if they failed. Worried by Corinthian preparations and that they were not a member of either the Peloponnesian League (as Corinth was) or the Delian League, they asked to join the latter.

Thucydides provides versions of the Corcyraean and Corinthian speeches at Athens about this request. After initial reluctance, the Athens agreed to the alliance. They were convinced that it was legal under the terms of the peace that had ended the First Peloponnesian War and, according to Thucydides, saw war with the Peloponnesian League as inevitable and wanted the large Corcyraean fleet on their side. Athens dispatched a fleet that became involved in a naval clash between Corcyra and Corinth (433/2). This led to a breakdown in Athenian-Corinthian relations, provoking further action against each other (notably at Potidaea) and contributing to the outbreak of the Second Peloponnesian War in 431.

Corcyra, Corcyraeans

Corcyra, modern Corfu, is a large and strategically located island in the Ionian Sea, between Italy and Greece. In comparison to the other islands of the Ionian Sea, it enjoyed a relatively lush climate, well suited to agriculture, as well as an advantageous position on the common trade route between Greece and Italy. In prehistoric times the island was generally culturally closer to the north (e.g., Illyria) than to the Greek mainland, and in the Neolithic and Bronze Age it was devoid of any Mycenaean influences at all. The earliest contacts with Greece are found in the first colony on the island, traditionally originating from Eretria on Euboea. According to the foundation myths, these colonists were expelled in 734/3 by settlers from Corinth who were en route to Sicily to colonize Syracuse. The earliest Greek archaeological remains on the island confirm the presence of Geometric pottery during the eighth century, although there is no clear evidence of an earlier colony, and no Euboean influence on the island.

Thucydides relates how, in around 660, the Corcyraeans fought their mother city and defeated them in a naval battle, although the Corinthians asserted their dominance over their erstwhile colony soon after. Later in the seventh century, the two cities were founding Epidamnus and other joint colonies in Illyria. After the death of Periander, the tyrant of Corinth, Corcyra permanently broke ties with its founder and entered into direct competition with Corinth for control of the trade routes in the west. According to Herodotus, Corcyra sent 60 ships to help the Greek cause at Salamis (480), but they deliberately waited off the Peloponnese, claiming to be prevented from sailing by contrary winds, until they saw what the outcome of the battle would be.

In 433, Corcyraean and Corinthian conflict over Epidamnus was one of the causes leading to the outbreak of the Second Peloponnesian War, with Athens and Corinth coming into direct conflict at the battle of Sybota. During the course of that war, Corcyra relied heavily on protection from the Athenian fleet in 427 and 425 to remain independent from Corinth. The war led to the intervention of Athenians, Spartans, and Corinthians in the local politics of the island, causing violent civil strife amongst the Corcyraeans,

which only ended in 425 with the democrats massacring their oligarchic opponents. Corcyra broke ties with Athens in 410, although it later joined the Second Athenian Confederacy in 375. This led to a short siege by the Spartans, successfully resisted by the Corcyraeans in 373. During the late fourth century, Corcyra vainly resisted Macedonian influence in the Adriatic, and was fought over by successive Hellenistic dynasts, such as Cassander, Demetrius I Poliorcetes, and Pyrrhus. In 229, it was occupied by the Illyrians who were swiftly ousted by the Romans. The island became a Roman naval base until it was attached to the province of Macedonia in 148.

Corcyra, *Stasis* at (427)

Corcyra (modern Corfu) is the northernmost of the western Greek islands located in the Ionian Sea just off the west coast of Epirus and the site during the Peloponnesian War in 427 of one of the most destructive and brutal instances of *stasis*, or internal strife, in Greek history of the Classical Period. While *stasis* could erupt from a variety of internal conflicts, our sources depict the *stasis* at Corcyra as a consequence of severe ideological divisions

in the citizen body between those who favored a democratic constitution (power shared amongst all adult male citizens) and continued alliance with Athens, and those who favored oligarchy (rule of an elite minority) and wanted to align the city-state with Sparta.

The violence at Corcyra began in 427 with the murder of the leader of the democratic faction in the city and 60 of his supporters by a group of oligarchs who had recently returned from exile. In the chaos that followed, these oligarchs seized power and repudiated the alliance with Athens, presumably as a prelude to an alliance with Sparta, with whom the Athenians were at war. Predictably, more violence ensued when the people (*demos*) rose up in arms. It is said that slaves and women took part in the battles that ran through the streets of the city. Shortly thereafter both Athenian and Spartan fleets arrived and each attempted to intervene, but eventually both the Athenians and Spartans retired without having appreciably influenced events. In the end, with the withdrawal of all foreign forces, the people massacred all those of the oligarchs who remained in the city, including dozens who had taken refuge at the sanctuary of the goddess Hera.

Thucydides' history of the Second Peloponnesian War (431–404) portrays the *stasis* at Corcyra as a paradigm of the Peloponnesian War as a whole, with hopes of political advantage and self-interest overthrowing all moral conventions: sacred spaces are violated, promises and oaths are broken, social obligations and family ties are ignored, unthinkable atrocities are committed.

Even though the people had risen in revolution and achieved victory to maintain the alliance between Corcyra and Athens, the treaty was repudiated in 410 anyway. Corcyra remained unaligned until at least 375, when renewed political tensions between democrats and oligarchs in the city moved them to realign with the Athenians.

Corinth, Corinthians

Corinth was one of the largest and wealthiest cities in Greece, though generally it was more muted in its imperialist ambitions than cities such as Athens, Sparta, and Thebes. It occupied a highly strategic position, astride the western end of the Isthmus of Corinth. With harbors at Lechaëum on the westward-facing Gulf of Corinth and Cenchreae on the Saronic Gulf (which opened out to the Aegean), Corinth was well placed to trade with the whole of the Greek world. Its own territory was about 350 square miles, abutting Megara to the east, Sicyon to the west, and separated by hills from the Argolid to the south. The city was located about one-and-a-quarter miles inland, at the foot of the imposing mountain, the Acrocorinth, which though about 1,600 feet above the city itself provided it with its acropolis (see illustration). The 7-mile circuit of the city walls enclosed an area of 1,500 acres, making Corinth the largest city in Greece. There were also Long Walls connecting the city with the harbor at Lechaëum. The population in the fifth century has been estimated at 70,000 (including slaves and non-citizens).

Corinth was a foundation of the Greek Dark Age, perhaps around 900. The city started to become prominent in the late eighth century, from which point its wide trading ties are demonstrated by the spread of Corinthian pottery, which was dominant until being overtaken by Attic styles in the late sixth century. Corinth was also a significant colonizer, with Potidaea, Corcyra, and Syracuse among its most important foundations. Apart from Potidaea in the northern Aegean, the primary sphere of Corinthian interest seems to have been in the west, both western Greece and Italy and Sicily, areas made easy to reach by the city's direct access to the Corinthian Gulf. Although Corinth had a substantial agricultural territory, its wealth may have come primarily from trade. For most of its history, Corinth was an

oligarchy, though from the seventh to sixth centuries there was a period of tyranny under Cypselus and Periander.

A view of the ruins of ancient Corinth. The slopes of the city's high citadel, the Acrocorinth, can be seen to the left. Corinth was one of the greatest cities of Greece, but was utterly destroyed by the Romans under Lucius Mummius in 146. Most of the visible ruins today are from the later Roman town on the site, but some columns of the sixth-century temple of Apollo are visible in the background. (Boris Breytman/[Dreamstime.com](#))

Thucydides paints the Corinthians as the chief proponents of war in the

lead up to the Second Peloponnesian War (431–404), in conflict with Athens at a number of key points and generally desperate to see Athens' growing power curtailed. Although the speeches that Thucydides gives the Corinthians are works of imagination, they presumably reflect his belief that it was Corinth above all, along with Aegina and Megara, which pushed Sparta into war. Immediately before the war, Corinth came off badly in conflict with its former colony Corcyra (which succeeded in obtaining Athenian help) and saw Athens trying to detach a much more friendly colony, Potidaea, from the Corinthian sphere of influence.

But the Corinthians steadily became disillusioned with Spartan leadership. Like other allies, they were unhappy with the Peace of Nicias and did not support Sparta at Mantinea in 418. After the war, they joined together with Sparta's old foe, Argos, and actually contemplated uniting the two cities. They fought against Sparta in the Corinthian War. In the 360s, Corinth sided with Thebes and withdrew from the Peloponnesian League. In 338, a congress of Greek states at Corinth set up a new Hellenic League (often known as the League of Corinth) to fight Persia under Philip II of Macedon. After the Lamian War, Corinth was occupied by the Macedonians and allied with various Successors of Alexander. In the third century, it was critical to Antigonos I Gonatas' control of the Peloponnese. Aratus of Sicyon captured the city in 243, and it joined the Achaean League. Apart from a further period of Macedonian control, when it became known as one of the "Fetters of Greece," Corinth remained in the Achaean League. But at the end of the Achaean War in 146, the Roman Lucius Mummius razed the city, executed the adult males, and sold the women and children into slavery. A century later Julius Caesar refounded the city; most of the remains visible today are from the Roman period.

Corinth and Corcyra, Sea-Battle (ca. 660)

The first recorded sea battle in Greek history was fought between Corinth and its colony, Corcyra. It is briefly mentioned in Thucydides’ account of the development of Greek naval power, in the context that Corinth built the first triremes in Greece. Thucydides provides no details of the battle (including even who won), but records later the ongoing discord between Corinth and Corcyra that contributed to the outbreak of the Second Peloponnesian War.

Corinthian War (395–387/6)

Causes

The Corinthian War was fought between Sparta and its allies on the one side and a coalition of Athens, Boeotia, Corinth, Argos and others on the other. The war was called by this name because after 394 most of the fighting on land was around Corinth.

A mere nine years separated the outbreak of the Corinthian War from

the end of the Second Peloponnesian War in 404. That the belligerents were involved so soon after this 27-year conflict in another major war shows how ready Greek states were to resort to war to achieve political goals. The Corinthian War was not over disputed territory but political and strategic goals.

Boeotia's heavy burdens in the Peloponnesian War left it dissatisfied with its meager gains from the victory, which had reinforced the supremacy of Sparta. Within Boeotia, political leaders who opposed their state's adherence to Sparta and so aimed at changing Boeotia from an oligarchy to a democracy saw war as the only way forward. There was a similarly minded faction in Corinth. Argos was traditionally hostile to Sparta and after 404 had been left isolated and vulnerable. In Athens, there was a desire for revenge and winning back the lost empire: upper class Athenians wanted to recover property outside Attica; lower class Athenians wanted a return to the military and civilian pay that the empire had made possible.

Sparta was determined to uphold its unchallenged supremacy. It had already fought a war of retribution against Elis (400–399?), and there had been recent signs of discontent in Corinth and Boeotia. Sparta did not initiate the war. In 395, leaders in Thebes in Boeotia induced some Locrians to attack Phocis. When Phocis struck back, the Boeotians attacked Phocis, which then appealed to its ally Sparta for help. Sparta seized upon the opportunity to bring Boeotia into line.

Faced with a Spartan invasion, Boeotia persuaded the Athenians to join in by appealing to their imperial ambitions. Corinth and Argos soon joined these two. An added stimulus for these states to go to war came from a Persian agent who passed on money to leading anti-Spartan politicians, although it is unclear at precisely what point his mission took place, and estimates of its importance vary.

Course

At the outbreak of hostilities in late summer 395 Orchomenus detached itself from the Boeotian federal state. Sparta failed in an offensive against Haliartus in Boeotia that was intended to continue the breakup of Boeotia. In the following summer, the anti-Spartan coalition massed its forces at Corinth but did not move quickly enough on its planned invasion of Laconia. A Spartan army under the regent Aristodemus advanced by an inland route to Sicyon and moved eastward to inflict (ca. July, 394) a severe

but not crushing defeat on the coalition in the vicinity of Corinth in what is usually referred to as the battle of the (River) Nemea.

At the same time, the army under Agesilaus II that had been carrying on Sparta's war against the Persian Empire in Asia Minor had made its way back into Greece by the overland route from the Hellespont. This withdrawal was the intended result of the Persian money sent to Greece. Before Agesilaus entered Boeotia from the north, he received news that a fleet under Conon, financed by Persia and partially manned by Greeks, had defeated the Spartan fleet at Cnidus. His army engaged the coalition forces at Coronea but a highly risky maneuver by Agesilaus against the Boeotians turned what would have been a clear victory into an indecisive outcome (ca. August 394).

The two great pitched battles fought in 394 did not bring the war to a conclusion. Both sides now resorted to maintaining limited forces in fortified positions around Corinth. A stalemate resulted, which was not broken by occasional successes on either side, such as the Spartan capture of the Corinthian port of Lechaenum on the Corinthian Gulf or the destruction of a Spartan *mora* (regiment) by the Athenian Iphicrates' brilliant use of peltasts. About this time, Corinth and Argos joined in some close form of political union, perhaps even forming into a single unitary state. Spartan invasions of their territory ravaged the land of Corinth and Argos but did not force a conclusion. The sequence of events in this latter part of the war is not entirely clear and dating of particular events to years is uncertain.

In 392/1, there were abortive attempts at negotiating a peace but no one state was willing to make concessions. A Spartan attempt to win Persian support went nowhere and Sparta resumed its war in Asia Minor but on a much-reduced scale and without much success. Under the leadership of Thrasybulus Athens built up a navy, began to build up alliances with states in the Aegean, and secured control of the Hellespont and Bosphorus. This revival of Athenian imperialism was in the end enough to convince the Persian king to abandon his support of Athens and support Sparta instead.

Sparta had lost its command of the sea and its allies in the Aegean after the defeat at Cnidus (394) and made only limited attempts to support anti-Athenian movements, such as the oligarchs on Rhodes. Sparta was also called upon to undertake campaigns in northern Greece to retain allies—Agesilaus campaigned for two years to assist the Achaeans in a war against the Acarnanians (389–388).

The Corinthian War had come down to a wide range of small-scale actions in diverse theatres, with neither side able to force a settlement by its own efforts. Such developments as Iphicrates' campaign in the Hellespont and Aeginetan raids and privateering against Athens were destructive but not in themselves sufficient to end the war. The breakthrough came when the Spartan navarch Antalcidas assembled a fleet from Sparta's allies, including Dionysius I of Syracuse, and persuaded the Persians to support Sparta. With these resources, he was able to trap the Athenian fleet within the Hellespont, forcing Athens give up the war. The rest of the anti-Spartan coalition could not continue and had to accept the terms of the "Peace of Antalcidas," dictated by Sparta with the backing of the Persian king (387/6).

Consequences

To secure the Persian king's support, Sparta had to agree to cede to him rule over the Greek cities of Asia Minor. Now supreme in the Greek world, Sparta was able to enforce its war aims: principally, the breaking up of Boeotia into separate cities and the ending of the union between Argos and Corinth. Athens was left isolated and Sparta tightened its dominance over its allies. Xenophon commented that this victory made Sparta "more illustrious" (*Hellenica* 5.1.36) than their victory in the Peloponnesian War.

Coronea, Battle of (447)

A land battle fought in western Boeotia in late 447 (or early 446) during Athens' attempt to control the region. Following the overthrow of

Athenian-established democracies in various Boeotian cities, Athens dispatched 1,000 hoplites under Tolmides to restore the situation. Although Tolmides recaptured Chaeronea, a force of exiles from Orchomenus, assisted by others from Locris and Euboea attacked him on his way home. Tolmides and many of his men were killed and the remainder captured. To secure the release of the prisoners, the Athenians agreed to completely withdraw from Boeotia. The defeat undid Athens' success at Oenophyta (457), led to the revolt of Euboea from Athens, and cut the land routes to Locris and Phocis.

Coronea, Battle of (394)

A rather inconclusive land battle fought mid-August 394 during the Corinthian War. The Spartan king Agesilaus II was en route back to aid Sparta after his successful Asian campaign leading troops from Sparta, Greek cities in Asia Minor, and local Greek states such as Phocis and Orchomenus (Boeotia). He had successfully traversed Thessaly when challenged by a coalition force from Argos, Athens, Boeotia, Corinth, Euboea, and Locris. The best ancient account of the battle is by Xenophon, although he is rather pro-Spartan. Xenophon fails to record the numbers involved, other than that the cavalry were about equal, but Agesilaus had a marked superiority in peltasts.

Agesilaus' Spartans on his right wing defeated the Argives and others opposite, but his allied troops on the left were defeated by the Thebans. When the Thebans moved to rejoin the rest of the coalition force Agesilaus adopted the most dangerous course. Instead of letting them past and attacking their rear or flank, he maneuvered his phalanx to meet them head on. Whether this was from over-confidence or a desire to destroy the Thebans (or a mixture of both), it did not succeed as well as Agesilaus clearly hoped. Some of the Thebans (and given Xenophon's generally pro-Spartan attitude, perhaps even many) broke through and escaped. Agesilaus was wounded and, unable to exploit his victory, withdrew south.

Corupedium, Battle of (281)

A battle between Alexander the Great's Successors (*diadochoi*), Corupedium was fought in February 281, near Magnesia on the Sipylus, west of Sardis. It was the last battle between men who had served with Alexander—Lysimachus was over 80, and Seleucus I Nicator was 77. Lysimachus had killed his own son, the popular Agathocles, apparently at the instigation of his new wife, Agathocles' stepmother, Arsinoe. Agathocles' widow, Lysandra, fled to Seleucus' court, accompanied by another of Lysimachus' sons, Alexander (born to an Odrysian mother). They appealed to Seleucus who took advantage of the unrest and defections after Agathocles' murder and invaded.

Unfortunately, very little is known of the battle itself, other than that Lysimachus was killed and his army defeated. After the battle, Lysimachus' son Alexander had some difficulty in persuading Lysandra to return Lysimachus' body for burial. Although the battle seemed decisive at the time, Seleucus' assassination by Ptolemy Ceraunus less than a year later undid his success.

Cos, Battle of (ca. 262–256)

A naval battle between Macedon and Egypt, fought near the Aegean island of Cos sometime between 262 and 256. Its precise date has been the focus of much scholarship but the battle probably occurred after Athens' surrender at the end of the Chremonidean War and before the Second Syrian-Egyptian War. The Macedonian fleet was commanded in person by Antigonus II Gonatas, the Egyptian fleet by Patroclus, admiral of Ptolemy II Philadelphus.

Antigonus sought a conclusive naval battle to confirm Macedonian primacy and to end Ptolemaic influence in the Aegean, and therefore took the opportunity to confront Patroclus and the Egyptian fleet. Evidence for the battle is fragmentary and scarce: ultimately, Antigonus was outnumbered but victorious

Cotys (d. 359)

An Odrysian king who ruled Thrace from ca. 383/2 to 359. He ruled during a period of resurgent Thracian power and extended his reach over the

Thracian Chersonese and other Aegean coastal cities before being assassinated.

Cotys gained the throne by assassinating his predecessor, then sought to strengthen ties with Athens, which already had a long relationship with the Odrysian dynasts. The Athenian general Iphicrates married Cotys' daughter and assisted in his conquest of the Thracian Chersonese, though apparently stopping short of direct actions against the Athenian settlers there.

Furthering the Thracian program of securing and influencing coastal sites in the Aegean, Cotys assisted the Triballi against Abdera. He quashed the Triballi's later revolt (375). At the same time, heterogeneous trading cities such as the Emporium of Pistiros received Cotys' guarantees and protection, demonstrating the close relations between Thracians and resident Greeks in the hinterland.

By 361, to destabilize the kingdom and regain control over the Thracian Chersonese, Athens instigated a revolt against Cotys, led by his treasurer Miltocythes. However, with Iphicrates' and Charidemus' aid Cotys bribed the Athenian commanders and successfully ended the revolt. An uneasy peace with Athens followed, during which Cotys achieved full control over the Chersonese and allied with Phillip II of Macedon. In 359, Cotys was assassinated by two brothers, Python and Heraclides, who received Athenian citizenship and honors for their deed.

Craterus (d. 321)

Craterus was a high-ranking officer in Alexander III the Great's army. He commanded the left wing at the battles of Issus and Gaugamela and later held independent commands in the campaigns in Sogdiana and India.

In 324, he was commissioned to take back from Opis 10,000 time-expired veterans and to replace Antipater as regent of Macedonia. When Alexander died (June 323), he was still on the march in Cilicia. The Macedonian infantry at Babylon insisted that Craterus be made guardian of Philip III Arrhidaeus, their choice for the succession. Craterus took his army into Greece and with Antipater ended the Lamian War in Greece by defeating the Greeks at Crannon (322).

Craterus now cooperated with Antipater, whose daughter he married. It is not known when and how his commission to take over Macedonia was changed, but Craterus accepted whatever arrangement was made. In 321, he and Antipater led their combined armies into Asia Minor. Antipater then moved against Perdiccas and Craterus against Eumenes of Cardia. Craterus was killed in battle against Eumenes but most of his army escaped.

Craterus had been one of Alexander's most trusted and capable commanders. He was highly popular with the rank and file of the Macedonian army but never aimed at personal power. If he had lived he might have moderated the conflicts among the Successors.

[Crete, Cretans](#)

Crete is the largest island in, and forms the southern bulwark to, the Aegean Sea. Its prominence and location encouraged the development and exchange of goods and ideas from Egypt, the Near East, and the Aegean world. During the Bronze Age, through until the seventh century, Crete was both powerful and significant in the development of Greek culture; however, during the Classical and Hellenistic Periods, it was seen as something of a cultural backwater. From around 2000, the island was the site of extensive settlement by an unknown people called the Minoans, who left an archaeological record replete with art, large settlements with extensive structures, a complex social system, and an early syllabic script known as Linear A. These sites, of which the famous palace at Knossos is the largest, have evidence of imported material and luxury goods (such as ivory and jewelry) from Egypt and the Near East. By the end of the Bronze Age, Crete had a distinctly Mycenaean culture and likely exerted some control over islands in the Aegean.

Decentralization and immigration occurred between 1200 and 1000; the last arrivals were Greeks speaking the Dorian dialect. Crete continued to enjoy contacts with both the Levant and mainland Greece, with traders from both regions attested from 900 to 650. During this time, Crete began to undergo orientalization, adopting the alphabet and certain artistic styles that were heavily influenced from Phoenicia. To Homer, Crete was known as the island of a hundred cities, although Crete's dominance and influence waned over the following centuries, leaving the island as something of a cultural backwater during the Classical Period.

During the Hellenistic Period, Crete was wracked by internecine strife and social conflicts, caused by the increase in landless debtors and citizens. This also led to emigration from the island, with Cretans often seeking their fortunes overseas as mercenaries; they became renowned as slingers and archers, serving in Hellenistic armies and often settling down near where they served (especially in Egypt and Asia Minor). Early in the third century, a Cretan Federation was founded by its leading cities, although Knossos and Gortyn continually squabbled over the leadership. Crete also became home to many pirates, and their raids along the coast of Asia Minor led to the outbreak of two wars with Rhodes (in 206–204 and 155–153). At the same time, the Cretan Federation began to disintegrate, as Knossos and Gortyn declared war on Lyttos—the largest Cretan city that was not a member. Civil unrest and political strife enveloped many Cretan cities during the

war, lasting from 222 to 219, with the Federation eventually disintegrating.

The cities of Crete supported Philip V in a new alliance in 217/6 to extend his control over the eastern Aegean, despite war with Rhodes. Ptolemaic Egypt also exerted a heavy influence on the island, with a garrison being installed under Ptolemy VI Philometor. Intermittent conflict continued between Knossos and Gortyn during the second century, and Crete was a renowned home of pirates and slave-traders. Vexed both by Cretan piracy and by Cretan mercenary service in the armies of Mithridates VI Eupator, the Romans decisively conquered Crete in 67.

Crocus Field, Battle of (ca. 353/2)

The Crocion Plain (often anglicized as “Crocus Field”) was the flat plain on the western shore of the Pagasaeon Gulf (the modern Gulf of Volos; the plain is now the site of an airport). The battle of Crocus Field was probably the most important battle of the Third Sacred War. The battle was between the Phocians, commanded by Onomarchus, and the Macedonians, commanded by Philip II, competing for a dominant position in Thessaly; Philip had captured the nearby city of Pagasae shortly before the battle. Onomarchus had 20,000 infantry and 500 cavalry; his army included

Phocians, troops supplied by his Thessalian allies, the Pheraeans, and above all a large number of mercenaries. Philip commanded a Macedonian and Thessalian army of more than 20,000 infantry and 3,000 cavalry. Given the flat nature of the ground, Philip's superior cavalry was decisive, and he won a crushing victory.

An Athenian fleet, commanded by Chares, was off-shore (probably arriving too late to defend Pagasae), and many of Onomarchus' soldiers, knowing that Athens was allied with Phocis, drowned or were killed trying to swim out to it. Diodorus claims that 6,000 of Onomarchus' army were killed, and a further 3,000 prisoners executed after the battle. Onomarchus himself was one of the dead, possibly being crucified by Philip. The victory left Philip undisputed master of Thessaly, and Pherae was quick to submit.

Croesus of Lydia (ca. 595–547)

Croesus was the king of Lydia, the son of Alyattes. Herodotus calls him the first to exact tribute from the Greeks of Asia Minor. Croesus was defeated by Cyrus of Persia, after Cyrus' deposition of Astyages, Croesus' brother in law and Cyrus' own grandfather.

Solon of Athens was reputed to have visited Croesus in Sardis, at the height of the Lydian Empire. His indifference to Croesus' wealth annoyed Croesus, as did his suggestion that you cannot judge a man to be happy until he is dead. However, Solon's advice was demonstrated when Croesus' eldest son, Atys, was killed in a hunting accident.

Croesus is famous for consulting the Delphic Oracle on whether to attack Persia and being told that if he fought Persia, a great empire would fall. Thinking the oracle meant the Persian Empire and not his, he made an alliance with the Egyptian king Amasis, then the Spartans, and invaded Cappadocia, part of the Persian Empire. The first battle at Pteria was

inconclusive, and Croesus withdrew to Sardis to await reinforcements. Cyrus pursued immediately and attacked before this could happen, placing his camels in front of the army to spook the Lydian cavalry. The Lydians ended up besieged in Sardis, which fell because an observant soldier noticed a scalable point on the acropolis.

Croesus was sentenced to death, but was reprieved at the last minute and became an advisor to Cyrus, and later Cambyses (according to Herodotus). It is possible that Croesus was the ruler under whom electrum was separated into gold and silver for minting.

Croton

Croton was a Greek colony located in the “toe” of Italy, on a site chosen for its safe harborage. It was also famous as the place where Pythagoras worked at the end of the sixth century. Croton eventually became one of the most prosperous and prominent cities in Magna Graecia, with walls 12 miles (19.3 kilometers) in circumference. According to conflicting traditions, Croton was colonized by Achaeans in either 733 or 710, under Myscellus of Rhype. The city grew rapidly in importance and influence, sending out and establishing colonies of its own, such as Terina and Caulonia. It expanded its power within southern Italy, often at the expense of its neighbors, dominating neighboring settlements such as Lametium and Scylacium. Allied with Sybaris and Metapontum, Croton attacked and destroyed Siris (c. 540). Despite simultaneously fighting with the native Italian tribes of the hinterlands, Croton went on to betray her former ally and destroyed Sybaris in 510. It was at this point that Croton had reached the height of her power, even sending a ship to the battle of Salamis in 480.

Shortly thereafter, Croton was attacked and defeated by the combined forces of Locri and Rhegium, beginning its long, slow decline. Nonetheless, Croton was still an important city in the region, controlled an extensive territory, and in the late fifth century formed the Italiote League to unify the Greek cities of southern Italy. Depredations by the local Italian peoples—many migrating southward in response to the growing power of Rome—greatly damaged the economic and trade potential of the region. Nevertheless, the city was still well populated when attacked and subjugated by Dionysius I of Syracuse in 379/8. After this, Croton's lands were repeatedly raided by Lucanians and Bruttians, and Taras took over leadership of the Italiote League as the strongest Greek city in southern Italy in the fourth century. Croton was again captured by the Syracusans, this time under Agathocles in 296/5. Successive wars—Pyrrhic and Punic—spelled the end for Croton, with the Romans occupying the city in 277. A revolt during the Second Punic War led to Croton being abandoned, and later being resettled as a Roman colony in 194.

Crypteia

The *crypteia* was a Spartan secret police force whose main function appears to have been to maintain control over the subjugated Helot population. Aristotle suggested that the *crypteia* had been introduced into Sparta by

Lycurgus, the Spartan lawgiver. Although little is known about it, it appears to have been composed of young men approximately 18 or 19 years old not long out of the *agoge* and deemed to be among the smartest of the Spartiates. Upon taking annual office, the Ephors would declare war on the Helots sending members of the *crypteia* to position themselves around Sparta. Armed only with a knife, they were provided with minimal supplies and instructed to kill any Helots seen out at night, and whenever the opportunity arose, to kill any particularly strong looking Helots. It has also been suggested that the institution of the *crypteia* was designed to teach the most capable of Spartan warriors to act alone or in small groups, skills that can be associated with guerrilla warfare and which ran counter to the traditions of hoplite group warfare. This provided an elite irregular unit which, for example, Cleomenes was able to utilize as a reconnaissance and scouting force at Sellasia.

Ctesias (ca. 450–ca. 380)

Ctesias of Cnidus was a physician who was taken prisoner by Persians. His skill as a doctor earned him a respected position as the royal physician for 17 years. Ctesias himself recounted that he treated the wounded King Artaxerxes II at the battle of Cunaxa in 401 (Xenophon, *Anabasis* 1.8.26; Plutarch, *Artaxerxes* 11).

On his return to Greece in the 390s Ctesias published a 27-book *Persica* (*Persian History*) that also dealt with other near eastern kingdoms preceding the Persians. The scale of the work was enormous: compare Herodotus’ nine books. Ctesias also wrote an *Indica* and a geographical work.

Ctesias claimed to have based his history on “Royal Parchments”

(Diodorus 2.32). There is no other evidence, or even any likelihood, that these existed. Nor is there any sign that Ctesias was able to read any cuneiform script or speak Aramaic or any other eastern language.

Ctesias' work survives only in excerpts and in quotations or borrowings. He recounted a suspiciously large part that he played in Greek-Persian affairs in the years 400–397. His accounts of early near eastern dynasties seem based on current legends and he treated with relish the murderous power struggles in the Persian court. He was widely regarded in antiquity as a picturesque liar.

Cumae

Cumae (modern Cuma) was the first Greek colony on the mainland of Italy, founded ca. 740 by Euboeans on the bay of Naples. It was the dominant city in the region of Campania and was the mother-city of a number of other Greek colonies in south Italy.

Etruscan expansion into Campania was checked when Cumae under its tyrant Aristodemus defeated the Etruscans under Lars Porsenna at Aricia in 505. A further Etruscan thrust in 474 was defeated in a naval battle off Cumae by a combined fleet of Cumae and its ally Hieron I, tyrant of Syracuse.

In 421, Samnite hill-tribes known as Oscans that had been moving into Campania captured Cumae. The city retained some Greek population but from now on was predominantly Oscan. Cumae had been friendly with Rome until the Oscan conquest but now was ranged with Rome's Samnite enemies. Roman expansion into Campania broke the Oscans' links with the

Samnite hill tribes and in 338 Cumae became part of Rome's federation.

Cunaxa, Battle of (401)

The battle of Cunaxa (probably modern Tell-al-Kenisa, approximately 28 miles [60 kilometers] north of Babylon) was fought in late summer 401, between the armies of Artaxerxes, king of Persia, and his younger brother Cyrus.

Cyrus, advancing from the north, placed some 12,900 Greek mercenaries on his right, and took up the center position next to the Greeks with his personal regiment of 600 cavalry. His 100,000 Asiatic infantry, 20 scythed chariots, and the rest of his 3,000 cavalry were on his left.

On the day, Artaxerxes had 6,000 cavalry and 150 scythed chariots. Reports of the size of his infantry vary, reflecting the usual Greek difficulty with such large numbers: 900,000 (Xenophon); 400,000 in all (Ctesias, Diodorus Siculus).

Cyrus relied on his Greek infantry to break their opponents. Immediately before the armies engaged, he ordered them to move obliquely to their left, apparently to attack Artaxerxes, who was stationed in the center of an army that far outnumbered his enemy and was thus outside the Greek direct line of attack.

Cyrus' order was not carried out. The Greek charge cleared away the troops opposite them and in their advance they lost contact with Cyrus. Cyrus himself made a brave but ill-judged attempt to strike at Artaxerxes with his 600 cavalry. He wounded him before being cut down. At his death, his Asiatic army gave up. Artaxerxes' right wing attacked Cyrus' encampment in the rear of his army but were beaten off from the Greek section by the guard stationed there. The Greeks who had pursued their defeated opponents for some 3 miles (4.8 kilometers) returned to find

themselves isolated.

The battle of Cunaxa again demonstrated the superiority of Greek hoplites against Persian infantry. This, and the success of Greek mercenaries in fighting their way home (their epic journey is recorded in Xenophon's *Anabasis*) led to renewed Greek military activity against the Persians, beginning with Agesilaus II of Sparta and culminating in Alexander the Great's conquest of the Persian Empire.

Curtius Rufus (First or Second Century CE, or Later)

Curtius Rufus, author of a history, in Latin, of Alexander the Great is often identified with the self-made man who became consul in Rome in 43 CE (Tacitus, *Annals* 11.21), but there is no certainty over his identity or date. His *History of Alexander* is in 10 books. The first two are lost; Book 3 begins in 333. There are also a number of gaps in the text, including a long one in Book 10, so that the account of events from the mutiny at Opis to just before Alexander's death is missing. The personal name "Quintus" (to make him Quintus Curtius Rufus) is attested only in later manuscripts of the work.

The work is strident in tone, much given to moralizing judgments and attribution of personal motives. There are numerous speeches in the work, probably mostly composed out of the author's head.

The work is believed to derive to a large extent from the sensationalizing "Vulgate" or popular tradition about Alexander that was associated with the (near contemporary?) historian Cleitarchus. Curtius Rufus gives only the scantest indication of sources known to him (e.g., on Cleitarchus: 9.5.21, 8.15). Despite the issues, useful material can be extracted from his often surprisingly detailed account.

Cynoscephalae, Battle of (364)

Cynoscephalae, a ridge line in the territory of Scotussa in Thessaly named after its dog heads' shape, dominated the neighboring plain and Pharsalus-Larissa road. On July 13, 364 (dated by an eclipse of the sun) the Theban general Pelopidas led 7,000 men from Thebes to join perhaps 10,000 Thessalians resisting Alexander of Pherae's attempt to dominate the region. Alexander's force of Thessalians and mercenaries was perhaps as much as 20,000 strong. Alexander got to the heights at Cynoscephalae first but Pelopidas' cavalry scattered the enemy horse onto the plain. When his infantry was unable to progress uphill against the enemy's missiles, Pelopidas pushed to the front and led the men on. His presence inspired them, and Alexander's troops began to fall back. With the arrival of Pelopidas' cavalry to assist, the enemy were pushed off the crest. At this point Pelopidas, who had a personal grudge against Alexander, charged him. Although causing casualties among his guard and getting tantalizingly close to Alexander, Pelopidas was cut down. Alexander's troops were routed by a final cavalry charge, losing around 3,000 men. Another Theban victory soon afterward crushed Alexander's ambitions and forced him to give up all the territory he had gained and restrict his activities to Pherae. This second victory suggests that Cynoscephalae was not decisive. The loss of Pelopidas, a driving force in Thebes' military success, was a heavy price to pay and the first step in its subsequent decline.

Cynoscephalae, Battle of (197)

The battle of Cynoscephalae in Thessaly ended the Second Macedonian War, sealed Rome's political dominance over Greece, and signaled the beginning of the end for the kingdom of Macedon. It is also significant for demonstrating the vulnerability of the ponderous *sarissa* phalanx (see second illustration in Phalanx entry) to maneuverable close-combat heavy infantry such as the Roman legion. This was proven again at Pydna (168), which completed the Roman destruction of Macedon and saw the Roman legion replace the phalanx as the preeminent infantry force.

Philip V of Macedon faced the Roman commander Titus Quinctius Flamininus. After various skirmishes the two sides headed north to find favorable ground for a decisive engagement. After a few days marching, the two armies camped on either side of a range of hills, neither knowing about the presence of the other. The next morning dense fog covered everything, significantly reducing visibility. Reconnaissance forces sent by both Philip and Flamininus to occupy the heights clashed, with the Romans initially coming off worse. As Philip's vanguard gained the upper hand, Roman reinforcements arrived and began to force the Macedonians back. This prompted Philip to send most of his cavalry and mercenaries in force to win the skirmish at the ridge. Both armies were deployed and headed to the top of the hill for a full engagement. Flamininus positioned his right wing at the foot of the hills fronted by elephants while he led the left wing up to the summit. Philip with half the phalanx and his peltasts reached the top first and, after doubling the phalanx's depth, met the Roman infantry head on and quickly routed them, the hill and the length of the *sarissae* preventing the Roman infantry from closing to be able to use their swords. At this setback Flamininus moved to command his right wing, leading it up the hill to attack Philip's left wing. These Macedonian forces had only just reached the summit and were still in disorder watching the battle to their right

rather than preparing to fight. The phalanx did not have time to form up properly and so was quickly defeated, the soldiers fleeing down the hill in panic.

At this point, both sides had won on their respective right wing but the Romans were the first to turn to face the victorious enemy. A Roman tribune, apparently acting without orders, took 20 maniples from the right and attacked the remaining half of the Macedonian phalanx in the rear. Unable to change face quickly on account of the length of their *sarissae*, the Macedonian phalangites raised or dropped their weapons to show surrender. The Romans did not understand this signal and hacked their way into the middle of the dense formation of men. Philip and the remnants of his right wing then joined the flight of the rest of the army, having suffered great losses to the phalanx.

Cyprus

Cyprus is a large island situated in the eastern Mediterranean, just off the coast of Cilicia (modern Turkey), and close by the Levant. Although occupied from around 9000, it was during the Early Bronze Age that significant immigration from Asia Minor led to the widespread settlement

of the island, with numerous centers and cities developing. The Bronze Age was a time of prosperity for the island, with its rich copper mines giving the island its current name. It was also an important site for trade with the Near East, with many trade-oriented settlements developing along its southern and eastern coasts. The island also visited, traded with, and was well known to, Bronze Age Egypt. Archaeological remains indicate trade with Syria, Egypt, Phoenicia, Crete, and the Greek world.

Settled by Phoenicians in the ninth century, the island remained distinctly Greek in character, with 8 of the 10 kings of the island bearing Greek names in the seventh century when the island fell under the political influence of the Assyrians (outright conquest is not clear from the sources). By the sixth century, the influence of the Assyrians had waned, and was replaced by the Egyptians under Amasis. In ca. 525, the island was conquered by the Persians under Cambyses, and was combined with Syria and Palestine to form the fifth satrapy of the Persian (Achaemenid) Empire. Despite this, the island's monarchies seem to have survived, retaining a degree of autonomy and prosperity within the Persian satrapal system.

All of the Cyprian kingdoms—with the notable exception of Amathus—joined with the Greeks and rebelled against Persia during the Ionian Revolt. The rebellion was swiftly and decisively crushed by a vengeful Persia. However, the rebellion had a long-lasting impact on the social fabric of the island, reinforcing the Hellenism of its inhabitants and leaders. After the Persian Wars, Cyprus was briefly freed by Cimon; much of the fifth century was spent with Athens and Persia fighting for control over the island. In 411/10, Evagoras the king of Salamis swept the Persians from the island and promoted Greek culture, language, and art over Phoenician influences. This Hellenism did not survive Evagoras, who was defeated in 380 and then assassinated in 374 in a court intrigue. The struggle for independence from Persia lasted until Alexander the Great's victory at the battle of Issus in 333. The Cypriot fleet assisted Alexander in his siege of Tyre. In 295–294, the island became part of Ptolemaic Egypt under Ptolemy I Soter, before being annexed by the Romans in 58. Caesar restored Cyprus to Egypt between 46 and 44, but it passed back under Roman control when Egypt was annexed in 30.

Cypselus (d. ca. 625)

Cypselus, tyrant of Corinth, was father of Periander. Herodotus' account of him follows the story pattern of the endangered child who is saved, but is in the context of a speech denouncing tyranny. Cypselus' tyranny and that of his son are given as examples of the terrorizing acts committed by tyrants.

Cypselus was born to Eetion and Labda, a daughter of the Bacchiadae, the ruling class. Labda was disabled and so (unusually) was married outside the Bacchiadae. Two separate oracles suggested, first to Eetion and then to the Bacchiadae, that Cypselus would rule Corinth. The Bacchiadae sent men to kill Cypselus, but these were overcome by pity for the baby initially and failed to kill him. Labda overheard their intent as they remonstrated with each other and changed their minds, and hid Cypselus in a container (variously called a grain jar or a beehive, a *kypselē*, from which his name is taken) until the men left. This story is very similar to that of Cyrus (Herodotus), but without the positive connotations associated with Cyrus. Both Cyrus and Cypselus are put into containers, as dead infants were traditionally prepared for burial in ancient Greece.

Cypselus survived due his mother's initiative and later became the tyrant of Corinth, encouraged to do so by another oracle. He is reputed to have executed large numbers of citizens, exiled many others, and confiscated their property. He is said to have ruled for 30 years.

A variant on the tradition reported by Nicholas of Damascus, possibly drawn from the historian Ephorus, is far more positive and suggests that Cypselus became a popular leader in Corinth. He killed the last Bacchiad ruler and proceeded to exile his enemies, recalling those sent into exile by the Bacchiadae. He is said to have ruled as a benevolent king with the favor

and support of the Corinthian populace, to such a degree that he required no bodyguard.

Cyreans. See Ten Thousand, March of the (401–400)

Cyrene

A city in North Africa (modern Libya) situated in a fertile region of the Mediterranean coast known as Cyrenaica. It was separated from Egypt to the east and Tunisia to the west by vast deserts, which focused much of Cyrene’s trade and contact north toward Crete and Greece, rather than to other parts of Africa.

Cyrene was allegedly founded in 630 by colonists from Thera (on modern Santorini), led by Battus. Though the detailed foundation myth related by Herodotus is probably legendary, a fourth century inscription shows that the Cyrenaeans continued to believe the city was settled by Therans escaping food shortages at home.

The royal dynasty, the Battiads, ruled Cyrene independently until submitting to Cambyses in 525. In 413, during the Second Peloponnesian War, Cyrene supplied two triremes and pilots to Spartan forces. Later, having submitted to Alexander the Great, Cyrene was conquered by Ptolemy I Soter’s general Ophellas, and a pro-Egyptian oligarchy installed. After minor revolts in 312–309 and 306, Ptolemy I installed his son Magas as governor, and the city remained part of the Ptolemaic kingdom until interference by the Roman Senate in 163.

Cyrus II (Reigned 559–530)

Starting as king of Anshan (in Fars), Cyrus created an empire stretching from Central Asia to the Aegean in under 25 years. A four-year war (553–550) against Astyages of Media gave him western Iran. In 547, he crossed the Tigris on his way to Lydia (a traditional suggestion, denied by some collators of the crucial cuneiform text and reaffirmed by others) or perhaps Armenia. Lydia was certainly conquered by the late 540s, exposing the Aegean seaboard to Persian annexation. Then in 539, Cyrus crossed the Tigris, defeated Nabonidus' forces near Opis and entered Babylon within 15 days. While Nabonidus was unpopular with some Babylonians, their effective contribution to the outcome is unknown and many others certainly fell at Opis resisting the conqueror. Cyrus eventually died in central Asia extending a frontier whose establishment involved conflicts in eastern Iran and beyond (545–540, 538–530). The scale and rapidity of his achievement is startling.

Recent scholarship stresses an Elamite component in the birth of Persian imperialism. Cyrus' name was Elamite, Anshan had been an appanage of Elamite kings and the Elamite-language bureaucracy of Persepolis demonstrates Elam's legacy. But what empowered Cyrus surely came from Fars, not Susa; and it was in Fars that he created a royal city at Pasargadae, whose architecture and iconography were not primarily Elamite. What won power was military conquest; innovation in recruitment, tactics, and weaponry may be the key, but relevant direct evidence is lacking. Cyrus' reputation has benefited from the Hebrew Bible, though his authorization of

the reconstruction of the Temple is a fiction. It is also wrong to call his edict to Babylon (the “Cyrus Cylinder”) a Charter of Human Rights. The document was particular and not universal and was driven by political expediency and autocratic benevolence, not the application of general principles about human worth.

Cyrus the Younger (ca. 423–401)

One of Darius II’s four sons, and the first born after his father became king. His mother’s suggestion that (like Xerxes) he should therefore be his successor was rejected, but she did save him when Tissaphernes accused him of plotting to assassinate the new king, Artaxerxes II. His royal ambitions were undiminished by this episode and, reinstated in the Anatolian satrapies he had held since 407, he planned a military challenge. The experience and personal connections gained from funding Spartan fleets in 407–405 helped him assemble the largest Greek mercenary army yet seen in the Aegean world and, with this and Anatolia-based non-Greek forces, he marched east (401).

Belatedly warned of the danger by Tissaphernes (who had been fighting Cyrus for control of Miletus), Artaxerxes confronted him six months later at Cunaxa in northern Babylonia. Cyrus’ mercenaries easily defeated their

opponents, but the battle's outcome was settled by a cavalry encounter in which Cyrus wounded Artaxerxes but died in the ensuing *melée*.

Since Ctesias' *Persica* is known only in fragments, our fullest source for these events is Xenophon's *Anabasis*, Book 1 of which conveys a distinctive picture of Cyrus through detailed narrative and a laudatory obituary chapter. A model product of court education, Cyrus displayed physical courage, had mastered the technical skills of a Persian aristocrat (horsemanship and use of weaponry) and knew how to exercise leadership by keeping his word, punishing wrongdoing (the spectacle of mutilated criminals allegedly kept Anatolian roads safe for travelers), and, above all, taking pleasure in rewarding loyalty and success generously.

His politic empathy with subordinates even supposedly extended to suggesting that it would have been better to have been born a free Greek than a powerful Persian. In short: "all who can claim to have known him agree that no Persian since the Elder Cyrus was more like a king or more deserving of the throne" and "I have heard of nobody whom I judge to have been loved by more Greeks or barbarians" (Xenophon, *Anabasis* 1.9.1, 28).

Cyrus' fratricidal ambition, overconfidence immediately before Cunaxa (Artaxerxes' appearance caught him unawares), and fatal impetuosity during it perhaps undercut Xenophon's praise. But his successful cooperation with the equally ambitious Lysander and ability to mount a credible military challenge to Artaxerxes suggest that he had remarkable qualities. Nor should we forget that he was at most 22 years of age when he died.

Cyzicus, Battle of (410). See Hellespont Campaign (411–410)

D

Darius I (Reigned 522–486)

A relief from the Persian capital, Persepolis, showing a Persian king receiving officials. The image is often identified as Darius I, though in fact it may not be intended to represent any particular king or it may represent Xerxes. The king's feet do not touch the ground, an important attribute according to Plutarch. (Roger Wood/Corbis)

Darius became king by assassinating a man who had usurped the throne from Cambyses. This man purported to be Cambyses' brother Bardiya, but Darius asserted (perhaps untruthfully) that he was an impostor. In any event, with Darius the kingship passed from the family of Cyrus to a new (Achaemenid) dynasty. His coup provoked resistance from supporters of the previous dynasty and empire-wide turmoil. It took 19 battles and the elimination of 9 pretenders to restore order: so Darius claimed in a victory monument at Behistun which began the assertion of a distinctive ideology in which imperial power ultimately flowed from the god Ahuramazda and was characterized by peaceful coexistence between king and subjects. There were other innovations, for example, systematization of tribute-collection (the king's way of taking a clear profit from local taxation) and the development of Persepolis and Susa as the principal heartland capitals, and there was also imperial expansion.

During 521–512, Darius defeated central Asiatic Scythians, annexed part of the Indus valley, asserted suzerainty in Macedonia and eastern Thrace, and crossed the Danube—where, however, a nomadic enemy proved recalcitrant. Over a decade later westward expansion resumed, leading (after the Ionian Revolt) to the temporary setback of Marathon. Study of Darius' world has been transformed lately by systematic work on Babylonian archives (illuminating the burden on a rich imperial province) and the Persepolis Fortification texts (illuminating the political economy, religious landscape, and complex bureaucracy of the Persian heartland).

Darius II (Reigned 423–404)

On Artaxerxes I's death, three brothers claimed the throne, Xerxes, Sogdianus (who murdered Xerxes in his bed), and Darius, who mounted a successful military challenge to Sogdianus. Subsequent revolts by another brother (Arsites) and satraps Tissuthnes (Lydia) and Terituchmes (uncertain location) failed, as did a later Median insurrection. Other notable events involved Egypt (native unrest; authorization of Passover celebration at Elephantine; destruction of the Jewish temple there) and the Greek frontier. Serious Persian involvement in the Second Peloponnesian War began in 412 and, with effective cooperation between Lysander and Cyrus, assured Sparta's victory.

Darius III (Reigned 336/5–330)

Before becoming king, Artasatiš, the future Darius III, was satrap of

Armenia (his reward from Artaxerxes III for killing a Cadusian in single combat) and royal *astandes* (“messenger,” but perhaps in overall charge of communications). The claim that his grandfather was Artaxerxes II’s brother may be an official fiction, since such a grandfather should have been killed during Artaxerxes III’s brutal elimination of rivals at the time of his own accession. Like Artaxerxes IV (338–336), he was made king by Bagoas but, unlike him, was ruthless enough to survive the experience. Insurrections in Egypt and (perhaps) Babylonia were evidently suppressed, and, faced with Alexander’s arrival in Anatolia, Darius initially assumed he would be contained by local forces.

Their catastrophic defeat at Granicus (334) and Alexander’s willingness to march inland despite continuing Persian resistance at Halicarnassus and in the Aegean called for a change of approach. The death of Memnon, the Greek general to whom Darius (remarkably, if not unprecedentedly) entrusted Granicus’ western front after Granicus was also a factor. The strategy for Alexander’s definitive defeat now lay in the mobilization of two large royal armies, led into battle by Darius himself at Issus (southern Cilicia) in 333 and Gaugamela (northern Mesopotamia) in 331—and on both occasions roundly defeated. Each time Darius fled (see illustration in Alexander, Invasion of Persian Empire entry), which was prudent (in the interests of further resistance) but invited accusations of cowardice, not helped by claims that Darius sought to negotiate a division of the empire with Alexander before or after Issus.

After Gaugamela, Darius moved first to Media and then toward Bactria. What he expected to achieve is uncertain because he was murdered by the Bactrian satrap Bessus, who proclaimed himself king (Artaxerxes V) and then also fell victim to treachery. The difficulty Alexander experienced in pacifying Bactria-Sogdiana hardly guarantees that, had Darius retained his authority, he could have used the region to launch a successful counter attack. Nor is it certain that that loss of authority proves he was a hopeless leader from the outset. Alexander honored Darius once he was safely dead, and uplifting stories were told about Darius’ gratitude for Alexander’s proper treatment of his captured womenfolk. But these may be as suspect as the stories about abortive negotiations or reports that some Greek mercenaries were his most loyal supporters to the end or that there was a death-bed conversation with Alexander.

Gaugamela and Bessus appear fleetingly in Babylonian texts and either

Gaugamela or Issus is referenced in the Egyptian Somtutefnahkt *stele*, but knowledge of Darius is almost entirely dependent on the Greco-Roman sources that record his empire's demise. Some think this makes recovery of the historical Darius peculiarly difficult, but at least, unlike the Iranian tradition represented by Firdausi, Greeks never claimed Alexander and Darius were half-brothers.

Dead, Treatment of

In wars between Greeks, the general practice was to recover one's own dead and not to mistreat the corpses of the enemy. This was not always observed, however, and it was not unknown during civil conflict for corpses to be mistreated or at least not accorded the normal burial rites.

Although the niceties were perhaps not regarded as applying to *barbaroi*, or non-Greek speakers (although Pausanias at Plataea in 479 is a counter example), in warfare between Greeks the dead were supposed to be respected. One's own dead were respectfully recovered and either laid to rest at the site or, if close enough, returned home for burial. An extreme example of this (although admittedly involving royalty and therefore

unusual) was the transport of King Agesilaus' corpse home to Sparta from Asia Minor, covered in wax to preserve it. In 425, after the battle of Solygeia, Nicias sacrificed his claim to the victory by requesting a truce to reclaim two Athenian corpses which had been missed when the Athenians had removed their dead from the battlefield. If the corpses were returned home, in some cases, for example at Athens, a public ceremony could be held for their burial and they were commemorated on monuments or inscriptions.

The enemy dead, on the other hand, were regularly stripped of their arms and armor and then returned under a truce. For this reason, fierce combat could occur to prevent the enemy gaining possession of the body of a leader or other notable, or even a friend (see first illustration in Hoplites entry). As noted above, asking for a truce for the return of the dead was a formal admission of defeat, because it acknowledged that the side requesting it did not control the battlefield. It was rare for the dead not to be returned, although the aftermath of the battle of Delium (424) provides a well-known example where return of the dead was used as a bargaining tool.

The most famous literary example of mistreatment of a corpse (albeit a foreigner) is of Hector. After Achilles had stripped him of his armor (which he had previously stripped from Achilles' friend Patroclus) the Greeks who came to look at the corpse stabbed it with their spears. Achilles then cut a slit between Hector's ankles and tendons, threaded thongs through them and hitched the corpse to the back of his chariot, so that he could drag it around the city of Troy in front of the horrified gaze of Hector's relatives, wife, and fellow citizens. However, Hector was a foreigner, Achilles was known for his savagery, was distraught with grief at Patroclus' death, and it represents a very early period of Greek warfare. Another well-known literary example is from Sophocles' *Antigone*. Here, Creon of Thebes decreed that the corpse of Polyneices, a prince of Thebes who had led a foreign army against his own city to press his claim to rule, should be left out in the open to rot or be eaten by birds and animals.

Although they must have occurred, incidents such as these in the Classical Period are rare in the historical record. The corpses of Nicias and Demosthenes, who were executed as prisoners of war in Syracuse in 413, however, were supposedly left in the open to decay.

Civil conflict, which could bring out particularly high emotions, could

also result in the mistreatment of the dead. This generally involved leaving them to rot in the open, or throwing the corpses into the sea or beyond the boundaries of the state. In some cases, the bodies of the dead which had already been buried were dug up and cast beyond the borders of the state. This treatment was accorded to robbers, pirates, suicides, temple-robbers, and the like but also to traitors and those on the losing side in civil conflict.

In 317, Cassander supposedly ordered that the corpse of Olympias remain unburied; the same fate had been accorded to Phocion at Athens the year before (although the decree was circumvented). This punishment was not only a humiliation but, as the Greeks believed that the spirit from an unburied body could not rest, it was punishment beyond the grave.

Decelea

A deme (Athenian local administrative area) northeast of Athens. Decelea had a strategic position on the eastern pass over Mount Parnes on one of the main routes between Athens and Boeotia. Its main claim to fame is in the Second Peloponnesian War (431–404), the second half of which is often called the “Decelean War.” The land route through Decelea was important for access to stock evacuated to Euboea and was a quicker final leg for grain imported via Euboea. Without this, imports had to go the longer way around Cape Sunium and were often subject to significant delay from the famous contrary winds.

In 413, on Alcibiades' advice, the Spartans occupied Decelea, blocking Athenian communications with Euboea, while allowing the occupying force to ravage Attica all year round. This prevented access to winter crops or grazing, interfered with the silver mining at Laurium, and encouraged desertion by Athenian slaves. These adverse effects were a factor in Athens' surrender in 404.

Declaration of War

There is nothing in Greek history corresponding to the elaborate ritual of Fetial Law long used by the Roman Republic to declare war. There is no example of heralds (*kerykes*) issuing a declaration of war to another state. Herald, who were sacrosanct, commonly carried messages between belligerent states or hostile armies but this role took place when war had already begun. In essence, a Greek war was underway when one side decided to attack another. The war had plainly begun when that side crossed the frontier of the other under arms.

Thucydides' account of events in 431 makes this plain. Late in 432, the Spartans and their allies had decided to go to war with Athens unless it met their demands. A series of ambassadors was sent to Athens but was met with refusals and counter-demands. "Open" war began only after a Theban force made a surprise attack by night (early 431) on Plataea, an Athenian ally. From this point on, Athens and Sparta communicated only through heralds (Thucydides 1.146, 2.1). As these states were now at war, sacrosanct heralds were needed to ensure that ambassadors could pass from one state to another. The Spartans and their allies assembled their army at the Isthmus of Corinth (431). While the army was still there, King Archidamus

II of Sparta sent an envoy (and presumably a herald, not mentioned by Thucydides) for one last try to extract concessions from Athens. The Athenians, however, had voted not to accept any herald or ambassador once the Spartan army had crossed its own frontier (Thucydides 2.12). Archidamus' crossing of the Athenian frontier carried the process of beginning war to its conclusion.

Thus, the outbreak of a Greek war was formally marked not by any verbal declaration but by a hostile act against another state. A variant on this process, involving not territory but shipping, can be seen in 340/39 when Philip II of Macedon, up to this point in a treaty of peace and alliance with Athens, attacked Athenian triremes and freighters in the Sea of Marmara. The Athenians then voted to "overturn the *stèle*" (the inscribed plinth) recording the treaty with Philip, a sign that a state of war now existed between them (Demosthenes 18 [*On the Crown*] 72).

Dedications, Military

Dedications to the gods to thank them for success in a venture, or returning safely from a trip or from war could be made by both individuals and states. They were sometimes placed in a sanctuary in fulfillment of a vow to the gods made before an event, essentially in a bargain with the gods—a gift in return for success. Military dedications were therefore part of a widespread Greek practice.

Although dedications of individual spoils occurred, it became a very common, though probably not universal, practice to dedicate a tenth of war booty to the gods, at some sanctuary or other. Pausanias quotes an inscription from Olympia, describing a golden shield dedicated by Sparta after the battle of Tanagra in 457 as "the tithe (*dekate*) on account of victory in war." (Parts of this inscription have actually been found on fragments of the marble support.) The best evidence comes from the great sanctuaries,

such as Olympia and Delphi, which have been archaeologically thoroughly explored and where we have detailed written descriptions in authors such as Pausanias, but many sanctuaries in the Greek world must have benefited from this habit. The great sanctuaries became immensely rich storehouses of treasure and art. Indeed, W. K. Pritchett has commented that, "Without wars, few of the temples and other sacred buildings of Greece would have been built" (Pritchett, *Ancient Greek Military Practices*, p. 100).

Such dedications had two purposes: to thank the gods for the favor shown, in the hope of enjoying more success in the future; and as a form of public display, enlarging oneself and belittling one's enemies. Plutarch has a character in a dialog complain about all the dedications in sanctuaries with inscriptions such as, "Brasidas and the Acanthians from the Athenians," "the Athenians from the Corinthians," "the Phocians from the Thessalians," and so on (Plutarch, *Moralia* 401C-D, Loeb trans.). By Plutarch's time, these all referred to victories hundreds of years in the past: boasting in a sanctuary enjoyed considerable longevity.

At the most basic, weapons and armor taken from the enemy dead would be dedicated, but much more elaborate dedications were possible. At the sanctuary of Poseidon at Sunium, the Athenians dedicated a whole Phoenician ship captured at Salamis in 480. Often, however, dedications were paid for from the money raised by selling spoils. The golden shield referred to above is one example, as are the golden shields attached to the temple at Delphi by the Athenians. Lucius Mummius, after the Achaean War and the destruction of Corinth in 146, dedicated 20 gilded shields which Pausanias saw attached to the temple at Olympia, above the columns. Statues, especially bronzes, were also often dedicated.

Buildings in sanctuaries might be paid for out of the spoils of war. A number of treasuries at Delphi fell into this category: a treasury was a small building, built by one state, which could be used among other things to house valuable offerings. But the treasury itself was also an offering to Apollo. According to Pausanias, the Athenian treasury (which, reerected, can be seen today) was paid for out of booty taken from the Persians at Marathon, the Syracusan out of booty from the Athenians in 413, and the Theban from spoils taken from the Spartans at Leuctra in 371. The Potidaeans, Pausanias commented, had actually built their treasury out of piety. The Athenians had built a stoa from spoils taken in the Second Peloponnesian War, perhaps (Pausanias speculates) from Phormio's naval

victories in the Corinthian Gulf. In addition, the Athenians dedicated bronze shields and figure-heads from ships. At Olympia, perhaps the most favored site for military dedications, Pausanias tells us that the temple of Zeus itself, as well as the image of the god, were paid for out of the spoils taken by the Eleans from the Pisans.

Other sorts of offerings might also be made. They might simply be in the form of money—like the 100 talents of gold which Agesilaus is said to have dedicated at Delphi after successfully campaigning in Asia Minor. It is possible that people sometimes gave the sanctuary slaves captured in war, though most of the evidence for this is from stories set in the mythical past. Finally, land also could be given to a god. After capturing Mytilene in 427, the Athenian divided much of Lesbos into 3,000 allotments, which were given to Athenian citizens but rented back to the farmers of Mytilene; but 300 allotments were kept back and dedicated to the gods, whose sanctuaries would then enjoy the rent paid by the Mytileneans as a source of income.

The piety behind dedications was no doubt often genuine, but they often—perhaps usually—also represented a form of competitive display, sometimes indeed competing directly with each other. The first major statue group a visitor saw on entering the sanctuary at Delphi was in the Stoa of Lysander, built to commemorate the Spartan victory at Aegospotami in 405. This contained an impressive set of statues on two levels, including a number of gods, Lysander himself being crowned by Poseidon, and even the captain of Lysander's ship. The stoa and its statues were no doubt intended to overshadow a much more modest Athenian display right next to it, a set of statues (of Athena, Apollo, and Miltiades) paid for out the spoils of Marathon. But after defeating the Spartans at Leuctra in 371, the Boeotians built the largest treasury in the sanctuary in a position well chosen to dominate and compete with Lysander's stoa. Thus, dedications from the spoils of war became a form of competitive politics and publicity seeking.

Deilia (Cowardice). See Discipline, Military

Dekate

Dekate, literally “one-tenth,” referred to the share of spoils that it was conventional to dedicate to a god, such as the tenth of the spoils dedicated to Apollo at Delphi from the spoils taken from Decelea in the last phase of the Peloponnesian War (Xenophon, *Hellenica* 3.5.5).

It was also customary to dedicate to a god one-tenth of the property of condemned traitors, since all of this was seized as part of the punishment (e.g., Xenophon, *Hellenica* 1.7.10, 20). Connected with this sense is a special application of the term *dekate* and its related verb *dekateuein* (“to exact a tenth from”) to enemies in an especially bitter conflict. In this case, the dedication of a tenth of the spoils was to be accompanied by the complete seizure of the persons of the enemy (for enslavement or massacre) and of all their land and other property.

Such a declaration amounted to a war of total extermination. In 480, the Greeks allied against the Persian invasion swore an oath that they would “exact a tenth from” any Greeks that sided with the Persians without compulsion (Herodotus 7.132). In the event, this extreme measure was not carried out: the Aleuadae of Thessaly for one bribed their way out. Thebes also escaped, but animosity lingered. In 371, when Thebes alone rejected a Common Peace, “There was now some expectation of the proverbial exacting of a tenth from Thebes” (Xenophon, *Hellenica* 6.3.20, 6.5.35). The expression had become common (cf. Polybius 9.39.5), even if such tithing never happened.

Delian League/Athenian Empire

The naval-based alliance negotiated by Athens in 478/7 after victory in the Second Persian War that became the foundation of the Athenian Empire. It was known in antiquity as “the Athenians and their allies”; the term “Delian League” (or “Delian Confederacy”) is a modern one. Its establishment marked the start of a major shift in the balance of power in Greece away from Sparta and toward Athens.

Athens replaced Sparta in command of the campaign against Persia in the Hellespont region in 479/8. This was at the request of many of the Greek states involved who resented the arrogance of the Spartan commander, the regent, Pausanias. The Delian league was established the following year.

Member states swore an oath of loyalty and agreed to provide either warships and men or a monetary contribution. Aristides (nicknamed “the Just”) was asked to assess the member contributions. The early membership included most of the Aegean islands, cities in the Hellespont, and some in Asia Minor. Each member had an equal vote in the assembly, enabling Athens to influence the vote of the smaller states.

From early on, Athens encouraged monetary contributions and this was used to expand and fund the Athenian navy. Most allies were happy to do so, but it eventually led to the situation where the League forces were predominantly Athenian and the members lost the capacity for individual action.

Thucydides records conflicting statements of the purpose of the League. At 1.96, he states it was to ravage Persian territory to recover losses from the damage done to Greeks during the recent war. At 3.10, he records a Mytilenean statement that it was established to “free the Hellenes (Greeks) from Persia.”

The League was very successful in its early campaigns, freeing many cities from Persian control and destroying Persian naval power in the Aegean at Eurymedon River (ca. 467/6). Although the League had already

developed some less than democratic tendencies, from Eurymedon it became increasingly dominated by Athens. Actions included forcing states to join (Euboea, ca. 472) or preventing them from leaving (Naxos, 468/7; Thasos ca. 465).

Defeated revolting members were forced to contribute money instead of warships and lost foreign policy autonomy. Other methods of ensuring Athenian control were to send out a garrison, and/or political officers and to try serious offences (murder, treason) in Athens. A particularly unpopular method was to settle Athenians of military age as cleruchs (military settlers) on confiscated land.

At its peak the Delian League had about 200 members, and formed an effective counterweight to Sparta's Peloponnesian League. Membership brought considerable advantages—in the early days, freedom and continued independence from Persian rule. The League navy suppressed piracy and protected against Persian resurgence. It used a common currency and weights and measures (both Athenian). All of these encouraged stability and commerce.

However, from the 450s, the level of Athenian control meant that the League had essentially become the Athenian Empire. There was increasing resentment toward the Athenians, both from members and from other Greeks worried at Athens' rise in power and wealth. Athens' increasingly intrusive control measures were highly unpopular. By 431, only Lesbos and Chios were still contributing ships and men rather than paying tribute. The treasury was now located in Athens (moved from Delos after a serious League defeat in Egypt, in 454), and the Athenians essentially regarded it as their money. Tribute became the basis of Athenian state pay for political, jury, and military service and Pericles used it to help build the Parthenon.

Many allies took the first available opportunity to revolt during the Peloponnesian War of 431–404 (although some remained loyal throughout) and the League was dissolved when Athens lost.

Delium, Battle of (424)

A major land battle fought in 424 during the Second Peloponnesian War (431–404), in the area of Tanagra (Boeotia) between the Athenians and Boeotians. The action was part of an attempt, initiated by the Athenians Demosthenes and Cleon, to neutralize Boeotia, a key Spartan ally, and the threat to Athens’ north. The engagement was part of an elaborate Athenian plan: the general Hippocrates was to fortify the temple of Apollo at Delium, while Demosthenes, with an army raised locally in Acarnania to the west, would move on Siphiae, which was to be betrayed to him, while the Orchomenians would hand over Chaeronea. The resulting unrest in Boeotia, it was planned, would ensure that the Boeotians would not interfere with Hippocrates’ operation at Delium.

The coordination failed because of a mix up in dates and the betrayal of the plot at Siphiae. As a result, Hippocrates, leading 7,000 hoplites, a large proportion of the 1,000-strong cavalry corps and some *psiloi* (light troops), ended up at Delium without the anticipated distraction. Although Hippocrates fortified Delium, one of the Theban Boeotarchs, Pagondas, leading a Boeotian force of 7,000 hoplites, 10,000 *psiloi*, 500 peltasts, and 1,000 cavalry arrived while he was still at the temple and his army a short distance from it.

Hippocrates deployed his cavalry on the wings with 300 at the temple as a guard but with orders to intervene if the opportunity arose. The Thebans deployed with their cavalry and *psiloi* on the wings and left a force to block any sortie from the temple. Of note, the Theban contingent was 25 deep, with the other Boeotian contingents in a variety of depths—the traditional disposition (which Hippocrates adopted) was eight deep. The hoplite

engagement was fairly even—while the Athenians defeated the enemy left wing, the deeper Theban phalanx on the right pushed the Athenians slowly back. The turning point was when Pagondas sent two contingents of cavalry to aid his left—when they crested the hill the Athenian right wing mistook them for the advance guard of another army and fled, leading to the collapse of the entire army. The Boeotians were unable to make full use of their cavalry and *psiloi* to inflict casualties on the fleeing enemy because nightfall interrupted. Notably, Alcibiades, serving with the Athenian horse, helped Socrates, serving as a hoplite, steadfastly withdraw from the battle. The Athenians still held the temple and the Boeotians, contrary to usual practice, refused to return the Athenian dead until the garrison withdrew, arguing that their duty to return the dead was overridden by Athenian sacrilege in occupying and fortifying the temple. The debate was ongoing when the Boeotians ended it by taking the temple (using an ingenious flame-throwing device) and returning the bodies from both the battle and the garrison.

Delos

Delos, a small Cycladic island, became an important religious and panhellenic center, particularly for the Ionian states. In myth, it was the birthplace of the twin Olympian gods, Apollo and Artemis. A sacred festival was celebrated there from the Archaic Period. Even the Persian admiral, Datis, respected the sacred nature of the island and left its treasury intact in

490. In 478, it was the symbolic core of the Ionian naval alliance.

An Ionian amphictyony existed to protect its independence, but in fact Delos had been dominated by Naxos from the seventh to early sixth centuries, Paros in the mid-sixth century, Samos briefly after the Parians—during which time, Polycrates interfered in religious matters by consecrating neighboring Rheneia—and then by Athens from the late sixth. In the sixth century, the Athenian tyrant Peisistratus, out of favor with Delphi, spectacularly “purified” Delos as a means of demonstrating Athenian intentions to set up the island as an alternative religious focus. In the fifth century, the island was the center of the Delian League, until the Athenians transferred the League treasury to Athens. During the Second Peloponnesian War, the Athenians again cleansed Delos, by emptying all the graves across the entire island, and a few years later by expelling living Delians as well.

In the Hellenistic Period, Egypt and Macedon jostled for influence in the area, but when the island supported the losing Macedonians against Rome, it was returned to Athenian control in 166. After this it flourished not just as a cult center but also as a trading port and slave market, until in 88 it was sacked by Mithridates’ general, Archelaus, and then by pirates 19 years later. Within a century, the decline was complete and the island was all but deserted.

regional alliance, the Delphic Amphictyony, tried to protect the oracle's independence. Herodotus says that in 480 the sanctuary was saved miraculously from the Persians by thunderbolts, falling rocks, and the intervention of giant spirits, Phylakes and Autoñoüs. The Gauls had more luck in 279, looting its treasures, as did Sulla and Nero. The Emperor Julian sponsored a short-lived revival before Delphi was closed and its festivals quashed by the Christian, Theodosius.

It was critical, especially for hegemonic states, to have a good relationship with Delphi. For example, Athens was out of favor with Delphi and Olympia throughout much of the Peloponnesian War of 431-404. Thucydides says that the Delphic oracle publicly expressed its support for the Peloponnesians and, on one occasion, even proffered the unsolicited assurance that Apollo himself would assist Sparta.

The importance of Delphi is shown by the fact that four "sacred wars" were fought over it (though the first, in the early sixth century, is probably legendary). The Third and Fourth Sacred Wars, in the mid-fourth century, saw Philip II of Macedon increase his influence in southern Greece. After the time of Philip and Alexander, Delphi—while remaining a rich and well-visited sanctuary—declined in political importance.

Delphic Amphictyony

The Delphic Amphictyony was a religious league of uncertain antiquity, which controlled the great panhellenic sanctuary of Apollo at Delphi. The Amphictyony was composed of 12-member *ethne*, or tribes (sing. *ethnos*). The original *ethne* were the Thessalians, Perrhaebians, Magnesians, Achaeans of Phthiotis, Ionians (including both Euboea and Athens), Dorians (including those from Doris in central Greece, and a number of cities in the Peloponnese, including Sparta), Boeotians, Phocians, Locrians, Malians, Aenianians, and Dolopians. Thus, although Delphi was visited from all over the Greek world, it was controlled by a limited subset of states, all from mainland Greece. The original center of the Amphictyony was probably the sanctuary of Artemis at Anthela, near Thermopylae. How it later came to control Delphi is not known.

Over time the membership could change: in 346, at the end of the Third Sacred War, Philip of Macedon was given membership in place of the defeated Phocians. However, Macedonian representatives at Delphi were not referred to as “Macedonian,” but as “from Philip,” later “from Alexander.” At some point, in 346 or earlier, the Perrhaebians and Dolopians were combined into an artificial single *ethnos*, and the Delphians became an *ethnos* in their own right.

When the Amphictyony’s workings first become visible to us in the fourth century, we find voting on the Amphictyonic Council in the hands of 24 *hieromnemes*, two from each *ethnos*. There were also subsidiary members of the Council, *pylagoroi*; their number is not known. The Amphictyony’s main role was to manage the sanctuaries under its control. We first hear of it in the sixth century, when it managed the rebuilding of the temple of Apollo after the previous one had burnt down; a similar process happened in the fourth century. A series of Sacred Wars were fought over Delphi; the First is probably a fiction, the Second very small. But in the Third Sacred War (356–346), the Amphictyony was the rallying point for states opposing the Phocian occupation of Delphi. Forces from member states played a role at the start of the Fourth Sacred War (340–338), though they soon handed the problem over to Philip II of Macedon. The Amphictyony never had armed forces of its own. Yet the prestige of Delphi meant that control of the Amphictyony could have political advantage: in the fourth century the Spartans, Jason of Pherae, the Thebans, and Philip

successively attempted to exploit this.

The Amphictyony continued to exist through the Hellenistic Period and into Roman times, and membership again changed several times. In particular, the neighboring Aetolians, never previously members, became the dominant power at Delphi in the early third century, maintaining that position until defeated by the Romans in 189.

Demaratus (Reigned ca. 515–491)

A Eurypontid king of Sparta. He opposed his Agiad fellow king, Cleomenes I over the invasion of Attica (506), and again about 491 when Cleomenes tried to arrest Persian sympathizers on Aegina at Athens’ request. Demaratus fled to Persia after Cleomenes had him deposed on a false charge of illegitimacy. Accompanying Xerxes to Greece in 480, Demaratus is portrayed in Herodotus as providing high-quality advice, which Xerxes ignored. Demaratus was granted estates in Asia Minor, in Pergamum and other nearby towns, and died there.

Demetrias

Demetrias was a large city in southeast Thessaly, very close to the site of the modern city of Volos. Demetrius I Poliorcetes founded the city around 290 by bringing together much of the nearby Magnesian population. Impressive fortifications and trading privileges encouraged an influx of population, and the city became a major fleet base for Macedonian rulers. Demetrias was one of Philip V of Macedon's three "fettters of Greece," central to his control of all of Greece. After defeating Philip in the Second Macedonian War, Titus Quinctius Flamininus first garrisoned but then withdrew from Demetrias. The city supported Antiochus in the Syrian-Roman War and was the point where Antiochus first landed in Greece. Returned to Macedonian control after the war, Demetrias remained an important regional center, and was head of a later Magnesian League.

Demetrius I of Bactria (Reigned ca. 200–180)

Demetrius I was a Hellenistic king in Bactria and parts of northwest ancient India (modern Pakistan), ca. 200–180. He was the son and heir of Euthydemus I, and he gained a reputation for leadership and conquest while his father was still on the throne. When Euthydemus was besieged by the Seleucid king Antiochus III in about 206, Demetrius was sent to assist in the negotiations. Antiochus found the prince's bearing and speech praiseworthy, and because of this, he promised Demetrius a daughter in marriage and permitted Euthydemus to retain his independent kingship. Also while his father was still ruling, Demetrius conquered parts of India. On a stone

inscription from Kuliab, Demetrius is described as *Kallinikos* (“the glorious victor”) and son of the great king Euthydemus. Demetrius was most likely a coruler with his father when he first began minting his own coins. From the beginning, and throughout his reign, he portrayed himself on coins wearing an elephant scalp. This is symbolic of his conquest of India. It also emulates coins of Ptolemy I Soter, which depict Alexander the Great wearing an elephant scalp. The evidence of Demetrius’ coins reveals a powerful king at the head of a complex bureaucratic government. His administration ensured accuracy and standardization in his coinage. Further, patterns of his mint production show that Demetrius initiated several short-term auxiliary mints, which demonstrates that he was militarily active throughout his reign. At his peak, Demetrius controlled Bactria, the Paropamisadae, and Arachosia. The Hellenistic city at Ai Khanoum was likely one of his strongholds. Besides coins, a coin-striking die for Demetrius was reportedly found at Ai Khanoum. Demetrius’ conquests paved the way for several dozen subsequent Indo-Greek kings to rule in northwest ancient India. One later king commemorated Demetrius on a coin series and referred to him as *Anikitos*—the “Unconquered One.”

Demetrius I Poliorcetes (ca. 336–283)

Known as “Poliorcetes” or “the Besieger,” Demetrius was the son of Antigonos I Monophthalmus. Of all the Successors of Alexander the Great, he most resembled him in talent, looks, and charisma. He was raised in Phrygia, and given his first independent command in 314, when he was left to defend Syria. He was defeated in the battle of Gaza in 312, but was

responsible for a number of successful campaigns against the generals of Ptolemy I Soter and Seleucus I Nicator, in 311–310. By 307, Demetrius and his father were being hailed as savior gods by the Athenians after their liberation of the city, and cults were established for them. Eventually, Demetrius was effectively deified by the Athenians (see, for example, the hymn quoted in Athenaeus 7.253D). Demetrius distinguished himself particularly by his naval victory against Ptolemy at Salamis in 306, which was later commemorated on examples of his coinage. Shortly afterward, he and his father at last crowned themselves kings, making them the first of Alexander's Successors to claim the title. It set a precedent for the other *diadochoi* to quickly follow suit. Another career highlight was Demetrius' year-long siege of Rhodes. His incredible innovations there in this form of warfare and in siege engines earned him his nickname of "Besieger"—a somewhat ironical name as the siege of Rhodes was at great cost but he was ultimately unable to take it.

Silver coin of Demetrius I Poliorcetes, minted in Macedonia ca. 289, shortly before he was deposed. Demetrius is depicted here in the traditional royal diadem, and the coin is designed to give the impression of youthful vigor and power, although he was 46 or 47 when it was minted. Located in the Yale University Art Gallery, New Haven, Connecticut. (Yale University Art Gallery)

He was also well known for debauchery and scandalous, excessive behavior, particularly in Athens where he was said to have inflicted a great number of indecencies on the Parthenon. He was polygamous, like many of the early Hellenistic kings, marrying at least five times and keeping many mistresses, including the notorious Lamia. A coalition of the other *diadochoi* defeated Demetrius at the battle of Ipsus in 301, where Antigonus lost his life and Demetrius was forced to flee. Despite this reversal of fortune, Demetrius retained his huge fleet and title and effectively ran his kingdom from the sea for a number of years as he campaigned to regain his

territories. He spent time in 299 attacking Thrace at Lysimachus' expense, and the two were to become lifelong enemies. In 296, he was able to take back Athens, and then campaigned against Sparta. The death of Cassander in Macedon and the subsequent succession crisis then allowed Demetrius the opportunity to seize the Macedonian throne.

He was, however, poorly received as king, and by 288 he was expelled by another coalition, headed by Lysimachus and Pyrrhus. Demetrius once again set about rebuilding his empire, and left for Asia with his force, but being in poor health and facing numerous desertions from his supporters, he was soon forced to surrender to Seleucus (285). He was from then on detained in honorable captivity, and appears to have refused to cooperate with his son Antigonus II Gonatas' attempts to liberate him. Demetrius died within three years of his captivity, his poor health no doubt accelerated by the excessive drinking and depression of his final years.

Demetrius II Nicator (ca. 160–125)

Demetrius II ruled the Seleucid Empire in two separate reigns, ca. 145–138, and 129–125. Aged about 15, he led a mercenary army to drive out the usurper Alexander I Balas. He then showed further military capacity by reasserting Seleucid control over Judaea-Palestine and defeating a usurper Diodotus, who had taken the regal name of King Tryphon.

In 139, Demetrius II launched an ambitious offensive to regain territories in Mesopotamia lost to the Parthians. He won victories but was taken prisoner, allegedly falling into a trap under a deceitful peace treaty. In his

absence the kingdom passed into the hands of his younger brother, Antiochus VII Sidetes.

When Antiochus VII attacked Parthia (129), Demetrius was released to create the diversion of a civil war in the Seleucid Empire. With the death of Antiochus VII in Parthia, Demetrius reestablished himself as king and ruled to 125, when he attacked Egypt and was killed and defeated near Tyre by Egyptian forces supporting a pretender, Alexander II Zabinas.

Demetrius II's early successes gained him the title "Nicator" ("the Conqueror"). He showed great gifts for leadership at the head of his troops in the tradition of Alexander the Great, but was too harsh to be popular and in his second rule he suffered from the discredit of his captivity in Parthia.

Demetrius of Phalerum (ca. 350–280)

Demetrius of Phalerum (also Demetrius Phalereus or Demetrius of Phaleron) was an Athenian philosopher, orator, and conservative, pro-Macedonian statesman aligned with Phocion. A student of Theophrastus, he began his public career as an orator ca. 325 during the "Harpalus affair." A solid body of fragments survives from his speeches, moral philosophy, popular stories and fables, history, literary criticism, government, and letters.

When Phocion died (318) Cassander installed Demetrius as governor of Athens. Demetrius reformed Athenian political procedures and law along conservative lines, including laws to curb ostentatious spending on funerals (ironically he had a reputation for excessive personal expenditure).

However, there is no detailed evidence for the widespread legislation ascribed to him in antiquity and modern reconstructions of them may go too far.

When, Demetrius I Poliorcetes occupied Athens in 307, Demetrius fled. His unpopularity saw the destruction of 299 of his 300 statues and his other honors were revoked. In Egypt, Demetrius impressed Ptolemy I Soter, became his librarian, and is also supposed to have helped revise Egyptian law. However, when Ptolemy II Philadelphus became sole ruler (283), he exiled Demetrius, who died soon after.

Demetrius of Pharos (Active ca. 230–215)

Demetrius of Pharos was an Illyrian general. During the First Illyrian War (229–228), Demetrius captured Corcyra before falling out with his queen, Teuta, and surrendering Corcyra and Pharos to the Romans. Demetrius advised Rome for the remainder of the war, which ended in a treaty in 228. Demetrius was made a friend of the Roman people and given Pharos. Succeeding Teuta, Demetrius reestablished relations with Macedon and at Sellasia in 222 led Illyrian forces in the Macedonian victory.

Demetrius' expansionist agenda soon brought him back into conflict with Rome. In direct contravention of the 228 treaty, Demetrius sailed past the Lissus River and engaged in piracy, triggering the Second Illyrian War in 219.

The Romans attacked Pharos, luring the Illyrian forces from their

fortress into a trap. Demetrius abandoned Pharos and fled to Macedonia, ending the war. Allied with the Macedonians, Demetrius died later fighting in their service.

Democracy and War

For a long time, ancient historians believed that the emergence of democracy in ancient Greece was caused by a rising military participation-rate. In doing so, they accepted the testimony of Aristotle that the sudden appearance of phalanx-based battles in the mid-seventh century compelled the elites of *poleis* (city-states) to involve in their wars prosperous non-elite citizens (e.g., Aristotle *Politics* 1297b16–28). These new hoplites, he claimed, quickly demanded more popular forms of government in recognition of their contributions in battle. Also widely accepted was the proposition of Aristotle and other philosophers that the consolidation of democracy in Classical Athens was a consequence of the demands of subhoplite citizens for greater political rights (e.g., 1274a11–14; 1304a22–4). They supposedly could make such demands, because the creation of a huge Athenian fleet had made their military service possible.

In recent years, the belief that such military changes caused democratization has been seriously called into question. Aristotle wrote in the later fourth century and so his reliability as evidence for the Archaic Period is far from certain. In particular, his statements about the so-called hoplite revolution are contradictory and inaccurate. Mass fighting is clearly present in the eighth-century poems of Homer. This strongly suggests that the hoplite phalanx resulted, not from a sudden revolution, but from slow changes in tactics and weapons. In addition, Archaic Period hoplites came predominantly from the elite and waged wars infrequently. That this small-

scale warfare impacted significantly on political institutions is highly unlikely. In the same vein, the association of democracy and sea power has been shown to be a purely ideological construction. This association was invented for partisan political purposes by Pseudo-Xenophon ("Old Oligarch"), Plato and other philosophical critics of Athenian democracy. There is simply no evidence that non-elite Athenians ever believed their legal and political equality were a result of their ability to contribute militarily to the state.

In ancient Greece, sea power may not have been a direct cause of democratization. But in Classical Athens it did still impact indirectly on the consolidation of its democracy. The two decades of fighting after the Persian Wars changed significantly the economy and the society of Athens, in turn causing political changes. With imperial income the Athenians built the massive port facilities and hired the thousands of workmen that were required to maintain their warships. The needs and the salaries of these shipbuilders encouraged the development of secondary businesses. The bringing in of ever-larger amounts of cargo to service this military-led expansion quickly made the Piraeus the Mediterranean's busiest trading port. In turn, new urban jobs attracted large numbers of non-elite Athenians from the countryside. By moving to the city they found it much easier to attend the city-based meetings of Athenian democracy. The sheer number of campaigns and the complex task of running the Delian League increased significantly the volume of public business. Consequently, assembly- and council-meetings had to be held more regularly. Coming on top of the socioeconomic changes, this intensification of politics developed the institutions of Athenian democracy. It also gave the *demos* (people) the confidence and the general knowledge which they needed to take further control of the state and its magistrates.

Athenian democracy's impact on war, by contrast, was direct and two-sided. On one side its common dynamic of non-elite audiences and elite performers competing with each other led to a pronounced pro-war culture. This encouraged the *demos* to become hoplites or sailors in ever-larger numbers and to initiate wars very frequently. On the other side, Athenian democracy's public debating of war and peace normally reduced the foreign-policy risks of this cultural militarism. This debating too facilitated military innovations and helped to develop the battlefield initiative of Athenian combatants.

Non-elite Athenians understandably had a positive view of their own military service as heavily armed soldiers and sailors. Consequently, they preferred those politicians and playwrights who employed Homer's positive depiction of soldiering, which had been the preserve of the upper class before the democracy, to describe their own military service. Because non-elite Athenians continued to be ashamed of their poverty (e.g., Aristophanes, *Wealth* 218–221; Lysias 24 [*On the Refusal of a Pension to the Invalid*] 16–17), this extension of the traditional conception of *arête* down the social scale made soldiering attractive to them as a source of esteem. But this recognition of courage among non-elite soldiers proved to be a double-edged sword. While making them feel proud, it put them under social pressure to participate in, and to vote for, wars. For the Greeks, *arête* had to be regularly proven by actions, while those who saw themselves as courageous felt *aischyne* (shame) if accused of cowardice. Athenians could be so accused not only if they retreated from a battle but also if they failed to endorse a war that appeared to be necessary (e.g., Euripides, *Children of Heracles* 700–701, *Suppliant Women* 314–323). The result was that politicians exploited the fear of shame among assembly-goers to build support for their bellicose proposals, even if it risked pressuring them into wars which they could not possibly win.

Certainly the democracy's open debating of foreign policy did not affect the bellicosity of the *demos*. But it did normally reduce the risk that they would endorse poorly conceived proposals for war. Politicians were free to be contentious, and their rivalries with each other guaranteed that calls for war met with opposing arguments and alternative proposals (e.g., Thucydides 1.139; 3.36–50). The constant adjudicating of such debates by non-elite Athenians improved the quality of their decision-making on foreign affairs and made them more innovative and flexible than the combatants of oligarchies and autocracies. It allowed them to see the merits of military innovations that confounded the traditional conception of courage.

Demography, Military

Population affects war-making, and war-making affects population. The number and types of military personnel available to a society are dictated by population size (how many men can fight), age-structure (how many are of appropriate age to serve), and incapacity. War deaths affect population by lowering it, but also by reducing the parental investment available to children. War affects population when extended campaigns separate husbands and wives, reducing reproductive encounters. Migration, another demographic phenomenon, also affects a society's ability to make war: in terms of immigration, resident aliens (metics) can serve in war; emigration of citizens reduces a society's ability to field soldiers. Finally, culture affects reproduction and demography (how many sons are desirable? Is remarriage frequent? What percent of a population is permitted to fight as a hoplite citizen-soldier or as a light-armed skirmisher?), and thus affects how many military forces can be fielded, as we see when comparing different states, such as Athens, Macedonia, Thessaly, and, most dramatically, Sparta.

Military service in Archaic and Classical Period Greek city-states was normally restricted to citizen males possessing sufficient wealth to arm themselves. Thus, a state's military power was closely related to its citizen population size, which was structured by its natural resources, territorial size and carrying capacity, economic development, and percentage of total population enfranchised. In Classical Athens, members of the lowest wealth class (the thetes) primarily served as rowers for warships since they were insufficiently wealthy to afford arms. Other Greek city-states such as Corinth, Argos, and Thebes had particularly large land armies. Typically, Archaic and Classical Greek cities are thought to have fielded approximately two-thirds of their available citizen males of military age in serious military conflicts (this assumes males 20-onward; the quantity of males over 60 was probably demographically insignificant), and troop numbers recorded in ancient literary texts have given historians ideas of

how many adult male citizens lived in particular Greek city-states. (The problem of the circularity of cross-referencing city-size by military call-up is somewhat solved by checking against territory size.)

Sparta presents a peculiar example of the relation between demography and military activity. Citizen-soldier Spartiates enjoyed privileges of income and devotion to military training, but the Spartiate population's steady decline, caused by economic and cultural factors, coupled with a deep aversion to allowing non-Spartiates into the Spartiate caste, caused Sparta's armies to contain fewer and fewer Spartiates compared to *Perioikoi*, Helots, and other marginal populations, who lacked the intensive, lifelong military training enjoyed by Spartiates. This lack surely contributed to Sparta's military losses in the fourth century, such as at Leuctra (371), Mantinea (362), and Megalopolis (331).

The fourth century witnessed the beginning of an uncoupling of a city-state's citizen population and the number of soldiers that could be fielded. The practice of hiring mercenaries and the growth of political entities larger than cities, such as federations and Hellenistic kingdoms, resulted in vastly larger armies being fielded from this point onward.

Demosthenes (General) (d. 413)

Demosthenes, son of Alcisthenes, was an Athenian general during the Peloponnesian War of 431–404. The main feature of Demosthenes' generalship is his innovation—at both the tactical and strategic levels. At the tactical level, he was responsible for every known Athenian ambush and night attack during the Peloponnesian War. This, and his use of light troops were very much outside the norm of the hoplite-dominated land warfare. At the strategic level, Demosthenes also tried to break away from the default

patterns of both hoplite warfare and Athens' largely defensive strategy.

Demosthenes' first appearance as a *strategos* (general) was in 426, when he attacked the Aetolians to protect Naupactus, a key ally on the Corinthian Gulf, and provide a launch point for future attacks against Boeotia from the west. However, Demosthenes' hoplites, unable to close with their javelin-equipped and more mobile Aetolian opponents, were eventually worn down and routed. Fearing a hostile reception at home after this defeat, Demosthenes remained in Naupactus. The relative impotence of hoplites against light-armed troops was a lesson Demosthenes never forgot and he used it to good effect in future engagements—the first being his decisive victories at Olpae in the winter of 426/5.

In 425, Demosthenes was responsible for fortifying Pylos, a headland on the east of the Peloponnese, to use as a base for raiding Spartan territory and creating unrest among the Helots. This was very effective, causing the Spartans to abandon their annual invasion of Attica to deal with the situation. Their attempt to recapture Pylos failed and a contingent of Spartan hoplites was trapped on the nearby island of Sphacteria. Working with Cleon, Demosthenes planned and executed a skilled assault on the island, using light troops and tactics in the same way used against him in Aetolia. The Spartan surrender was a major psychological blow and the Pylos garrison caused significant damage through raiding and encouraging Helots to desert.

In 424, Demosthenes failed to capture Megara, although he did take its port, Nisaea. Again partnered with Cleon, Demosthenes took a leading part in the attack on Boeotia that ended in failure at Delium (424). Whether Demosthenes or Cleon was the main influence in this attack is uncertain, but the operations against Megara and Boeotia seem to be part of a consistent policy of protecting Athens from land attacks.

In 413, Demosthenes was dispatched to Sicily. On arrival he took vigorous action to revitalize the siege of Syracuse, but suffered a major defeat in a night attack. Demosthenes advised immediate withdrawal but Nicias prevaricated. Demosthenes was captured and executed during the later retreat and destruction of the Athenian forces.

Demosthenes (Orator) (ca. 384–322)

Demosthenes was an Athenian orator and statesman, who played a leading role in Athens' conflict with Philip II of Macedon. From 351, when Demosthenes delivered the first of his speeches against Philip, known collectively as the "*Philippics*," he argued that Athens should adopt more vigorous measures against Philip II of Macedon in the war that had dragged on since 357. In 348, he pressed for stronger efforts to help Olynthus against Philip. When Philip induced Athens to begin peace negotiations in 346, Demosthenes served as one of the Athenian ambassadors. He later claimed to have come to mistrust his colleagues, Philocrates and Aeschines. Demosthenes also claimed after the event that this pair had frustrated his warnings on Philip's untrustworthiness.

Demosthenes worked to undermine the peace treaty with Philip. In 343, he brought a prosecution, commonly referred to as the "False Embassy Trial," against Aeschines for high treason in the negotiations of 346. Aeschines was narrowly acquitted. In the *Third Philippic* (341) and later speeches, Demosthenes claimed that Philip was in effect at war with Athens. When Philip moved to open war in 340/39 and unexpectedly appeared with his army at Elatea in Phocis, Demosthenes made the crucial proposal for an alliance with Boeotia. After the defeat of Chaeronea (338), he no longer took a leading role in politics.

In 331, Aeschines prosecuted an associate of Demosthenes to discredit Demosthenes' anti-Macedonian policy. In this "Crown Trial," the verdict was overwhelmingly in Demosthenes' favor. In the mysterious affair over

what happened to the money Alexander's treasurer Harpalus brought to Athens (324–323), Demosthenes was condemned for embezzlement and went into exile. After Alexander the Great's death in 323, he was recalled to Athens during the Lamian War. When the war ended, Demosthenes fled and chose suicide rather than being seized by Macedonian agents.

Speeches from the “False Embassy Trial” (343) and the “Crown Trial” (331) were published by both Demosthenes and Aeschines. These opposing speeches are important historical sources. Other political speeches of Demosthenes provide important but one-sided evidence on Philip II. Demosthenes was a great orator but his policies remain controversial.

Dercylidas (d. after 387)

A Spartiate who in about 398 replaced Thibron and held the command in Sparta's war against Persia in Asia Minor until superseded by Agesilaus II in 395. Nicknamed “Sisyphus” after a mythical figure of outstanding cunning, Dercylidas showed great resourcefulness in making truces with individual satraps, so he could make profitable diversions in and outside

Persian territory. Such stopgaps dealt with the immediate problem of supplying the army but were never going to end the war. His one big offensive against the combined satraps in the Maeander valley led to another inconclusive truce.

In 394, he took command at Abydos and Sestos, resolutely holding these last remaining outposts for Sparta in the region, apparently till the end of the Corinthian War. Unsurprisingly, this enterprising Spartan found life outside Sparta congenial.

Diekplous

The term literally means “sailing through and out” and describes a naval maneuver where ships sailed through an enemy line, turned sharply, and then rammed the enemy ships on the rear or flanks. It was a very difficult maneuver for a whole fleet to execute (although easier for one ship or part of a fleet) and required skilled crews and considerable coordination, which could only have come from training as a fleet. It was successfully used at Lade (494), Chios (201/200), and Side (190).

Diodorus Siculus (ca. 80–30)

Diodorus Siculus wrote a "universal" history, that is, one covering all known peoples from the earliest (mythical) times down to about 60. His *Bibliotheca Historica* (*Historical Library*) consisted of 40 books, of which only 15 survive in full (1–5, 11–20).

Books 1–5 deal with the geography and mythology of different lands. Book 11 begins with the Persian War (480–479); Book 20 deals with Successors to Alexander (317–302). In the later books, events are narrated year-by-year: years are each dated by Athenian archons and Roman consuls.

Diodorus emulated earlier writers of universal history, a genre established by Ephorus and continued on a lesser scale by Polybius and Poseidonius. Diodorus fell far short of the intelligence and industry needed for even a modest level of attainment. When his account can be compared with Herodotus, Thucydides, or Polybius, slipshod work and unintelligent judgment are plain. However, parts of his account of 403–362, corresponding to Xenophon's *Hellenica*, may contain better material because of their derivation from the *Hellenica Oxyrhynchia*. Books 18–20 are better than the rest, perhaps because Diodorus had a tractable source, his usual method being to follow one source at a time.

Diodorus gave considerable attention to the history of the western Greeks. He professed lofty historical principles but was inadequate in practice. Where other sources are not available, historians have to use Diodorus.

Diodotus I and Diodotus II of Bactria (ca. 300–230)

Diodotus I and his son, Diodotus II, were the first rulers of the independent Hellenistic kingdom of Bactria. Their rise to kingship is mentioned in ancient sources and is observable in their coins. Diodotus I was the satrap of the Seleucid province of Bactria during the reign of Antiochus II Theos (261–246). Around 250, Diodotus began a gradual revolt through his coinage rather than outright military action. Initially, Diodotus issued a series of satrapal coins that bore the name of Antiochus, but a portrait of Diodotus. The reverses of the coins also contained new imagery. He replaced Antiochus’ device, Apollo seated on the *omphalos*, with a new design of Zeus wielding a thunderbolt. Diodotus also made his son, Diodotus II, his coruler, a Seleucid practice that would also become common among the Greco-Bactrians. They both continued to issue coins with Diodotid imagery until regional unrest provided an opportunity to openly secede. In the same decade, Arsaces, leader of a nomadic tribe, invaded the Seleucid province of Parthia.

After Antiochus II died in 246, the new king Seleucus II Callinicus (246–225) was occupied with fighting Arsaces. Diodotus I, meanwhile, successfully used his army to defend Bactria from Arsaces. When Diodotus I died, Diodotus II made peace with Arsaces and declared himself king of Bactria. He was not hindered by the Seleucids. He issued a new series of coinage that displayed his name and title, “King Diodotus,” along with his portrait and device. Later Greco-Bactrian kings, seeking to honor their predecessors, issued several commemorative coins that reproduced the coinage of Diodotus I and II, among others. On these commemorative coins,

Diodotus I carries the epithet “Soter” (“Savior”), perhaps for protecting Bactria from Arsaces. Diodotus II was also commemorated with the epithet “Theos” (“God”). Diodotus II lost the Bactrian throne ca. 230 to a usurper, Euthydemus I.

Dion of Syracuse (ca. 409–354)

Born around 409, Dion was a politician and supporter of his brother-in-law, the tyrant Dionysius I of Syracuse. Dion was heavily influenced by the philosopher Plato, and when the latter visited Syracuse in 388 the two men became close friends. In 366, Dion persuaded Dionysius I's successor, Dionysius II, to invite Plato to Syracuse again. Dion hoped that he and Plato could influence Dionysius II to become a Platonic “philosopher king.” Unfortunately, Dion was instead suspected of conspiracy and forced into exile.

In 357, he returned to Sicily with a small military force of 1,500 mercenaries and support from Carthage. Mobilizing popular support at Syracuse, he drove Dionysius II from power. Dion was elected *strategos autokrator* (general with supreme powers) and effectively ruled in Syracuse, until losing the support of the masses due to his opposition to democracy, his unpopular social and economic reforms, and his reliance on foreign mercenaries. He was exiled to Leontini, but in 355 was recalled and allegedly had his main political opponent murdered.

Following the suicide of his own son, as a result of a plot by his friend, the Athenian Callippus, Dion was suspected of wanting to recall his relative Apollocrates, the son of Dionysius II, and to nominate him as his successor. As a result, Dion was assassinated in 354.

Dionysius of Halicarnassus. See Roman Section: *Dionysius of Halicarnassus*

Dionysius I of Syracuse (ca. 432–367)

Dionysius I, also known as Dionysius the Elder, was the son-in-law of Hermocrates of Syracuse. Dionysius rose to power during the war in Sicily between the Greeks and Carthaginians that had raged since 409. His motion in the Syracusan assembly in 406 led to the dismissal of the city's generals and the appointment of new ones, including Dionysius himself. The following year he was elected *strategos autokrator* (general with supreme powers) and surrounded himself with bodyguards. With the war against Carthage going badly and civil disturbances within Syracuse he concluded a peace treaty primarily to allow him breathing space, to gather his strength, and to make preparations to resume the war when he was better prepared. He recruited mercenaries, fortified Ortygia Island, turning it into a citadel from which he could rule Syracuse, and extended the city wall to encompass the Epipolae Plateau and the construction of the Euryalus Fortress at its western edge. At the same time, engineers working for Dionysius I invented the catapult. He also embarked on a policy of extending his control over much of the eastern coast of Sicily.

From ca. 397 to 392, Dionysius I was at war with Carthage. The first struggle, 397–396, ended in a notable victory and confined Carthage to northwest Sicily. A second conflict ended in 392 with a treaty advantageous to Dionysius.

In 391, his first attempted invasion of Italy was a disaster, in the aftermath of which, he formed an alliance with the Lucanians. With the aid

of his Lucanian allies he undertook a second invasion of Italy in 389, devastating the territories of Thurii, Croton, and Locri, and in 386, he besieged Rhegium, captured the city, and sold the population into slavery. During the siege of Rhegium, Dionysius received a near fatal wound to the groin. Dionysius' brutality toward other Greeks made him unpopular in the Greek world and his embassy to the Olympic Festival of 388 was looted and pillaged by a crowd; the actors he had employed to recite his self-composed verses were despised once the crowd realized who they represented. Despite his unpopularity with other Greeks, Dionysius' victory at Rhegium nevertheless made him the chief power in Magna Graecia. Dionysius then attempted to extend his control into the Adriatic, sending colonists to found cities, and conducting a campaign in Epirus.

Dionysius embarked on a third war with Carthage (383–379) which ended in complete disaster at the battle of Cronium in 379. Dionysius suffered a crushing defeat and his brother, Leptines, was killed during the rout. The Carthaginians refused to take prisoners, and allegedly some 14,000 of Dionysius' troops lost their lives during the battle and the ensuing rout. The resulting peace treaty settled the frontier on the River Halycus. In 368, he was again at war with Carthage, but it was to be his last; he died while besieging Lilybaeum in 367.

Dionysius II of Syracuse (Reigned 367–357 and 346–344)

Dionysius II of Syracuse, also known as Dionysius the Younger, was the son of Dionysius I of Syracuse and Doris of Locri. At the death of his father, the younger Dionysius ruled at Syracuse from 367 to 357. His first act as ruler was to end his father's war with Carthage with the diplomatic help of his uncle, Dion of Syracuse. Dionysius II lacked the military drive of his father and following the successful removal of any potential rivals adopted a life of indolence and pleasure-seeking.

Dion invited the philosopher Plato to Syracuse to help influence Dionysius to be a "Philosopher King," but Dionysius II became suspicious and banished both his uncle and Plato. While Dionysius was away from Syracuse and preoccupied in refounding cities in southern Italy, his uncle returned and usurped the rule of Syracuse. However, Dionysius retained his control of Locri in Italy and ruled there as tyrant.

Dionysius II was to return and rule Syracuse from 346 to 344, some eight years after his uncle's death. He remained unpopular both with the Syracusans and the Sicilian cities he had formerly controlled and was soon penned up in his fortress citadel, and surrendering to Timoleon in 344 he lived in exile at Corinth until his death.

Diplomacy

Diplomacy is a useful term to apply to the ways in which Greek states conducted their relationships, so long as it is kept clear of any connotations of modern diplomacy with its international treaties and conventions and trained professionals residing as ambassadors in embassies that are sovereign entities on foreign soil. Greek practice was in general personal and informal.

The formal and ceremonial side of dealings between Greek states was carried on by heralds (*kerykes*), who were sacrosanct and regarded as serving the gods. Heraldry conveyed messages between states, including military matters, such as declarations of war, and religious matters, such as the announcement of the date of a religious festival. A state of hostilities between *poleis* without such a formal declaration of war was said to be a “war without heralds” (*polemos akeryktos*). An important function of heralds was to arrange truces (*spondai*), a short-term agreement for suspending hostilities that was formalized by liquid offerings to the gods. Truces allowed ambassadors to come and go for negotiations, or provided a period of immunity from harm for persons attending religious festivals from states that “accepted the truce.”

Another key role of heralds was on the battlefield where a herald was usually the bearer of a message, from the defeated side to the victorious one, requesting permission to gather up their dead for burial. This request was the formal and explicit acknowledgement of defeat: a victorious side normally had command of the field and so had no need of such a proceeding. Thucydides reports (3.97–99) some prolonged exchanges between Athenian and Boeotian heralds after the Athenian defeat at the battle of Delium (424), in a situation where there were competing claims as to what was proper conduct.

In some states, heralds like clerks and secretaries were salaried employees of the states they represented but heralds were more commonly persons of some standing, appointed for life, as were certain priests. The office of herald was often hereditary in certain families. At Sparta, a hereditary guild of heralds, the Talthybiadae, claimed descent from Talthybius, a herald in Homer’s *Iliad* (Herodotus 7.134). An Athenian decree of 367/6 (Harding 54) directs the *Boule* (Council) to appoint a herald “from all the Athenians” (i.e., a special appointment) to obtain the release of the two hereditary heralds of the Greater Mysteries from the Aetolians “who have accepted the truce.” Their seizure, states the decree, was “contrary to the common laws of the Greeks.”

In contrast to heralds, ambassadors were prominent citizens of their states, elected or appointed to carry out negotiations with a foreign state on specific occasions. No one was an ambassador as a permanent occupation, and only Athens, an advanced democracy, is known to have given pay to its ambassadors. Ambassadors went to other states in time of war under the

protection of a truce; they were not sacrosanct like heralds but by convention enjoyed a protected status. Obviously, interstate negotiations could only happen if all parties respected the go-betweens.

It was customary for ambassadors who were sent to another state to have a history of such dealings, either themselves or in previous generations of their families. Such a relationship could be expected to help ease dealings between the two states. Ambassadors to a foreign state were often chosen from prominent citizens who held the distinction of being *proxenoi* of this state. There is no obvious English equivalent of this term (in the singular: *proxenos*), which is often Anglicized as proxenus. A proxenus was a distinguished person who received from another state the honorary role of offering hospitality to ambassadors from that state. They also had important but not closely defined responsibilities or expectations of facilitating negotiations between their own state and the one for which they acted as proxenus. In 378, three Spartan ambassadors were present in Athens in peacetime when the Spartiate Sphodrias made a bungled surprise attack at night on Piraeus. The ambassadors were found, and arrested, in the home of the proxenus of Sparta (Xenophon, *Hellenica* 5.4.22).

This position of proxy (proxenia) was commonly hereditary, and could be a subject of rivalry like anything in Greek politics. Alcibiades, the brilliant young Athenian politician, was offended in 420 when the Spartans were not using him as their spokesman, even though his own grandfather had renounced the family's hereditary *proxenia* of Sparta long ago. To undermine his rival Nicias, Alcibiades wormed his way into the confidence of Spartan ambassadors at Athens in 421 and in the event deceived them by a piece of sharp practice (Thucydides 5.43–45).

Some ambassadors sent to other states acted simply as mouthpieces and presented a straightforward message that allowed of no flexibility in any discussion. An example is the last embassy that Sparta sent to Athens in late 432 on the eve of the Peloponnesian War. These three ambassadors presented a curt, non-negotiable demand: the Athenians could continue to have peace “if you will grant the Greeks their freedom” (Thucydides 2.139). Spartan ambassadors who had come to Athens shortly before this had indicated that Sparta was ready to make a deal. They demanded that Athens stop the siege of Potidaea and grant Aegina full autonomy, but made it plain that Sparta would settle for Athens rescinding the Megarian decree (Thucydides 1.139).

Ambassadors who were sent, not with clear-cut instructions, but with an open-ended responsibility to negotiate the best terms possible, or with authorization to accept whatever the other side offered, were, in Athenian terminology at least, described as *autokratores*, that is, “with full discretionary powers.” Ambassadors obliged to do their best to make a deal may be seen in the Athenian decree of 378/7 on the establishment of the Second Athenian Confederacy: ambassadors sent to Thebes are to “persuade the Thebans of whatever good they are able” (Harding 35, lines 74–75). In contrast, the 10 Athenian ambassadors sent to Sparta in 404–403 when Athens was under siege in the final stage of the Peloponnesian War were not allowed across the frontier of Sparta until they confirmed that they had been sent *autokratores*: that is, not prohibited from carrying back any demands (Xenophon, *Hellenica* 2.2.19). Previous embassies sent by Athens had been constrained by an Athenian decision not to accept any peace treaty that required demolishing their walls.

Ambassadors who had this kind of discretionary power could not themselves enter into binding agreements. They had to take the terms they had negotiated back to their authorities at home for ratification. It often happened that such ambassadors found that they could not get approval for what they proposed. In Athens, ambassadors whose efforts were rejected could face prosecution, usually in a capital trial, on charges such as treason and bribery. Four Athenians were sent to Sparta in 392/1 to negotiate a peace with Sparta in the Corinthian War. The Athenian assembly rejected the proposed terms and the ambassadors were condemned and exiled. A published speech survives by one of them (unsuccessfully) advocating the peace terms (Andocides 3, *On the Peace*).

Cases of one ambassador are known but the usual Greek practice was to use a larger group. The largest number attested is 10, such as the Athenian embassies of this number sent to Philip II of Macedon in 346. Sharing responsibilities across large groups of officials was a feature of Athenian democratic practice, but even Sparta commonly used embassies consisting of three.

“Negotiation” was used above as a term for the making of agreements between Greek states but it needs to be qualified. The common way for such agreements to be made was by speeches by ambassadors and others to the sovereign body in question. Thus at Sparta in 371, the Spartans and their allies heard speeches by three Athenian ambassadors, each presenting a

different line of argument, before they voted on a treaty (Xenophon, *Hellenica* 6.3.3–18). In 346, Philip listened to addresses by each of the 10 Athenian ambassadors sent to him and then replied to each of them in turn (Aeschines 2 [*On the Embassy*] 21–22, 25–39). In 369, Spartan and other ambassadors as well as Athenian politicians addressed the Athenian assembly when it had to decide on the practical working of a new alliance between Athens and Sparta (Xenophon, *Hellenica* 7.1.1–14). Negotiation then has to be understood in the sense of deliberative bodies making decisions after listening to speeches offering argument, exhortation, and persuasion. This is in effect, reaching an agreement through public harangues followed by a vote.

It was possible for ambassadors to negotiate (or to exchange views) with small groups of officials in private. In 415, the Melian authorities insisted on this course of action, against protests from the Athenian ambassadors, because they were worried that the citizen assembly was likely to yield to Athenian pressure (Thucydides 5.84–85). In 421, after a fruitless round of ambassadorial speeches at Sparta, two Spartan ephors put a proposal in private to ambassadors from Boeotia and Corinth. On their way home, these ambassadors met two prominent citizens of Argos for some more private dealings. However, when the Boeotian leaders put the crucial proposal to the Boeotian federal council, it was rejected because those at the top had not informed the rank-and-file members of the exchange of views and undertakings given in private (Thucydides 5.36–38). This kind of behind-the-scenes discussion went against the engrained Greek preference for speech making before, and decision by, public assemblies.

Discipline, Military

Every ancient army that fought in formations depended on some form of discipline. Greek hoplite armies of the Archaic and Classical Periods were not exempt. If we imagine discipline (*eutaxia*) in militaries measured on a scale, Greek armies of the Archaic and Classical Periods were at the more informal end of the scale. The Macedonian army of the late fourth and third centuries seems to have been more standardized in its discipline, but this too was less formal than what we might expect from the Roman military.

Although it is commonplace to think of military discipline in terms of brutal punishments and regulations, military discipline need not be defined only by formal rules or brutality (or both) or maintained by the same to be effective. It is important to recognize that military discipline, ancient and modern, is more complex than adherence to orders or punishment of infractions. It was and remains a means of control that included mental, physical, and social components that might be reinforced with positive as well as negative sanctions. As noted by Pritchett in his 1974 study, we have no source for Greek discipline equivalent to Polybius for Rome. This has resulted in having to comb our sources for scattered references to it.

Training soldiers to maintain ranks, maneuver collectively, and even remain in battle requires they learn a level of discipline. Military discipline will be acquired through various parts of service including training and learning how the unit works in battle, getting to know one's comrades in arms, and getting accustomed to the society of the army. Discipline could be enforced effectively through willing compliance and morale in combination with expectations and sanctions.

The importance of discipline is not difficult to locate. Hoplite tactics by their very nature depended for much of their success on soldiers remaining in ranks as long as practicable, regardless of whether the ranks were close- or open-order. We find references in Thucydides and Xenophon to the necessity of maintaining discipline and order in battle and on campaign. Thucydides' descriptions of the battles of Delium (424) and Mantinea (418) both make clear that the soldiers on both sides needed to maintain their ranks. Pipes may have helped at Mantinea for example, but these would

have been useless had the soldiers not been sufficiently disciplined to follow them. Xenophon makes the same point in many of his battlefield narratives, especially for Cunaxa (401), and Coronea (394) as well as during the march of the Ten Thousand. In addition to maintaining position in line, it was equally important that they remain orderly while marching and waiting for battle. At Amphipolis (422), Brasidas was able to evaluate the quality of his opposition by their inability to maintain order before battle.

As for the Macedonian army of Philip II and Alexander III, the new tactics would hardly have been effective had the army not been well disciplined. The ability at Chaeronea (338) of the Macedonian phalanx to retreat in order and then turn on their enemy on a command demonstrates how disciplined Philip's army had become. Alexander demonstrated the importance of his army's discipline at every battle, but the best example was probably when he scared off the Taulantians in 335 with a display of precision drill.

Discipline in all ancient armies would have started with the sense of community in the unit and been augmented by training. Since recruitment in most citizen-based hoplite armies was based on local community, peer pressure or social capital would have played the key role internalizing discipline. In semiprofessional (e.g., Sparta) or mercenary armies there would still have been a strong sense of military community within the unit, regardless of the soldiers' origins. This sense of community might have been augmented in these specialized units by competitive spirit or even *esprit de corps*. Familiarity with one's community and a strong sense of shame attached to cowardice and failure would have been important elements in the matrix of discipline. Training also imposed discipline by providing group actions and a layer of control as well as further demonstrating the importance of team-work.

Sanctions further reinforced discipline. Some regular ancient armies (e.g., Rome), had laws to enforce discipline, but few references to laws survive in the historical record from ancient Greece and Macedon. The laws we do learn about suggest the most common disciplinary concerns. Athens and Sparta had laws against desertion (*lipotaxia*), refusal to serve (*astrateia*), and cowardice (*deilia*). One particular form of desertion was the tossing away of one's shield (*rhipspasia*). Given how dangerous it was to those who stood and fought if their comrades fled, it is easy to understand why desertion and cowardice were serious offenses. There were also laws

against officers' abuse of power, including excessive punishment. Such laws were probably common among Greek city-states. Enforcement of these laws seems to have been inconsistent in all periods and it is not known when different cities adopted them. We find references, especially in Xenophon's works, to commanders punishing soldiers who were especially unruly or indisciplined (*ataxia*). Sparta also recognized insubordination by officers. Sparta may have had more formal disciplinary expectations built into its society, but there are few known regulations or laws standardizing military discipline. This lack of formality is not surprising, arising as a function of the citizen-soldier nature of hoplite armies and citizen rights in most city-states.

In addition to shame and the penalties imposed by laws, there was physical punishment like beating. Spartan officers carried sticks to hit those who failed to maintain discipline. Xenophon and Frontinus report examples of physical punishment among mercenary and semiprofessional armies, but as noted already these sanctions seem to have been much less common or inconsistently applied in citizen hoplite armies. There were also positive sanctions to reinforce discipline. Soldiers demonstrating great distinction (including *eutaxia*) might be singled out for special recognition, prizes, or extra booty, any of which conferred increased status within the unit, and which might last after the soldier returned home, as was the case for those who fought and survived Marathon or fought with Brasidas in the Amphipolis campaign.

The other side of the coin is indiscipline (*ataxia*) or military unrest too, of course. Mutiny was the most serious, but is merely one type of "military unrest." Other types of military unrest include military conspiracy, expression of grievances, and insubordination. The most common type of unrest in every military, insubordination, includes disobedience or failure to follow orders, defection, desertion (including cowardice), and dereliction of duty. Dereliction of duty included crimes like falling asleep on duty. The various laws previously mentioned demonstrate that Greeks recognized insubordination (in all its forms) as a problem. While beating was not unheard of, some of these laws carried penalties as severe as death and exile. According to our sources, Iphicrates, Epaminondas, and Alexander the Great each killed men they caught sleeping on sentry duty. According to Plutarch, a Spartan law punished officers who disobeyed orders at Mantinea in 362 with loss of citizenship (*atimia*) and similar penalties attached to

certain cases of cowardice. Pritchett's study includes many more examples of such penalties from many city-states, demonstrating the ubiquity of the problem in Greek armies.

The presence of military unrest does not detract from a commander's or city's reputation. Every army commander, even in hoplite armies, faced the threat of indiscipline—forces where discipline was important and enforced were susceptible to mutinies and other forms of military unrest. Even a brilliant general like Alexander the Great encountered military unrest in his army. After 323, in the Hellenistic world, military unrest would prove to be a significant problem, but in the hoplite armies of Greece there was insubordination, but no incidents that meet the criteria for mutinies.

While it may not have been as obvious to us as in the Roman military, every Greek military commander, even in hoplite armies, relied on some level of discipline for success in warfare. The level and formality of discipline varied widely across the Greek world, reaching its peak in the Macedonian militaries of the late fourth through second centuries. The nature of military discipline in hoplite armies was closely tied to citizen rights and city-state culture so that it reminds us of the importance of understanding Greek culture to appreciate its military history and vice-versa.

Dorieus (ca. 540–505)

Dorieus belonged to the Agiad royal house at Sparta, son of King Anaxandridas by his first wife. Because she had been childless up till then, the ephors compelled Anaxandridas to take a second wife, who gave birth to Cleomenes before Dorieus was born. On the death of Anaxandridas, the succession passed to Cleomenes.

Dorieus resented the humiliation of living as an ordinary Spartiate while his half-brother was king and so took a number of men from Sparta to found a colony on the North African coast, in the region of modern Tripolis. Expelled from there by Libyans and Carthaginians after two years, he returned to Sparta and then organized another expedition to found a colony, named Heraclea, in the vicinity of Mount Eryx in western Sicily. Soon after arriving, Dorieus was killed, along with most of the settlers, in a combined attack by Segesta and the Phoenicians of western Sicily. Herodotus (5.44–45) weighed up the question, without giving a decision, whether Dorieus took part in the destruction of Sybaris in south Italy (in about 511/10). Herodotus was also interested in Dorieus' consulting oracles or, in the case of his first expedition, not consulting the Delphic oracle, in these failed colonizing ventures. He also treated Dorieus as a man of sterling qualities in contrast to his half-brother Cleomenes, a controversial figure.

Doris

Doris was a small region in the upper part of the Cephissus river valley in central Greece, surrounded by mountains on three sides. The Dorians of Doris were generally unfriendly with their neighbors to the east and southeast, the Phocians, but enjoyed better relations with the Locrians to the northeast. Their three main towns, all small, were Boeum, Erineus, and Cytinium. They occupied a strategic position astride the direct route between the Corinthian and Malian Gulfs. In 480, the Persian king Xerxes, having destroyed the defenders of Thermopylae, did not use that pass to enter southern Greece, but rather took his army south into Doris and thence east through Phocis. The other importance of Doris was that the Greeks believed that the ancestors of the Dorians of the Peloponnese, including the Spartans, had settled for a time in Doris during their supposed migration from the north. This sentimental attachment was enough to encourage the Spartans to defend central Greek Doris against the Phocians, while in the fourth century Doris held one of the two Dorian votes in the Delphic Amphictyony. For much of the Hellenistic Period Doris was part of the Aetolian League.

E

Egypt, Egyptians

By the Greek Classical Period, Egypt was home to an already ancient civilization. The Greek historian Herodotus wrote a historical and ethnographic description of Egypt, possibly based on personal observation. Culturally the Greeks were strongly influenced by Egypt, but trade, mainly conducted at designated *entrepôts* within the Nile Delta, was also important.

The 26th dynasty of Egypt, alarmed by the expansion of the Persian Empire under Cyrus the Great, hired Greek mercenaries and expanded the fleet. Nevertheless, in 525 Cambyses II, Cyrus' son, defeated an inexperienced pharaoh and became the first Persian ruler of the 27th dynasty; Egypt was reduced to a satrapy. Egypt frequently revolted against Persian rule, first in 487 when it took two years for Xerxes to quell the revolt. On Xerxes' death in 465, the Egyptians revolted again, in 460 appealing for help from Athens. The Athenians dispatched a significant force of soldiers and 200 ships and had early successes, leaving only the citadel of Memphis in Persian hands. But by 454, the Persians had gained the upper hand and surrounded the Greek forces, who were forced to flee across the Libyan desert with few survivors.

In 404, Egypt again declared its independence, and, despite frequent dynastic struggles and internecine strife, was not reconquered until Artaxerxes III recaptured the province in 343. On his death in 338, Egypt again revolted, but Darius III regained control in 336, only to lose it to Alexander the Great in 332. Alexander left Egypt under local governors. After his death in 323 one of his generals, Ptolemy, swiftly moved to seize control of Egypt and eventually (in 304) established the Ptolemaic dynasty

as Ptolemy I Soter ("Savior").

In the third century, Ptolemaic Egypt exercised considerable power in the Aegean and the Levant, and fought a series of wars with Seleucid Syria. After the end of the Fifth Syrian-Egyptian War in 195, however, the Ptolemies were once and for all pushed back within Egypt itself, while the Sixth (and final) Syrian-Egyptian War, which ended in 168, made it clear that even in the east the dominant power was now Rome. Nevertheless, Egypt remained independent until the last Ptolemaic ruler, Cleopatra, was defeated by Rome and committed suicide in 30. Egypt then became a Roman province.

Elephants

Greco-Roman authors were familiar with two species of elephant, the Asian elephant (*Elephas maximus*) and the smaller African Forest elephant (*Loxodonta cyclotis*). The larger African Bush elephant (*Loxodonta africana*) remained unknown. The limited zoological information about Asian elephants available before the 330s greatly increased as a result of Alexander's invasion of India and later Seleucid diplomatic contacts with the Mauryan Empire, which dominated the Indian subcontinent from ca. 300. African elephants attracted comparatively little scholarly interest.

Elephants first acquired military significance in early Hellenistic warfare. Shortly after his encounter with Porus' elephants on the River

Hydaspes in 326, Alexander organized an elephant-corps, but its military potential was only realized under his Successors. They initially competed to control this formation, but replenishment of adult beasts soon became a crucial consideration, especially given the difficulties and expense of captive breeding. In 305, Seleucus I ceded extensive eastern territories to the Mauryan ruler Chandragupta in return for 500 elephants, which proved decisive in subsequent engagements, notably the battle of Ipsus in 301. From then on Seleucid proximity to India permitted their domination of western access to Indian elephants, although early Antigonid and Ptolemaic armies fielded smaller numbers acquired as gifts or booty. Consequently, by the 270s, Ptolemy II commenced large-scale capture and training of African Forest elephants, despite their inferior size and strength.

A mid-second-century terracotta statuette of a war elephant trampling a Galatian warrior. Elephants entered Greek warfare after Alexander the Great's conquests; this may represent an incident in one of the Galatian wars in Asia Minor against the

Seleucids and Pergamum. The statuette, found on the Greek island of Lemnos, is now in the Louvre Museum, Paris, France. (DEA/G. Dagli Orti/Getty Images)

War-elephants first appeared in the western Mediterranean during Pyrrhus' invasion of Italy and Sicily (280–275). The Carthaginians established their own elephant-corps by 262, which served extensively in the First and Second Punic Wars. In contrast, Roman utilization of war-elephants, chiefly in the second century, was small-scale and infrequent. These beasts were mostly supplied by Numidian allies, whose forces still employed war-elephants in the 40s.

Inheriting the elephant-handling techniques of northwestern India, Alexander's Successors originally manned elephants with only a mahout and sometimes a spear- or *sarissa*-armed rider. The origin and diffusion of the howdah or turret remain obscure, but Hellenistic evidence for this apparatus begins in the 270s. It later became widely employed, either to accommodate a protective crew or as an elevated platform for missile troops, although how (and how often) it was used probably differed according to circumstance and species. On the battlefield the role of elephants, often armored and richly decorated, was primarily psychological. In addition to driving off opposing elephantry, they could disconcert or break up close-order infantry formations and panic horses unaccustomed to their appearance, noise, and smell. They were occasionally used to assault fieldworks and fortifications. Countermeasures included attacks to their eyes and trunk, hamstringing, and obstructions such as pits or spiked obstacles. Elephants were recognized as a potentially two-edged weapon, as wounded beasts might plough uncontrollably through their own ranks, but their prolonged and widespread deployment testifies to their enduring tactical value. Elephants could also assist in particular operational contexts, such as forming a breakwater when armies crossed major waterways. As symbols of military prestige, they participated in ceremonial processions, notably in Ptolemaic Egypt.

Elis

The people of Elis, known as Eleians, were the custodians of the sanctuary of Zeus at Olympia. They may have been allied to the Spartans in an Archaic Period war against Argos. During the Classical and Hellenistic Periods, beginning with their contribution of triremes to the Peloponnesian fleet during the Second Peloponnesian War, they took part in various wars among the Greeks, Macedonians, and Romans.

The Eleians often struggled to maintain possession of the sanctuary of Olympia and the districts south of the Alpheius River. Strabo reports (8.33.3) that when Pheidon of Argos took control of Olympia the Eleians joined the Spartans in defeating him, and then the Spartans helped the Eleians gain possession of all the country north of the Messenian border. According to Pausanias (6.22.2–4), Elis contested control of the games with Pisa during the Archaic Period. Such reports, however, may be based upon later invention. The Eleians are listed on the serpent column from Delphi among the allies who opposed Xerxes' invasion of Greece, but are not reported to have taken part in any particular battle. They later ravaged most of the six "Minyan" *poleis* south of the Alpheius and helped defend Lepreum from certain Arcadians.

During the Second Peloponnesian War and its prelude, the Eleians provided ships for Peloponnesian fleets and expelled an Athenian force from their territory. Following a disagreement with Sparta over Lepreum, however, they joined the anti-Spartan alliance defeated at Mantinea in 418. After their victory over Athens, the Spartans repeatedly invaded Eleia in a conflict known as the Eleian War. Despite the failure of an oligarchic, pro-Spartan coup in Elis, the Spartans compelled the Eleians to make peace. The

terms deprived the Eleians of considerable territory, including what now became Triphylia, and obliged them to provide hoplites for Spartan campaigns, beginning with the Corinthian War.

In 370, the Eleians joined the Thebans, Arcadians, and Argives in invading Laconia and thus recovered some territory lost in the Eleian War. They soon fell out with their allies over Triphylia, however, going to war with the Arcadian League in 365 and helping Sparta against Thebes at the second battle of Mantinea in 362. In 343, following a decade of struggle, the Eleian oligarchs overcame the democrats and turned for support to Philip II of Macedon. After Chaeronea they sent Philip military aid and subsequently participated in the various wars of the Hellenistic Period. In 271, the brief tyranny of Aristotimus was overthrown with Aetolian help. In 245, as allies of the Aetolians and Macedonians, the Eleians recovered Triphylia, but lost it again after the invasions of Philip V in 217. During the wars that followed they at first sided with the Aetolian League but in 191 joined the Achaean League. In 146, Elis regained Triphylia, but as part of the Roman province of Macedonia.

Elis, War with Arcadia (360s)

This war was fought in the 360s, when the Arcadian League repeatedly invaded the territory of Elis, taking possession of Olympia. Although the Eleians failed to regain the sanctuary when they were defeated in a battle

near the temple of Zeus, the Arcadians agreed to return it to them under the terms of peace.

In 365, a group of Arcadian exiles set out from Elis and captured the border town of Lasion, once an Eleian possession but now belonging to the democratically-governed Arcadian League. Arcadian and Athenian forces sent to recover Lasion defeated the elite Eleian companies known as the Three Hundred and the Four Hundred, and went on to take most of the Acroreian towns. Proceeding to Olympia, they fortified the hill of Cronus, captured Marganeis, and advanced to the *agora* of Elis, but were driven back. The Eleian democrats, in league with the Arcadians, seized control of the acropolis, but were ejected by the Three Hundred and the cavalry, and 400 citizens were banished. With Arcadian help, the exiled Eleians took Pylus (inland from Elis), where more democrats from the city joined them.

The Arcadians invaded again, but the Eleians and their Achaean allies drove them from the city and they withdrew from Eleia. When the Achaeans of Pellene returned home to recapture one of their towns from the combined forces of the Arcadians and their own democrats, the Arcadians invaded Eleia for a third time and camped between the city and Cyllene. The Eleians attacked them, but were defeated and returned to Elis. The Spartans now joined the war on the Eleian side, capturing and occupying the Arcadian town of Cromnus. While the Arcadians were engaged in opposing the Spartans at Cromnus, the Eleians in the city defeated and killed the democratic exiles at Pylus and recovered Marganeis.

In 364, the Arcadians reinforced their garrison at Olympia and, in company with some of the local inhabitants, who now formed the independent state of the Pisatans (*IvO* 36; *SEG* 22.339), began to celebrate the Olympic Games. The Eleians summoned their Achaean allies and marched toward Olympia. There they made a determined assault upon the Arcadians and their Argive and Athenian allies, driving them into the heart of the sanctuary and almost reaching the altar of Zeus. Their enemies, however, pelted them from the temple rooftops, killing Stratolas, the commander of the Three Hundred and one of the leading oligarchs, so they returned to their camp. When the Arcadians and their allies built a stockade around the sanctuary, the Eleians withdrew.

The Arcadian leaders had been using funds from the treasury of the temple of Zeus to pay their federal force, the *eparittoi*, which, because the pay enabled many poorer citizens to join, had maintained a democratic

character. In 363, payment from the temple treasury was discontinued, so the poorer citizens left and were replaced by wealthier ones. The *eparittoi* became more oligarchically inclined, and the Arcadian assembly voted to conclude peace with the Eleians and return Olympia to them.

Elite Troops

Elite troops in ancient Greece fall into two broad categories. The first includes professional citizen troops, often called *epilektoi* (lit. “chosen ones”) maintained at public expense by a *polis* or league. The second encompasses units marked for special favor or holding a special position in royal armies such as those of Philip II and Alexander the Great, or their Successors.

In the case of the first category, the states were essentially trying to replicate, on a lesser scale, the effects of the Spartan system. This freed the male citizens from the need to farm or earn a living so they could devote themselves to military training. Aristotle believed that the superiority of the Spartan hoplites stemmed not from the quality of their training but the fact that they trained while others did not. The rise of *epilektoi* in Greek states, especially in the fourth century may also have been influenced by this view.

Lacking the Spartan helot system or the *agoge*, other states used state resources to maintain their *epilektoi* so they could focus on hoplite training. This allowed greater professionalism while avoiding the risks of the alternative—mercenaries.

The most famous of these elite contingents was the 300-strong Theban Sacred Band, active from 378 to its destruction in 338. However, Elis seems also to have had 300 hoplite *epilektoi* (imaginatively called “The Three

Hundred”) ca. 365 when they and the cavalry suppressed a democratic revolution there. A similar body is attested at Argos; Athens also had a group of *epilektoi* (Aeschines served in it at the battle of Tamynae), although in these cases we know little or nothing of their organization, training, and level of state support—if, indeed, they had any.

Elite troops in monarchies, such as Macedonia, were originally the royal guard. The 300 *Hippeis* attested at Sparta, for example, probably guarded the king in battle and were used for special missions, such as the nationally symbolic recovery of the bones of Orestes. The famous “Three Hundred” killed with Leonidas at Thermopylae may have been the *Hippeis*. At Macedon, the heart of the cavalry was the Companion cavalry, under Philip II eight squadrons. One of these, the Royal Squadron, was 400 strong (twice the size of the standard squadron), consisted of aristocrats and the king’s personal companions and generally fought with the king.

Over time, Philip and Alexander’s Macedonian army itself became an elite force. The core of the Macedonian infantry under Philip was six *taxeis* or brigades of phalangites, called the *Pezhetairoi* or “Foot Companions.” They did not have the same status as the Companion cavalry, but enjoyed high regard, especially in the armies of the *diadochoi* (Successors). The 3,000 hypaspists, the Argyraspides (“silver shields”), also seem to have been regarded as an elite, confirming that both social status and professionalism could bring about elite status. Even within the hypaspists, the first *lochos* (regiment) had the title “royal” and was composed of the tallest soldiers.

Like the *epilektoi* of the Greek city-states, the Macedonian army had moved from citizen-soldier to professional status. This process was significantly advanced under Philip II but by the end of Alexander’s conquests, the whole army was a highly professional force. Although there is a strong cultural, or perhaps even racist, element in prizing the Greek and Macedonian troops over the local Asian ones, the sheer quality and professionalism of these units ensured them the status of elite troops, and a vital role, in the successor armies. The Argyraspides, for example, served with distinction until they betrayed Eumenes of Cardia in return for their baggage, captured at Gabiene (316). Although their new leader, Antigonos I Monophthalmus seems to have split them up, a unit called the Argyraspides was accepted into the Seleucid army after 312. By the time of the battle of Magnesia (190), the Argyraspides were Antiochus III, the Great’s Royal bodyguard.

Epaminondas (d. 362)

Epaminondas was one of Thebes' two most famed and effective generals during the Boeotian League's highest era of power, the Theban Hegemony (371–362), and one of the most important figures in international Greek politics of this period. Source problems plague any reconstruction of his life: Xenophon, a contemporary, de-emphasizes Epaminondas' accomplishments; Cornelius Nepos' biography of him was written some three centuries later; and Plutarch's is lost. From what can be recovered, Epaminondas was born of a prominent Theban family probably around 410 and educated by a Pythagorean philosopher. He played a role in the expulsion of the Spartan garrison in 379. In 371, he represented Thebes at the peace conference in Sparta, where he argued for Thebes representing all the Boeotians, after which the Boeotians were expelled from the negotiations. King Cleombrotus' attempt to prevent the Thebans from bringing other Boeotian

cities into the Boeotian League led to the battle of Leuctra later in 371. Epaminondas may have been instrumental in this great Theban victory over Sparta by using a combination of relatively innovative tactics such as deeper phalanx rows and the Sacred Band in front of a strong left wing, although the opposing army was quite poorly manned as well.

Epaminondas led invasions of the Peloponnese over the next two summers, utilizing Theban armies and allied armies from Arcadia, Argos, and Elis. On these expeditions he freed the Messenian Helots and probably helped to establish the cities of Ithôme/Messene in Messenia and Megalopolis in Arcadia. Between these expeditions he faced domestic opposition from rival politicians accusing him of misconduct, but was not convicted. He saw further action in 368–367 in Thebes' dealings with Thessaly and Macedon, and through his alliance Thebes recovered Pelopidas and Ismenias from Alexander of Pherae, who was holding them hostage. He assaulted Achaia in 366 and forced it into alliance with the Boeotian League, although its cities later went to Sparta, retook Oropus, and advocated the construction of a 100-ship fleet and alliances with many Aegean powers. He drove off an Athenian fleet in 364, the year Pelopidas died at Cynoscephalae. Epaminondas was certainly the mastermind behind Thebes' excellent tactics at the battle of Mantinea in 362, where he perished, supposedly stating that he did not die childless, but that the battles of Leuctra and Mantinea were his daughters. Diodorus regarded him as the best man of his generation.

The impact of Epaminondas' life and death are huge. His leadership was instrumental in vaulting the Boeotian League and Thebes into the first rank of Greek international powers. His death did not bring the death of Theban/Boeotian power, but did surely hasten it.

Ephebes, *Ephebeia*

Although it later became a general term for “youth,” “ephebe” (*ephebos*; pl. *epheboi*) seems to have been coined in Athens in the early fourth century to denote a participant in Athens’ youth training program, the *ephebeia*. This influential institution was widely copied, including in the Hellenistic cities of the Aegean and Asia Minor. The institution may well have existed in some form in the late fifth century (Thucydides records the “youngest” Athenians guarding walls and garrisoning border forts in the third quarter of that century), but it appears to have been formally established in its full form sometime early in the fourth century. Prior to this, ephebes, who manned the walls or frontier posts did so on an as-required basis like the rest of the army. A few years before 334 the *ephebeia* was reorganized into the form we know best.

This form, described in the *Athenian Constitution* (*Athenaion Politeia*) ascribed to Aristotle, prescribed a two-year period of military service for Athenian youths between the ages of 18–20. In their first year they lived communally, received four obols a day pay, and undertook training as hoplites but also with the bow, javelin, and catapult (cavalry training was added in the Hellenistic Period). In their second year (after a public demonstration of what they had learned), they were presented with a shield and spear at public expense and protected the borders by manning the border forts and conducting border patrols. The ephebes swore an oath (preserved in Lycurgus’ speech *Against Leocrates*, and in an inscription) not to dishonor their arms or abandon their mates, and to leave Athens greater, not smaller, than at the time of their oath. The institution guaranteed Athens had a standing border protection force and ensured a base level of training for its military age citizens. The *ephebeia* survived into the Roman period, although it took on an increasingly less military character.

Ephesus, Battle of (409)

The battle of Ephesus was an Athenian defeat during the Second Peloponnesian War (431–404). The Athenian force under Thrasyllus (Diodorus mistakenly has Thrasybulus) consisted of 1,000 hoplites, 100 cavalry, and 500 sailors equipped as peltasts. The defending force, which the Persian satrap Tissaphernes had gathered from around the region, was of unknown size but included Ephesians, Persians, and ships' crewmen from Syracuse and Selinus in Sicily. Thrasyllus landed his hoplites on one side of the city and his cavalry and peltasts on the other, ordering them to advance simultaneously. However, he was defeated in detail when the entire enemy force attacked his hoplites, killing 100, and then turned against his cavalry and peltasts, killing around 300. Thrasyllus recovered the dead under a truce and sailed back to Notium where he buried them. Lysias, *Against Diogeiton*, tells the story of the effects the death of one of the Athenian hoplites had on his family.

Ephialtes, Athenian (d. 461). See Assassination; Cimon; Pericles

Ephialtes, Malian (Active ca. 480)

Ephialtes, son of Eurydemus of Malis was the man who told Xerxes about the Anopaea path, enabling him to outflank the stubborn Greek defense at Thermopylae. According to Herodotus, Ephialtes was motivated by financial gain. The maneuver was successful and the pass forced, opening the Persian way south. After the war, Ephialtes had a price on his head but was killed for an unrelated reason. Herodotus records, but rejects, an alternative version that blamed two other men for the betrayal.

Ephorus (ca. 400–330)

Ephorus from Cyme in Asia Minor, produced a massive history in 30 books, the first “universal” history dealing with the whole past of the Greeks and peoples known to them. It went down to ca. 340, but did not include the Third Sacred War, 355–346, which was added by his son Demophilus. Ephorus avoided mythological times and began with what was regarded as a historical event, the return of the descendants of Heracles to the Peloponnese (in approximately 1102 on standard reckoning).

His work became the standard account of Greek and “barbarian” history. It survives only in numerous quotations and references, although the *Historical Library* of Diodorus, books 11–15, which made heavy use of Ephorus, and to a lesser extent books 1–5, have been taken to give some idea of his work. However, it is not justified on present evidence to assume that Diodorus’ faults are due in whole or part to Ephorus. As with all historians whose works are lost and known from fragments, statements about Ephorus that go beyond observable fact are inferences of highly

variable plausibility.

Ephorus was censured in antiquity for a lackluster style but his erudition and laboriousness were acknowledged. What little is known of his methods in dealing with the extremely poorly documented early times does not inspire confidence. There are, however, indications that in investigating contemporary and near-contemporary events he had some sense of a historian's task, even if he was given to moralizing. He undertook some independent enquiry and at times reached his own judgments when working over his predecessors, Herodotus and Thucydides. Polybius, an acerbic critic of other historians, treated him seriously and commended his capacity for describing naval battles (12.25f: a back-handed compliment?).

Epibatai

Epibatai (sing. *epibates*) denoted soldiers fighting from any platform, such as a chariot, elephant, or warship but is most commonly used for marines serving on a warship. A trireme had a complement of 14 *epibatai* (10 hoplites and 4 archers) but the later, and larger, Hellenistic ships carried more. Most marines were equipped as hoplites (see illustration in Naval Warfare entry) and were used to board enemy ships (or repel boarders) or as infantry in amphibious landings. Athenian *epibatai*, operating in Aetolia in 426, are described by Thucydides (3.98) as “by far the best men Athens lost in the war,” suggesting that they were drawn from the normal hoplite rolls. However, 700 Athenian marines deployed to Sicily in 415 were *thetes* (i.e., non-hoplites) who were probably equipped by the state. Marines could be as effective as line hoplites on land, for example, winning the battle of Mycale (479) against a much larger Persian army.

Epidamnus

Founded in 627, Epidamnus (modern Durrës in Albania) was a Corcyraean colony, with the *aesymnetes* (founder) and some colonists drawn from Corcyra's own mother city, Corinth. Located on the Adriatic, Epidamnus was important for trade with Illyria. Around 300, the city became known as Dyrrachion (after the headland on which the city was located), which became Dyrrhachium in the Roman period.

In the Classical Period, Epidamnus was ruled by a narrow oligarchy. However, following a period of internal *stasis* or struggle, by 435 a democratic party had expelled the oligarchs. The oligarchs regrouped and besieged the city, which appealed to Corcyra for aid. When this was refused the democrats appealed to Corinth. The poor relations between Corinth and Corcyra led to Corinth assisting the democrats and then Corcyra intervening and capturing the city. The resultant naval clash between Corcyra and Corinth drew in the Athenians and was one of the events leading to the outbreak of the Second Peloponnesian War in 431. Little more is known of Epidamnus until the Roman period and, as the modern city is built on the site of the ancient one, limited archaeological evidence has been recovered.

Epiphanies, Military

It is not just in Greek myths, such as the stories of Troy, that we hear of the gods fighting in the battles of men: accounts of historical battles also contain testimony of the direct involvement and appearance of divinities. The appearance of gods and other deities on the battlefield or in other contexts was known as an epiphany. Epiphanies were widely accepted as genuine by the ancient Greeks. Themistocles, like many of his compatriots, directly attributed the victory at Salamis to the gods and heroes (Herodotus 8.109). Sometimes these gods were prominent deities, but often these divine allies were local heroes, whose shrines were situated close by. The related term, *epiphaneia*, was also used to describe divine actions of the gods, but in which the gods did not necessarily show themselves.

It is not surprising to find a number of epiphanies reported during the Persian Wars, when the future of the Greek world itself was at stake, and the fears and anxieties of the Hellenes were at their highest. Accordingly this was the time when they most expected their gods to fight alongside them, as the case of the righteous Greek against the impious barbarian was less ambiguous than a conflict in which a Greek was fighting a brother Greek, who shared the same gods.

At the battle of Marathon in 490, it was widely believed that the goat-god, Pan, the Attic hero, Theseus, and a local chthonic hero that an oracle identified as Echetlaeus, participated directly in the battle against the Persians. Pan even struck a deal with the Athenians, via the messenger Philippides, in which he bartered his support at Marathon in return for the Athenians setting up a cult in his honor. At the battle of Salamis, 10 years after Marathon, the Athenians reported visions of armed heroes, the sons of Ajax, protecting the Greek fleet. Ajax, Telamon, and other heroes were invoked because of an earthquake in the area on the eve of the battle. Herodotus also tells us that before the battle a supernatural cloud of dust arose at nearby Eleusis from which could be heard the chant of "Iacchus" associated with the Eleusinian Mysteries. A giant serpent was also seen

swimming with the Athenian fleet, which Pausanias said was a manifestation of the local hero, Cychreus. While no battlefield apparitions were reported at the battle of Plataea in 479, Herodotus makes the point that no Persian was allowed to die upon land sacred to Demeter near the battlefield, because she had been so angered by the desecration of her sanctuary that she would not permit it.

Attacks on Delphi, the most sacred panhellenic sanctuary of Greece, would be another context in which we would expect to find a high incidence of reported battlefield epiphanies. Herodotus says that when the Persians attacked the sanctuary in 480, two giant local heroes, whom the Delphians identified as Phylacus and Autonou̓s, were seen fighting the Persians. He even goes as far as to say that this epiphany was originally reported to him by the Persian survivors themselves. Two centuries later, Apollo himself is recorded, on a *stele* set up by the victors, as having assisted Delphi against the marauding Gauls.

Battlefield epiphanies did not necessarily involve a vision of gods and/or heroes in the form of men or animals lending their support against the enemy. They could also manifest themselves as natural phenomena. For example, at Aegospotami in 405, the Dioscuri were believed to have appeared in the form of stars floating on either side of Lysander's ship. But note that these hero-twins (Castor and Pollux) were favorite battlefield deities of the Spartans. They were actually invoked when both Spartan kings marched into battle and the Spartans would have been actively looking for signs of their presence. They would have been keen to interpret anything unusual on the battlefield, such as the strange lights above the rudder, as an actual epiphany of the Dioscuri.

Sometimes it was the appearance of strangers which was later interpreted as an epiphany. For example, at Argos in 272 an unknown woman was said to have hurled the very tile that struck and killed Pyrrhus. This was later explained by the Argives as an *epiphany* of the goddess Demeter.

Just as the Greeks believed that the gods and heroes could fight alongside them, they also believed that gods and heroes could fight against them; even favoring the side of the barbarian. Herodotus reported a story that he had heard in which a giant bearded phantom was seen by a man named Epizelus, fighting against the Athenians at Marathon. This specter even killed the man next to him. As a result of this vision, Epizelus claimed

that he lost his sight.

Not all claimed epiphanies were accepted and there were even cases of fraud reported. For example, Herodotus describes a scam by Peisistratus, who dressed up a tall, handsome woman named Phya as the goddess Athena and had her drive him into the city on a chariot. Herodotus seems amazed that the Athenians were so easily duped by this cynical ruse. Although not all Greeks believed that deities could appear in the mortal world, particularly in anthropomorphic form, most Greeks seem to have been prepared to accept the notion that the gods appeared and fought on the battlefield at critical junctures. Plato's Socrates may have argued that it was foolish to believe that perfect beings would change their shapes into "corrupt" mortal forms, but his views were hardly orthodox and did not represent the common view.

Epirus, Epirotes

The northwest region of the Balkans, between Albania and Greece. Although Epirus was home to the most popular Greek oracle after Delphi, the oracle of Zeus at Dodona, fifth century sources considered the Epirotes barbarians. According to Theopompus, the population of Epirus was divided into 14 tribes, the largest of which were the Molossians (F382). In 370, the Aeacidæ emerged as Epirus' monarchs. In 359, the King Arybbas sealed a symmarchy with Philip II of Macedon through the marriage of his niece, Olympias. Arybbas was succeeded by Alexander of Epirus, whose alliances in southern Italy and Sicily formed the Epirote Confederacy. In 334, Alexander assisted Taras against the Italians. This move resulted in his death at the battle of Pandosia in 331 and the dissolution of this

confederacy. Pyrrhus was king of Epirus from 306 to 303 and from 295 to 272. He focused on developing his capital, Ambracia, and involved Epirus in the Third Samnite War (282–276). The monarchy fell in 232. The subsequent Epirote League joined several wars between Rome and Macedon. The Romans in 167 sacked Epirus. Augustus chose central Epirus as the site of Nicopolis, built in honor of his victory at Actium.

Epiteichismos

Epiteichismos is a term for building near or inside an enemy frontier fortifications that often served as a forward base for operations. Two of the most famous examples occurred in the Second Peloponnesian War (431–404)—the Athenian occupation of Pylos (425) and the Spartan occupation of Decelea (413). In both cases, the fort was used as the base for continual operations against the enemy and proved particularly effective at Decelea. The tactic was little used after the developments in siege warfare in the fourth century and the Macedonian domination of Greece.

Eretria

Eretria was one of the two main cities on the island of Euboea, situated on the island's west coast facing toward the northern coast of Attica across the narrow southern Euboean Gulf. Settlement on the site is visible from the ninth century onward, and Homer includes the city among those that sent ships to Troy. Together with Chalcis, Eretria settled colonies throughout the Mediterranean, including on the nearby Aegean islands of Andros, Ceos, and Tenos, and at Pithecusae in southern Italy. Extensive trade contacts existed with Syria.

Eretria was believed to have fought and lost the legendary Lelantine War against its neighbor Chalcis. In the 490s, Eretria supported the Ionian Revolt against Persian rule, and so with Athens became one of the targets of the Persian invasion of Greece during the Persian Wars. The city was sacked and burned by Datis, the admiral of Darius I, in 490, although Eretria managed to send a contingent of hoplites to the battle of Plataea in 479. Eretria was a member of the Delian League/Athenian Empire, but revolted (with other parts of Euboea) in 446 and 411. The city joined the Second Athenian Confederacy in 378/7, but again revolted in 349, before supporters of Macedon gained the city in 343. Although recaptured by Athens in 341, it was absorbed into the growing Macedonian kingdom. Sacked by the Romans in 198 during the Second Macedonian War, it was nominally free from then on.

Etruria, Etruscans

Inhabiting northwest Italy, the Etruscans were linguistically and culturally distinct from the Italic tribes to their south and west. As a seafaring power, they resisted the intrusion of Greek colonial settlement in their sphere and ca. 540 combined with Carthage to wipe out a Phocaean colony at Alalia in Corsica. In the sixth century, they expanded eastward across the Apennines into the Po valley. They had earlier moved southward into Campania, founding Capua ca. 600. There they came into conflict with Cumae, the northernmost Greek colony in Italy and were defeated in a great battle (505) by Aristodemus, tyrant of Cumae. In 474, an Etruscan naval attack on Cumae was defeated by a combined Syracusan and Cumaean fleet.

The Etruscans were heavily influenced by Greek culture in art, architecture, and religion and were a major market for imported Greek luxury goods, especially painted pottery. Spina near the mouth of the Po River was a major depot of Greek–Etruscan trade, including the export of grain. From the early fifth century onward, Celtic expansion into the Po valley limited the Etruscan sphere. To the south, Samnite expansion reduced their control of Campania and the growing power of Rome first checked Etruscan expansion and then made inroads into their territory.

Etruria itself was remote from any Greek sphere for most of its history. Etruscan piracy against Greek shipping in the Adriatic continued to be a problem down to the end of the fourth century. In 325/4, Athens established a colony in the Adriatic to provide a naval station for countering Etruscan piracy (Harding 121).

Euboea, Euboeans

Euboea is a long island that stretches along the coast of Boeotia (modern Greece) from the Gulf of Pagasae in the north to the island of Andros in the south. It is the second largest island in the Aegean, and was also known as *Makris* or the Long Island. Its main cities during the Classical Period were Chalcis and Eretria. Between those two cities, on the headland of Xeropolis, was the town of Lefkandi which was one of the island's most important sites from the Early Bronze Age until the seventh century, with extensive trade contacts as far afield as Syria and Italy.

The island was supposed to be the site of the legendary Lelantine War, fought over the Lelantine Plain between Chalcis and Eretria. Parts of this plain were later settled by Athenian colonists in the late sixth century, before being conquered by Darius I. In the fifth century, the battle of Artemisium was fought off the north end of the island which subsequently became part of the Delian League/Athenian Empire. Euboea unsuccessfully revolted in 446 and Athens planted cleruchies on the island, which became a major source of grain and other products for Athens. Thucydides mentions the extreme shock felt by Athenians when Euboea revolted in 411. In the fourth century, the cities of the island joined the Second Athenian Confederacy in 378/7. During the third century the island became part of the Macedonian kingdom, before being declared free by the Romans in 196.

Eucratides the Great (Reigned ca. 170–145)

Eucratides was a Hellenistic king known in ancient literature for ruling “a thousand cities.” He reigned ca. 170–145 in Bactria and ancient northwest India, as far as West Punjab. His enormous and diverse coinage shows that he commanded vast resources and territories. Many of his coins are bilingual in Greek and Prakrit. He also produced the largest known gold coin from the ancient world, a 20-stater piece. Eucratides does not have a clear royal lineage, but it is possible that his mother was royal while his father was not. Certain of his coins depicting his parents show only his mother wearing a diadem. Royal blood or not, Eucratides was most likely a usurper. He was initially based in Bactria in a capital city called Eucratidia, which may have been located at the archaeological site of Ai Khanoum, Afghanistan. He was frequently at war with neighboring kingdoms, especially the Parthians, a Seleucid-breakaway dynasty under the leadership of the nomad Arsaces. Over time, these wars weakened Eucratides and he lost a substantial amount of territory to his enemies. Eucratides’ greatest military success was his conquest in India. Demetrius II, an Indo-Greek king, ruled in northwest India and rivaled Eucratides. He attacked and besieged the Bactrian for five months, but Eucratides, while vastly outnumbered, managed to break the siege, defeat Demetrius, and take over his Indian lands. This conquest may be the reason he gave himself the title *Megas*—“the Great.” Though he ruled for a long time, Eucratides was eventually killed by his own son.

Eumenes I of Pergamum (Reigned 263–241)

Eumenes was the nephew and adopted heir of Philetaerus of Pergamum and succeeded his uncle in 263. He took further steps to the independence of Pergamum from the Seleucid Empire than his predecessor, and he ruled for 22 years until his death in 241.

An inscription (*OGIS* 1.266, Document 20) relating to concessions Eumenes made to his mercenaries suggests that Eumenes (or possibly his predecessor) had established mercenary garrisons at Attalia in Lydia and Philetaerea-under-Ida in the Troad. War with the Seleucid Empire in 262 resulted in Eumenes defeating the Seleucid king Antiochus I in a battle at Sardis.

Celtic tribes (Galatians) had crossed from Europe to Asia in the first quarter of the third century BCE and settled on both sides of the Halys River (the modern Kızılırmak). They levied tribute on the whole of Asia Minor as far as the Taurus Mountains from their territory known as Galatia. Eumenes, too, appears to have paid them tribute.

During his rule, Eumenes appears to have concentrated on securing and consolidating his possessions in Asia Minor and never adopted the title of king. Eumenes was the patron of the philosopher Arcesilaus of Pitane in Aeolis. He allegedly died of drunkenness and was succeeded by Attalus I.

Eumenes II of Pergamum (Reigned 197–159)

Eumenes was the eldest son of Attalus I of Pergamum, the brother of Attalus II, and the father of Attalus III. During his reign the Pergamene

kingdom rose to the height of its power. He embarked on an extensive building program making his capital of Pergamum one of the beautiful cities of the Hellenistic world.

Eumenes inherited his father's alliance with Rome, and in refusing an alliance with the Seleucid king Antiochus III the Great, provoked the Syrian-Roman War (192–188) playing a decisive role in the battle of Magnesia in 190. With the Peace of Apamea in 188, Eumenes was given most of the Seleucid territories in Asia Minor and the Thracian Chersonese, including the city of Lysimacheia.

His Roman allies gave him diplomatic support in his war against King Prusias I of Bithynia. War between Eumenes and Pharnaces of Pontus between 182 and 179 resulted in victory for Eumenes and more territorial gains.

In 172, Eumenes denounced Perseus of Macedon to the Roman Senate, which led to the outbreak of the Third Macedonian War (171–168) against Perseus, during which Eumenes sacked Abdera. However, the political maneuverings of Eumenes during the conflict aroused the suspicion of Rome, who lost trust in him. Eumenes died in 159 and was succeeded by his brother Attalus II of Pergamum.

Eumenes of Cardia (ca. 361–316)

Eumenes was a high-ranking Greek within the Royal Macedonian Court,

where he worked as personal scribe (*grammateus*) to Philip II of Macedon and Alexander the Great. He rose to prominence during the Wars of the Successors, after Alexander's death.

Eumenes' entry into the Macedonian Court occurred around the age of 19, either because of his father's friendship with Philip II or because of Philip's appreciation of his physical and intellectual ability (Plutarch, *Eumenes* 1.1). It was during this time that Eumenes forged close ties with the Royal Argead Family, and was elevated into the famed Companions (*hetairoi*).

Eumenes was given a minor military command during Alexander's Indian Campaign in 326. After the death of Hephaestion in 324, Eumenes was promoted to the position of a cavalry commander (*hipparch*) within the Companion Cavalry, replacing Perdiccas who was promoted to Hephaestion's former office.

After Alexander's death in 323, Eumenes was appointed as governor (satrap) of Paphlagonia and the yet unconquered Cappadocia. Calls for support in securing Cappadocia were ignored due to Eumenes' non-Macedonian heritage. Eventually, assistance came in the form of Perdiccas, who helped Eumenes secure the region.

During the Wars of the Successors, Eumenes allied with Perdiccas against a coalition that included Antipater, Antigonus, Craterus, and Ptolemy. When Perdiccas was killed in Egypt, Eumenes assumed the leadership of the faction and continued campaigning in Asia Minor. After Gabiene Eumenes was betrayed by his own men, arrested, turned over to Antigonus, and executed.

Eurybiades (Active ca. 480)

Eurybiades, a Spartiate, commanded the allied Greek fleet that fought the battles of Artemisium and Salamis during the Persian invasion in 480. Sparta had little naval experience at the time and provided only 16 ships out of 378, but Sparta's allies demanded a Spartan commander. Eurybiades had to deal with fierce disputes among the commanders of individual contingents, especially Adeimantus of Corinth and Themistocles of Athens. Above all, he had to keep the Athenian fleet of 180 triremes from pulling out of the war. At a crucial point on the eve of the battle of Salamis, Eurybiades was persuaded by Themistocles that the right thing to do was to stay and fight in the channel between Salamis and Attica. Eurybiades was awarded the prize of valor, an olive wreath, for his command at Salamis.

Eurydice (d. 317)

Eurydice, the daughter of Cynane, the daughter of Philip II and an Illyrian consort, and Amyntas IV, the son of King Perdiccas III of Macedonia was born between 338 and 335. Known first as Adeia, she took the name Eurydice after her marriage to Philip III Arrhidaeus. She appears to have been trained in military skills by her mother. At the death of Alexander the Great, Eurydice and her mother raised an army and crossed into Asia, to bring about her marriage to the new king. Perdiccas sent Alcetas to prevent this, and in the altercation that followed, Cynane was killed. Her murder did not sit well with the soldiers, who came close to mutiny and forced their commander to allow the marriage to take place.

Still in her teens, Eurydice wielded considerable political power. For a time she received support for her ambitions, causing problems for the regents and guardians of the kings. She was able to evade the control of the

regent Polyperchon, and when her position was threatened by Olympias, she formed an alliance with Cassander. Her downfall came about when she brought an armed force against Olympias. Eurydice's army defected, and she was captured with her husband and imprisoned. Philip III Arrhidaeus was soon executed, and after tending to his body, Eurydice was forced to commit suicide. According to Diodorus (19.11), Olympias sent Eurydice "gifts," making her choose between a dagger, rope, or poison. However, she chose to hang herself by her own girdle.

Eurymedon, Battle of (ca. 467/6)

The battle of Eurymedon was a major Greek naval victory over Persia near Phaselis in Pamphylia (southern Asia Minor) in 468/7 or 467/6. The Athenian Cimon commanded the Delian League fleet of 300 triremes (200 Athenian and 100 allied ships); the Persians probably had around 350. This was Persia's last direct attempt to challenge Athenian naval superiority in the operations following the Second Persian War.

Cimon attacked the Persian fleet while it was mustering, supported by an army, at the mouth of the Eurymedon River before the imminent arrival of 80 Phoenician warships en route from Cyprus to reinforce it. Reflecting a greater emphasis on amphibious operations than before, the Athenian ships now carried a larger contingent of hoplite marines (see illustration in Naval Warfare entry). The ships had also been modified to make it easier for the marines to move around in an engagement. The Persians were quickly driven onto the shore and sought refuge with their army. Cimon landed his marines and defeated the Persian army, then intercepted and destroyed the Phoenician reinforcements. The scale of the Persian disaster was huge—200

ships captured, in addition to an unknown number sunk, and it gave Athens naval control in the Aegean for most of the rest of the century.

In the fourth century, Eurymedon was remembered in Athenian oratory as the high point of the Athenian struggle against Persia ushering in an unprecedented period of Athenian naval domination.

Euthydemus I of Bactria (Reigned ca. 230–200)

Euthydemus I was a king of Hellenistic Bactria who came after Diodotus II and ruled ca. 230–200. He was not the legitimate heir, but a usurper who fought and defeated Diodotus. Little is known of Euthydemus' background except that he was Magnesians. A major event of his reign was the war that he fought (ca. 208–206) with the Seleucid king Antiochus III, who was attempting to regain eastern territories lost by his predecessors. Euthydemus' army was large and intimidating, and included at least 10,000 cavalry and an elephant corps. In the defining battle, after extensive fighting and many casualties, Euthydemus was forced to retreat to Bactra, where he was besieged by Antiochus for two years. After lengthy negotiations via the Bactrian envoy Teleas, Euthydemus persuaded Antiochus that if allied, they could fend off the greater, mutual danger of bellicose nomads. Antiochus agreed, and permitted Euthydemus to maintain independence, especially after the latter sent his son Demetrius to meet the Seleucids. Antiochus was so impressed with the young man that he promised him a daughter in marriage. Antiochus also, however, confiscated Euthydemus' elephants.

Silver tetradrachm of Euthydemus I of Bactria, minted in Bactria ca. 230–200. Euthydemus, who usurped the throne of Bactria ca. 230 and probably ruled from Ai Khanoum, is depicted here in the traditional royal diadem. Located in the Yale University Art Gallery, New Haven, Connecticut. (Yale University Art Gallery)

Euthydemus likely established Demetrius as a coruler after the prince expanded their kingdom into India. Coin evidence shows that Euthydemus ruled for a long time, as his portraiture displays distinct phases of aging in his features. He likely ruled in the Hellenistic city located at the archaeological site of Ai Khanoum, as significant numbers of his coins were excavated there. Euthydemus did not publish an epithet for himself on his coins, but a later Greco-Bactrian king issued commemorative coins calling Euthydemus *Theos*—“the God.”

Evagoras (ca. 435–374/3)

A king of Salamis in Cyprus from ca. 411–374/3, who was instrumental in achieving Cypriot independence from Persian rule in the late fifth/early fourth century. His reign is recorded in speeches by the great Athenian orator and panegyricist, Isocrates. Despite being nominally a part of the Persian (Achaemenid) Empire throughout the fifth century after its conquest by Cyrus, the dominant cities of Cyprus retained a degree of independence with their own ruling dynasts.

During his youth, Salamis had fallen under Phoenician domination, and Evagoras was exiled to Cilicia. While there, he gathered loyal followers and in 411 returned to the island and seized the Salaminian throne. While it is true that he orchestrated a period of Hellenization on Cyprus, encouraging ties with Athens (Conon found shelter with him after Aegospotami), Isocrates' portrait of him doing so in defiance of the Great King cannot be accurate. Over the next two decades he extended his reach over almost the entire island. In 391, the remaining free cities appealed to the Persian king Artaxerxes II for assistance. The Athenians sent 10 triremes to support Evagoras, but they were captured en route by the Spartans.

Persia had no interest in a unified and Hellenized Cyprus, but Evagoras' revolt lasted for a decade, with assistance from Egypt. In this time he extended his power to parts of Cilicia and Phoenicia. Eventually in 382, the Persians sent an overwhelming force, and Evagoras came to terms. He was permitted to retain the throne of Salamis, but was forced to give up designs on the rest of Cyprus. He was assassinated in 374 in a court intrigue and was succeeded by his son Nicocles.

Exiles

Greek states commonly imposed capital penalties (death, confiscation of property) for serious political crimes. Defendants often chose to flee into exile rather than face trial. An exile returning to his native land would be executed if caught. Some states also imposed on those convicted of major crimes the formal legal penalty of expulsion for life from their territory. Such penalties could be imposed for a range of crimes, such as murder, but exiles were more likely to be political offenders. Another source of exiles was the appropriation of another state's land by an imperial power. A notorious case of this was the expulsion by Athens in 365 of the population of Samos and the settling of citizens of its own there. The Samian exiles were not restored to their homeland until Macedonia enforced this in 322. The people of Plataea were twice driven into exile: first, by the Boeotian siege and destruction of their city (429–427) and then by the Boeotians' destruction, for the second time, of their city in 373. When a city continued to exist, exiles from it were naturally opponents of the existing regime. They had every motive to bring about a change of regime and the only way open for them to do this was by force. The result was that exiles in the Greek world were a significant group and a constant source of instability.

When expelled from their city, exiles could set themselves up in a fortified position in or near the territory of their city and engage in a guerilla style war of raiding with the ultimate aim of winning control of their city. An early example is the occupation of the hill of Leipsydrium in Attica by the exiled Athenian aristocrats, the Alcmaeonidae, who were

opposed to the Peisistratid tyranny. They were soon driven out (*Ath. Pol.* 19.3). A later example is democratic exiles from the island of Chios who were driven out in 410 when Chios took the side of Sparta and became an oligarchy. The exiles occupied Atarneus, a position on the mainland opposite Chios, from where they kept up raids for at least the next 13 years (Xenophon, *Hellenica* 3.2.11).

Exiles are often found fighting alongside the enemies of their state, such as the Tegean exiles fighting in defense of Sparta in 370/69 (Xenophon, *Hellenica* 6.5.24), or a Spartiate exile with the Boeotian army at Leuctra (Diodorus 15.54.1). Bands of exiles could attempt an attack on their city on their own (like the Achaean exiles ca. 366: Xenophon, *Hellenica* 7.1.41–43) but they were more likely to collaborate with foreign invaders. In 446, Boeotians who had gone into exile under the Athenian domination of their region made an invasion in force, capturing a number of cities. An Athenian punitive expedition was defeated at Coronea (447) by a mixed force of local opponents and exiles from Boeotia and Euboea (Thucydides 1.113). In 441, oligarchs exiled from Samos when Athens set up a democracy went to the mainland, obtained mercenaries from a Persian satrap and seized control of Samos (Thucydides 1.115).

The victorious side in war often demanded the return of a state's exiles when it imposed a treaty. Athens had to receive back its exiles in 404 at the end of the Second Peloponnesian War, including hardline oligarchs who had been expelled after the failed oligarchic coup of 411. These fanatical friends of Sparta at once set about establishing the extreme oligarchy known as the "Thirty Tyrants."

The return of political exiles to the democratic state of Phlius in the Peloponnese was demanded by Sparta in about 385. Disputes at once arose over the returned exiles' claims to recover their confiscated property. Dissatisfied with their treatment in the law courts of Phlius, the returned exiles turned to their Spartan friends who demanded that Phlius set up a legal process that guaranteed them satisfaction. When Phlius imposed fines on those complaining to Sparta, they went into exile and Sparta declared war. It took some 20 months for Sparta to reduce Phlius by siege. In this time, the exiles from Phlius made up a separate and prominent part of the besieging force. At the end of the war Agesilaus forced Phlius to set up a committee of 50 returned exiles to establish a new (oligarchic) constitution and to decide which of their fellow citizens should be executed (Xenophon,

Hellenica 5.2.8–10, 3.10–21).

The problems over property and status caused by the demands of returning exiles were grave, and could be further exacerbated when the wives of exiles had remarried, or been remarried to, other husbands. The Greek world was thrown into turmoil when an order from Alexander the Great was read out at the Olympic Games in 324 ordering all states to receive back their exiles. Over 20,000 were on hand to cheer this extraordinary measure. The complications that this mass return of exiles caused can be seen in inscriptions from Tegea and Mytilene (Harding, nos. 113, 122) dealing with this crisis. Many Greek states sent embassies to Alexander protesting against this measure, which was so bitterly resented that it was a major cause of the Lamian War, when Greek states rose after Alexander's death against Macedonian domination. In this war, Athens was particularly motivated by the hope of retaining its possession of Samos.

As with many of Alexander's actions, it is not clear what his motives were in demanding the return of all exiles in 324. That he wanted glory and also wanted to have loyal supporters in all cities (Diodorus 18.8) cannot be the whole story. A highly plausible explanation is that Alexander was concerned about the instability that would be created in the Greek world by the large numbers of homeless exiles among the mercenaries he had discharged from service. Exiles had long been prominent among the floating population of the Greek world that was a prime source of mercenaries. The existence of these numerous "vagabonds" had worried the Athenian publicist and rhetorician Isocrates (436–338) and prompted him to propose a solution to this social problem: that the Greeks should conquer part of the Persian Empire and colonize it with this homeless population.

Considering that they were drawn from the educated and politically active upper-class levels of society, it is no mere coincidence that many of the leading historians in ancient Greece were exiles: Herodotus, Thucydides, Xenophon, Philistus, Theopompus, Timaeus, and Polybius.

F

Families of Soldiers

The Greeks viewed the family unit as those who lived within the household (*oikos*). These included elderly parents, a wife, children, and even slaves of the male citizen. War impacted on the families of citizen and other soldiers in different ways. Greek vases often present family scenes: the departing warrior farewelling his father, his wife, and young child. Family-combatants, however, rarely found themselves exposed on Greek battlefields to the dangers of war. Greeks would regularly evacuate their children, women, and other movable property in the face of enemy invasion either inside the walls of their city or to other places of safety. Thus, the Athenians sent their wives and children to Troezen, Salamis, and Aegina in the face of Persian invasion in 480. Two generations later they brought all their families inside their city walls when the Spartans invaded Attica in 431 and sent their flocks to Euboea. The Phocaeans abandoned their city en masse and sailed to Chios when the Persians began their siege.

Sieges affected families as much as combatants. As a result of major defeats and destruction families suffered banishment, enslavement, and death in the sack of cities or destruction of the land. Tyrtaeus refers to the horrors of exile for men, wives, and children in the seventh century and Isocrates (4 [*Panegyricus*]168, 5 [*To Philip*] 120–121) laments exiled wanderers (*planômenoi*) outcast with their children and women in the fourth century. At the end of the siege of Potidaea the Athenians allowed men to leave the city with a single garment and their women with two. It is only in sieges where women appear in any combat role at all, often throwing stones or tiles from rooftops at the enemy (famously Pyrrhus of Epirus died from such a thrown tile in street fighting in Argos). As always

the stories of the fall of Troy present the paradigm of Greek ideology in defeat. The Trojan men fought the Greeks in battle. The women and old men remained within the walls of the city, often watching the battle from the battlements in what became a literary trope called a *teichoscopy*. When the city fell Greek myth records the horrors that befell the men, women, and children of Troy. The men were killed, even the aged; thus Priam died, dragged from the Altar of Zeus. Some children died in the carnage of sack, thus Hector's son Astyanax was thrown from the walls. The women and children suffered enslavement. In historical times, such destruction and appropriation (*oikeiosis*) of communities was increasingly common. The best known of these played out at the island of Melos in the Second Peloponnesian War, where the Athenians killed all the males and sold the women and children into slavery in 416/5. Similar fates befell a number of cities that resisted Athens in the later fifth century (Xenophon, *Hellenica* 2.2.3–4) in an increasingly violent and bitter struggle.

As mercenary and more professional armies emerged in the fourth century, so the families of permanent soldiers had different relationships to warfare from those of their citizen counterparts. Families often followed marching armies as part of their baggage train. Pelopidas' mercenaries left their families at Pharsalus while they campaigned in Thessaly (Plutarch, *Pelopidas* 27). Garrisons, which became increasingly permanent in the imperial systems of the Macedonians and the Successor kingdoms in Egypt and across Asia, often had the families of soldiers attached to them. This was also true in the Persian Empire. These families presented special logistical needs. When the garrison troops (*phrouroi*) of Cyrus the Younger abandoned his expedition against the Great King in its early stages, rumors circulated that Cyrus might harm their families whom he had under guard at Tralles (Xenophon, *Anabasis* 1.4.8).

Soldiers often had children both in and out of the bonds of marriage. Alexander the Great made dispensations on behalf of the children of his soldiers and made some provision for their upbringing. This had a strategic basis, as the sons of soldiers laid the foundations for future Macedonian armies. Alexander's Successors employed vast numbers of professional soldiers across their kingdoms. Many of these played the role of garrison and frontier guards. They often had families of their own. The famous inscription that outlines the relationship between Eumenes II and two of his garrisons near Pergamum (OGIS I.266) has a clause that protects the rights

of inheritance for any children orphaned (*orphanikon*) due to the deaths of their fathers in military service. In the Seleucid Kingdom of Asia, military communities of settled soldiers (*klerouchiai*) laid the foundations for several generations of military personnel, as the sons of serving soldiers themselves became soldiers to replace their fathers. Thus, the children and wives of soldiers may not have been present on Greek battlefields, but they played a significant role in the military history of Greek warfare.

Fetters of Greece

The so-called Fetters of Greece were three strong points controlled by Philip V of Macedon in the early second century. According to Greek envoys to Rome in 200, Philip himself had coined the term. The three cities, all of which Philip controlled with garrisons, were Corinth, Chalcis, and Demetrias. Control of Corinth, astride the isthmus connecting the Peloponnese to northern Greece, was enough to keep the Peloponnesians in check. Chalcis, which controlled the narrow Euripus strait between Euboea and the mainland, allowed him to dominate central Greece. Demetrias, a major city near modern Volos, gave him a hold over Thessaly and northern Greece.

Philip's defeat by Titus Quinctius Flamininus in the Second Macedonian War (200–196) gave the three fetters into the hands of the Romans. At the end of the war, Rome's unhappy allies, the Aetolians, accused the Romans of intending to take over Philip's position and garrison the cities themselves. Initially, Flamininus did maintain garrisons in the three cities, but at the Isthmian Games of 196, he announced that Rome would withdraw its garrisons from the whole of Greece. Greece was freed of its "fetters."

Ironically, Rome returned Demetrias to Macedonian control in 189, as a reward for Philip's support against Antiochus in the Syrian-Roman War (192–188).

Finance and War

Archaic Greeks did not rely on public finance for war. Their wars were fought infrequently and usually over contested land between *poleis* (city-states). Typically they were initiated not by the state's rudimentary political institutions but by elite individuals in a private capacity (e.g., Herodotus 6.34–37). These leaders raised volunteers by promising them a share of the booty and the land which might be won in battle. The hoplites who volunteered usually only numbered in the hundreds. They came along with their own armor, weapons and food-supplies. Like the expedition's self-appointed commander, they too came mainly from the elite. Their wars went for days or weeks and were settled by a solitary battle. Because of the winning side's lack of military capacity, they usually did not result in the subjugation, occupation, or taxation of the other side's *polis*. In the Archaic Period, war was therefore a small-scale and private activity whose participants financed it themselves. Even after the sixth century, those states not aspiring to be major or dominant military powers like Athens, Sparta,

and Thebes persisted with this small-scale style of land warfare.

War changed in two big ways in the Classical Period. Both can be seen most clearly in the *polis* of Athens. In the fifth century, this state quickly became one of Greece's dominant military powers. Athens was largely responsible for making the wars of the Greeks reliant on public finance. The first change was that war became a public activity. In Athens, this was a result of the democratic reforms which the elite leader, Cleisthenes, sponsored after 508. They gave the Athenian *demos* (people) sole responsibility for initiating wars and a new public army of hoplites for waging them. The second change was naval warfare. Persia forced the Greeks to get serious about fighting at sea. The Athenians knew that the Ionian Revolt of 499 to 493 had been lost because of Persia's superior sea power. They knew too that the triremes of the Persians had got them to Marathon in 490. Persia financed its fleet through a unique feature of its empire: it required each dependent state to pay an annual tax that was based on an assessment of what it could afford. There was no parallel for this financing of war in Archaic Period Greece. Persia's Great King, Darius I, introduced this system of *phoros* (tribute) in 518 (Herodotus 3.89–97).

To get ready for Persia's next attempt to subjugate them the Athenian *demos* decided, in 483, to expand massively their public navy. As it cost about one talent, that is, 26 kilograms of silver, to build a trireme (e.g., *Ath. Pol.* 22.7), they could only afford this expansion because of unexpectedly high recent income from their local silver-mines. The 200 triremes they had at the end of this shipbuilding was the largest *polis*-owned fleet yet seen. So that there were enough captains for this fleet the Athenian *demos* created the liturgy of the trierarchy. This public service required an elite citizen to command a trireme for a year and to pay for its running-costs over and above the *misthos* (pay) of its crew. A trierarchy cost about one talent. The payment of trireme-crews was the responsibility of the state. Their *misthos* was a logical necessity: because the trireme lacked the space for the stowing of food-supplies, its crew had to purchase food each day from local markets or private houses. In addition, there was no guarantee that sailors would remain with their ships if they were not paid. Athenian trierarchs usually hired their sailors from those volunteering their services in the Piraeus, the port of Athens, or in other ports along the way. Because volunteers faced no sanction against desertion and could find employers elsewhere, they could, and sometimes did, desert if they were not paid.

Athens therefore had to pay its sailors. But doing so proved to be hugely expensive. A sailor was normally paid one drachma per day (e.g., Thucydides 6.31). This was the same as the *misthos* of a skilled laborer or a hoplite. There were 200 sailors on a trireme and so it cost 6,000 drachmas, that is, 1 talent per month to keep it at sea. This meant that Athens had to spend hundreds of talents to send out even a fraction of its fleet for the regular sailing-season of eight months. In the Persian War of 480 to 479, the Athenians resorted to emergency measures to pay for their fleet. But to keep on using it they had to find an adequate source of public finance. This they did in 478 when Ionia's Greeks invited them to lead the ongoing war against Persia. The multilateral alliance that Athens subsequently established is known as the Delian League. So that it could finance their naval operations League-members adopted the Persian method for funding war: they each promised to pay an agreed amount of *phoros* each year. In most cases, what each *polis* paid was the same as the annual tax which it had paid Persia. These tribute-payments added up to 460 talents per annum.

For its first decades, the Delian League campaigned nonstop to expel Persians from harbors across the Aegean Sea, to destroy Persia's fleet, and to liberate Ionia's *poleis*. At the same time, Athens started to undermine the independence of League members who, by 450, were subject to laws of the Athenian *demos* and had long been forcibly prevented from ceding from what was now the Athenian Empire. Imperial income allowed Athens to employ thousands of elite and nonelite Athenians as sailors and hoplites on campaigns which lasted months or, in the case of sieges, up to a few years. With *phoros* they could wage war more frequently than ever before and pioneer new forms of warfare on land and at sea. Athens became, for example, the Greek world's leading sea power and besieger of cities. Now it was widely recognized that war relied on public finance. Athenian politicians argued that their state's *dunamis* (military power) depended on warships, fortifications, and especially money (e.g., Andocides 3 [*On the Peace*]; Aristophanes, *Lysistrata* 170–176). Pericles even argued that Athens would win the Peloponnesian War of 431 to 404, because its public finances were so much stronger than Sparta's.

In spite of this financial strength, Athens still found the Second Peloponnesian War ruinously expensive. During the first 10 years, the so-called Archidamian War, the Athenian *demos* spent on average 1,500 talents per year. This was 15 times more than what they spent on state religion and

ten times more than on running their democracy. Because it also exceeded their state's annual income of 1,000 talents (Xenophon, *Anabasis* 7.1.27), the *demos* had to find extra funds urgently. In 428, the *eisphora* which they levied raised the unprecedented sum of 200 talents (Thucydides 3.19). The *eisphora* was an intermittent tax on the elite's property to pay for a war. In 425, the Athenians trebled the *phoros* of their imperial subjects to 1,200 talents (Andocides 3 [*On the Peace*] 8–9; Aristophanes, *Wasps* 656–657). By 421, however, when Athens won the Archidamian War, it had exhausted its cash-reserves of 6,000 talents (Thucydides 2.13; *IG I³* 369).

The Peace of Nicias of 421 to 416 saw these reserves quickly restored (Thucydides 6.26). Sparta had long been Greece's dominant land power, because its hoplites, as full-time professionals, fought much better than its enemies and it could force its allies to provide further hoplites for its wars without the need to pay them. But the enormous army which Sparta could raise proved ineffective against Athens. Whenever, in the course of the Peloponnesian War, it entered Athenian territory, the Athenians simply withdrew within their fortifications, imported food-supplies by sea and waited for their enemies to leave. Now the Spartans realized that they could only defeat Athens if they became a major sea power. But to become one they too had to find a way to meet naval warfare's astronomical costs. Sparta found a way in 413, after the destruction of the enormous expeditionary force that Athens had sent to conquer Sicily. Persia saw this destruction as the best opportunity in decades to get rid of the Athenian Empire. In exchange for regaining the right to levy *phoros* on Ionia's Greeks, it thus provided Sparta with enough gold to build and to maintain a fleet. In the course of the last part of the Peloponnesian War, the Ionian War, this Spartan fleet came to surpass what was left of the Athenian fleet. In 405, Sparta easily destroyed the last of the Athenian triremes at Aegospotami in the Dardanelles and so was able to force the surrender of Athens by a land and sea blockade. With its full control of the Aegean Sea it subjugated the last of the *poleis* that supported Athens and so brought the Athenian Empire to an end.

In Greece's next 10-year-war, the financial support of Persia was again decisive. The Corinthian War, which started in 395, got its name from the battles which were fought about Corinth. This war pitted Sparta against three of its former allies, Argos, Corinth, and Thebes, who were now allied with Athens. Initially the Great King, Artaxerxes II, funded this anti-

Spartan alliance, because the Spartans had abandoned the treaty they had struck with him during the Second Peloponnesian War. Instead of letting him levy *phoros* on Ionia's *poleis*, the Spartans were now fighting him for control of them. Athens used Persia's gold to rebuild its fortifications and fleet. With these triremes it attempted to reestablish the Athenian Empire. Athens was now forcing Greek *poleis* in Ionia and the Dardanelles to be its subjects again. On them Athens reimposed the 5 percent tax on their maritime trade (e.g., *IG* II² 24), which it had first introduced in 413 (Thucydides 7.28.4). It also reimposed another public-finance measure which dated back to the Ionian War: the 10 percent tax on merchant ships through the Dardanelles (Demosthenes 20 [*Against Leptines*] 60).

These Athenian actions manifestly were at Persia's expense. By the early 380s, Athens was even backing revolts against the Persian Empire in Cyprus and Egypt. Artaxerxes II thus realized that by helping Athens to fight Sparta he was fighting fire with fire. The Athenians were now a bigger threat to his empire than the Spartans would be. Consequently, the Great King agreed to support Sparta financially as long as he got complete control of Ionia's Greeks. With Persia's financial support the Spartans assembled and quickly manned 80 warships and sailed to the Dardanelles where they stopped the grain ships sailing to Athens. This action brought the Corinthian War to a speedy end. The Athenian *demos* feared being starved into submission as they had been in 405. Thus when Persia summoned to Sardis all those who wished to hear the general peace-treaty which it wanted, the ambassadors of Sparta and the anti-Spartan alliance arrived with flattering speed.

The King's Peace of 387/6 scuttled completely the attempt of Athens to rebuild its empire. Ionia's Greek *poleis*, which had been the empire's largest group, were again, after a century, Persian subjects. The peace-treaty also stipulated that the other *poleis* must be autonomous. This meant that the Athenian *demos* could no longer force other states into dependent relations with them. Against any *poleis* that broke these terms, Artaxerxes promised that he would make war against them "both by land and sea, and with ships and money." Worse still he let Sparta use the autonomy clause as an excuse to attack other *poleis* or to ignore it altogether. In the face of this resurgent Sparta, Athens had to find new allies as a matter of urgency. It took the Athenian *demos* several years to work out just how to do this: they would invite other states, excepting Persia's subjects, to join a multilateral alliance which respected the King's Peace. This alliance is known as the Second

Athenian Confederacy (or Second Athenian League). Athens promised members that it would not interfere in their politics, nor make them pay *phoros* (IG II² 43). By 378, the Athenians judged that the Confederacy was large enough to resume full-scale war against Sparta.

In the fifth century, Athens had largely paid for its armed forces out of imperial income. But the King's Peace now ruled this option out. To fund this new war the Athenian *demos* needed to reform public finances. In 378, they changed how the tax for war on elite-property was collected. *Eisphora*-payers no longer paid individually. Instead, they were placed into groups and the wealthiest member of each paid for the whole group before collecting the tax from its other members. This reform helped to ensure that funds for an expedition were always on hand for its departure. For the same end the *demos* had, by 373, established a dedicated fund to pay for war. Any surplus of public income at the year's end was deposited into this *stratitika* or military fund (Demosthenes 1 [*First Olynthiac*] 19–20; 3 [*Third Olynthiac*] 11–13). In 373, Athens started asking Confederacy-members to make *suntaxeis* ("contributions") to their joint expeditions ([Demosthenes] 49 [*Against Timotheus*] 49). During the Athenian Empire the Athenians alone had complete control over the amount of *phoros* to be collected and how it was spent (e.g., IG I³ 71). These *suntaxeis* were quite different. The Second Athenian Confederacy had an independent council of its members. This council authorized the level of contribution which each *polis* paid and how the collected *suntaxeis* could be spent (IG II² 111). These contributions added up to around 60 talents per year (e.g., Aeschines 2 [*On the Embassy*] 71; Demosthenes 18 [*On the Crown*] 234).

In the 370s and the 360s, Athens spent on average 500 talents per year on its armed forces. In spite of its public-finance reforms this was a struggle. Athenian generals were regularly sent out with insufficient funds and so had to raise more during their campaigns. They met such shortfalls by, for example, drawing on the booty which they had captured (e.g., Diodorus 15.47.7), plundering the enemy's countryside (e.g., Isocrates 15 [*Antidosis*] 111–112), or forcing nonleague-member *poleis* and merchant ships nearby to pay protection money (e.g., Aeschines 2 [*On the Embassy*] 71–72). Importantly, however, they could not treat such funds as their own as the *imperatores* (commanders) of the Roman Republic would come to do. Instead such funds were judged to be public income. The Athenian *demos* authorized their collection and usage either before a *strategos* (general)

departed or during his expedition (e.g., Lysias 28 [*Against Ergocles*] 5–6). On his return, he submitted an account of what he had raised in the field and deposited any surplus to the state (e.g., Demosthenes 20 [*Against Leptines*] 71–80).

These different funding-sources enabled the Athenians to become a major military power. Consequently they were able to keep fighting Sparta successfully until the Thebans ended that state's hegemony of Greece at the battle of Leuctra in 371. For the next three decades Athens was able to keep its enemies well away from its territory and to launch the fleets which were required to protect its shipping-lines through the Dardanelles, which were vital for its grain-supply. It was once again recognized as Greece's leading sea power. In spite of this renewed military success, Athenian public finances were not strong enough to stop the rise of Philip II. In only 20 years Philip turned Macedonia into a major military power and then, with his victory at the battle of Chaeronea in 338, into Greece's new hegemon. Certainly this rise had a lot to do with Philip II's military innovations. He introduced an unrivalled training-program for the Macedonian army, and employed vast numbers of non-Macedonian hoplites, horsemen, and peltasts as mercenaries. By investing in siege-engines Philip II came to surpass Athens as a besieger of *poleis*. But what made this military pioneering possible was his careful building up of Macedonia's public finances. Phillip II fully exploited the mineral resources of his expanding state. When he captured, for example, Mount Pangaeum in 356, he massively expanded its gold-mines (Diodorus 16.8.6). This mining alone earned him 1,000 talents per year. As he incorporated new territories into Macedonia, he also broadened its tax-base by requiring their elites to pay *eisphorai* on their private property.

Philip's son, Alexander the Great, by contrast, grew less concerned about public finances as he conquered the Persian Empire; for plunder, he found, easily paid for his army (e.g., Diodorus 7.80.13). Initially the *diadochoi* (Successors) who, after Alexander III's death in 323, fought over his conquests, found the same. But in time they too had to manage their public finances more carefully. Thus the Ptolemies introduced a 10 percent tax on Egyptian agriculture. In Ionia and beyond, the Seleucids reintroduced the *phoros* of the Persians, while the Antigonids built on what Philip II had done in Macedonia. Such public-finance reforms enabled the Hellenistic kingdoms to raise significantly the scale of Greek warfare. At the battle of

Gaza, for example, in 217, the armies of Antiochus III and Ptolemy IV, which were mainly composed of mercenaries, totaled 140,000. This was several times more than the armies which Classical Athens and Sparta had ever been able to field against each other. War for the dominance in the ancient Greek world had now moved decisively beyond its *poleis*.

Fortifications

Fortifications—most of which can be termed city walls—constitute by far the largest single category of architecture among the ruins of the ancient Greek world. The countless remains of fortifications, dating from the early Iron Age until well into the Roman period, testify to the fact that Greek

settlements and territories had to be protected from aggressors and intruders, Greek as well as non-Greek. This is a fact and social circumstance throughout the history of ancient Greece. Warfare and its role in ancient Greek culture is well-known and much studied. Yet, while fortifications played a great role in developing our perceptions of the Mycenaean world (see illustrations in Mycenae and Tiryns entries), archaeologists and researchers after the early philhellenic travelers shifted their focus of interest in the directions of central urban topography and the architectural remains of fine religious architecture, especially temples. However, since the 1970s a number of comprehensive studies of ancient Greek fortifications have been published in English, and in the last 10 years fortification studies have taken off. This has been particularly true among scholars in central Europe, an example being the German based research network *Fokus Fortifikation* (www.fokusfortifikation.de).

As a result of this new wave of research, it has become clear that fortifications played a much greater role in a wider range of aspects of ancient Greek society than was previously imagined. They are not only a sign that the constant fear of attack was omnipresent for every individual city-state at all times: a fortification constituted normally the single most labor- and cost-intensive engineering project a city-state could undertake; its existence required a very high amount of social organization; and it had enormous repercussions for the way the city fitted into its topography. The role of fortifications was deeply embedded in the development of ancient Greek city-state culture, including on the political level, since fortifications ensured autonomy—complete or partial—for the people who erected them. Fortifications constituted a dynamic element in the ancient Greek culture, an element which matched the state of the art of warfare and responded to its changes. Fortifications are best understood when focus is kept on their function.

Part of the 6-mile-long walls of Messene, the best preserved fortifications in Greece. Messene was founded on the slopes of Mount Ithôme in 369, after the Thebans liberated Messenia (in the southwestern Peloponnese) from Spartan control. The walls were built soon afterwards, with regular ashlar masonry typical of the Classical Period. (Photo by Peter Londey)

During the many centuries before the Classical Period, fortifications were normally not constructed to withstand real sieges, exceptions being some cities with territories bordering great territorial kingdoms of the Near East. Examples are Old Smyrna, Miletus, and the other Greek cities in western Asia Minor, bordering the Lydians and later the Persians, and the Greek cities of the eastern, central and western Mediterranean, who would occasionally clash with the Phoenicians (see below). It was not until the rise of Sparta and Athens in the fifth century and Macedonia in the fourth that walls and fortification systems had to be designed to be potentially fit to withstand a siege from fellow (but hostile) Greeks. In the early Iron Age, the Archaic Period and the early part of the Classical Period, walls were built for the purpose of keeping settlements clear of unwanted animals, to guard against people like pirates and opportunistic enemies who might take advantage if the (citizen) army of the defending city lost a pitched battle in a plain near its city. No *polis*-army had the resources for sieges lasting for more than perhaps a few weeks at the most. Armies in these early times were raised by city-states and consisted of their citizens, who were bound professionally to the city they came from: they would be farmers, traders, or

craftsmen who would have business to attend to, and therefore were unlikely to be able or willing to be away from home for long periods. Conscript citizens were also unlikely to be willing to risk their lives in endeavors not directly linked to the safety or survival of their own city—expeditions against the territories of foreign city-states were simply rarely undertaken. The professional soldiers of the late Classical and Hellenistic Periods were different, and when enough of them could be bought for sufficient periods of time, fortified cities faced a much more substantial threat than ever before. Once raising such armies became standard practice for the great Hellenistic powers, from the time of the *diadochoi*, warfare changed radically, and remained that way until the Romans took over and the situation changed once again. Greek cities kept building fortifications, regardless of the fact that they might no longer be decisive in conflict, and every attempt possible was made to make things difficult for potential besiegers. Besides, the other threats and occasional inconveniences of the ancient world were still as present in the Hellenistic Period as they had been earlier: wild animals and pirates would have to be kept out of the settlement/town, and domesticated animals and people with peaceful errands would have to be controlled, which meant either kept out altogether or allowed access through controllable gates or posterns.

Fourth-century fortification walls at Eleutherae, an Athenian fortress on the border with Boeotia. The small town of Eleutherae had originally been Boeotian, but

became part of Attica in the sixth century. The fortress, one of a string of border fortifications that the Athenians built or refurbished in the fourth century, had a 2800-foot circuit wall, with a number of towers, several of which can be seen here. (Photo by Peter Londey)

Early Greek Fortifications

Sometimes Early Iron Age settlements were located within the ruined (but still functional) walls of Mycenaean fortified hill tops; in other cases, settlements located where no major structures from previous cultures existed built their own new walls. It has been the general view until recently that most settlements, not only of the Early Iron Age but also of the Archaic Period, were unfortified. This view is currently being revised, and more and more scholars now take the view that fortifications were a completely integrated element of settlement in the ancient Greek world, from the Early Iron Age down to the Roman period.

Famous examples from the early Iron Age include Old Smyrna in Ionia, Emporion in Chios, and Zagora in Andros. These sites and their fortifications are very different from each other, but seem to reflect basic types of fortification chosen by a number of settlements of the Early Iron Age Greek world. By 800, Smyrna was already a town of perhaps 5,000 inhabitants, and the core of the town was surrounded by a huge fortification, a mud brick wall on a stone socle. As early as the late ninth century, the Smyrna wall (Smyrna 1) had a monumental gate partly consisting of cut stonework of different types of stone, gray and white, and the late seventh century wall (Smyrna 3) was some 18 meters wide. Emporion, a settlement abandoned ca. 800, was a quite different case, as the hill-top fortification was devoid of houses, apart from a building which seems to have been a ruler's dwelling or a temple. The inhabitants simply lived in houses on the slopes of the hill, outside the fortification, which was then in fact a refuge. Zagora in Andros, a settlement abandoned in the early seventh century, was located on a promontory, the upper plateau of which was cut off from the main island with a wall running across the neck of the peninsula. In this case, the wall did not encompass the settlement, but protected the only easily accessible side of the settlement. On the other three sides, steep cliffs made access if not impossible, then at least very difficult.

During the seventh and sixth centuries the Greek world (the homeland—

more or less equivalent to present day Greece—as well as the colonies in Ionia and the other regions of the Asia Minor coast, Sicily and South Italy, in the Black Sea area, and the Cyrenaica in North Africa) saw hundreds of proper towns and cities developing, and evidence points in the direction of their having normally been fortified. As settlements got larger, so did fortifications, both in the areas they encompassed, and in terms of solidity and architectural and structural complexity. A wall had to have a certain height to fulfill its purpose, and it seems that in the Archaic Period walls were often some 6 meters high on the inside and 8 meters toward the outside, including the battlement. The battlement was an extra wall running around the external upper edge of the fortification to protect defenders. Walls also needed to have a certain width, both to be structurally stable and to ensure that the defending soldiers on the wall could walk on the top, with enough space to maneuver and pass each other, in armor and carrying weapons, tools or building material. A fortification wall would have a number of gates, to ensure that the people living inside the wall could exit and enter the settlement. A gate always constitutes a weak point in a fortification, a fact which would push architects to design walls with as small a number of gates as possible. With larger settlements it is clear that it would be very impractical with only one or say two openings toward the world around. More gates would allow people shorter routes to where they needed to go in peace time. Getting the balance right here, installing exactly enough but not too many gates, was crucial for functionality and security. Posterns—small openings allowing for pedestrians and animals to enter and exit a fortification—on desired spots where a gate was perhaps not necessary, or deemed too dangerous to install, would partially aid traffic flow, while constituting only minor security issues; posterns are found in walls from the Archaic Period onward. Towers are present from the time of the earliest walls, first of all at weak points, such as gates. Towers differ from bastions in being taller than the wall itself. Bastions are often simply extensions in the width of the wall at weak spots. A tower served the purpose of providing a higher firing angle than could be had from the top of the wall, enabling crossfire along the front of the wall, and providing the defenders with a number of elevated positions overlooking as much of the surrounding territory as possible. Individual towers appear with fortification walls from very early on, and systems of towers occurring at certain intervals along the whole line of a wall are known from the later

sixth century (Megara Hyblaea in Sicily), but do not seem to be a widespread phenomenon before the Classical Period. Outworks—additional structures placed in front of the wall to present enemies with further obstacles than just the wall itself, the so-called *proteichismata*—appear from very early on as well. The ditch is the most common outwork in the Archaic Period, attested in most examples from the sixth century. Fortifications were, from early on, huge undertakings for the communities that erected them, and cities therefore in the process of construction sought as many pragmatic ways to save time and money as possible. Thus it was often the case that a great part of the building material used for the wall was extracted from what was later to become the ditch in front of it, and so two fortification structures were created by one flow of work.

Classical Fortifications

By the Classical Period, fortifications had already played an important role for the architectural and topographical planning of the Greek city-states for centuries. In the fifth century, fortifications were mainly constructed as in the Archaic Period, that is, of mud brick on a socle of more or less finely dressed stone, whereas in the fourth century walls built entirely in stone became more and more frequent. A new category of fortification is siege walls, which we learn about first of all in connection with the Second Peloponnesian War. A siege wall encircled an entire besieged town, concentric to its walls, as in the case of the Spartan double wall with towers around the Boeotian *polis* of Plataea in 429–427. The purpose here was clear: the wall prevented the besieged from having any contact with the outside world and it protected the besiegers from assaults from the besieged. This siege ended successfully for the besiegers, as the Plataeans were eventually starved into giving up. Another example is the Athenian blockading wall at Syracuse in Sicily in 414, built for the purpose of cutting the city off from the rest of Sicily. This siege ended catastrophically for Athens in 413. Such siege walls constitute a truly extraordinary phenomenon, which shows the efficiency of fortification at the time but also shows the determination of some powerful states in their attempt to expand or preserve their power. This use of a defensive tool against a defensive tool would allow the aggressor to put great pressure on the besieged enemy avoiding a direct assault on the walls of the besieged city and thus minimizing the loss of lives for the besiegers. Another novelty of the fifth century was the so-called

long walls, which physically connected a fortified inland urban center with a fortified harbor, ensuring the city in question safe and fortified access to the sea in the case of a regular siege or the presence of enemy troops in its territory. The best known example is the Long Walls of Athens, but written and archaeological evidence attest to the existence of comparable walls also at Argos, Corinth, Megara, and Patrae.

Until a wall was installed in the Hellenistic Period, Sparta was the outstanding example of a *polis* that was not walled. In Archaic and Classical times, Sparta had one of the strongest armies in Greece, an army which could move anywhere quite quickly in the huge Lacedaemonian territory, and the Spartans may have seen it as a sign of weakness if they, like everybody else, had walls to fall back on if they lost a battle at a distance from their city (QQ 6, and introduction to QQ).

The fourth century saw important developments in defensive technology, as logical responses to the steady advances in the sophistication and frequency of siege warfare. The Carthaginian campaign in Sicily in the late fifth century had brought the combination of battering ram, mobile siege towers, and catapults into successful use against the Greek *poleis* of the island. The development of fortifications in the Greek world soon tried to catch up with this new threat. The race took off with great speed for real in the second half of the fourth century, when Alexander and his Successors were able to assemble resources—for the first time in the history of the Greek world—to build such machines and enable their proper handling, while also employing large numbers of mercenary troops of various sorts. Machinery, which seems to have been developed first of all by offensive military engineers, was now becoming part of the standard equipment of fortifications, at least in major cities. Artillery such as catapults were installed in towers, sometimes on more than one level, and such installations of course had repercussions on the architecture: the floor of each storey had to be strong enough to carry such machines and their munitions, and had to be designed so that the machines could shoot from the optimal height and angle, be operated properly, and so on.

Hellenistic Fortifications

City walls of the Hellenistic Period were generally higher and stronger than walls of earlier periods. They were mostly built entirely of stone apart from the center, which was normally a fill of earth and rubble. The overall agenda

for the defense of settlements of this period was to prevent siege machines from approaching anywhere near the wall. If that happened, the fight was lost. This new concern can be clearly observed in cities constructed, or refounded, in the period between Alexander the Great and the Roman conquest of Greece in 146. A key defensive tool from the earliest times, the location of a city on a high position to make attacks difficult, was becoming even more common in this golden age of siege machinery. But as cities of the period were often too large to fit on a hill top, large areas consisting of a central hill, and lesser hills as well as the plain territory in between, were often incorporated in fortifications, and the wall would run along high ridges and hilltops, so as to make approaches with machines as difficult as possible. Examples of relocations for the strategic military reasons just explained are Pleuron in Aetolia and Sicyon in Achaea. Both cities were relocated from low hills to much higher lying plateaus in the late fourth and third centuries, where new state-of-the-art fortifications were constructed in interplay with the local topography to make the cities unconquerable. In both of the cases just mentioned, the perimeter wall ran along the ridge of the plateau occupied by the relocated city, so that any attackers who wanted to bring siege engines close to the walls would have to build artificial ramps of such an immense size that it would probably never be attempted. Hellenistic cities that chose to have parts of their fortified perimeters exposed directly toward a plain would need to construct extensive outworks, a phenomenon known all the way back from the Archaic Period, as explained above. Most important here was a wide and deep ditch, or several ditches, not directly in front of the wall, but some 20 meters away from it, and one or more smaller walls and palisades. These would prevent an army, with or without siege engines, from coming anywhere near the principal wall, until after it had managed to pass the first obstacles. This alone would have been no easy task, since the defenders would ensure a constant fire of stones, arrows, and lead bullets from defense engines, archers, and hand held slings.

France and Spain, Greek Cities in. See Colonies, Colonization

Freedom (*Eleutheria*)

In ancient Greek society, the fundamental division was between free persons and slaves. The same language and concepts applied to individual status, *eleutheria* (freedom) and *douleia* (slavery), were also used metaphorically for interstate relations. Thus in 431, Sparta declared that it was going to war for the freedom (*eleutheria*) of the Greeks (Thucydides 2.8), meaning in practice to overthrow the Athenian Empire. Athens was often said to have enslaved Greek cities, either in general by being an imperial power or in particular cases of allies subjugated after attempting to defect (Thucydides 1.98, 124). At the end of the Second Peloponnesian War (404), there was a short-lived expectation that the end of the Athenian Empire meant the beginning of freedom for the Greeks (Xenophon, *Hellenica* 2.2.23).

Freedom of states from any external control was an aspiration difficult to attain in the real world. Leading states professed to respect the freedom of the Greeks and did not admit that their own dominance limited it. The freedom of the Greeks was a slogan taken up by Macedonian warlords in 311 (Diodorus 19.105) and by kings such as Antigonos I Monophthalmus and Demetrius II Poliorcetes in 302 (20.102), to further their own aims.

In diplomatic language, freedom (*eleutheria*), being free from external control, was often combined with autonomy (*autonomia*, the status of living under laws of one's own choosing). The practical difference between these terms was slight but both remained part of the vocabulary of Greek interstate relations and an aspiration that could always inspire hope.

Frontinus (ca. 35–103/4 CE)

Frontinus (full name: Sextus Iulius Frontinus) was a high-ranking Roman official (consul in 72 or 73, 98, and 100 CE), who had commanded in war against the Silures (in present-day Wales). He wrote a (lost) military treatise that he claimed was the only systematic treatment of the subject. Such claims are not to be taken too literally. He followed this with the *Strategemata* in four books, intended to illustrate his doctrines by a collection of examples. The authenticity of the Book 4 has been inconclusively contested. The work is methodically organized by subject matter and shows some common sense. When other sources survive, Frontinus occasionally adds a useful detail. Faulty abbreviation on Frontinus' part is at times observable when other sources are available.

G

Gabiene, Battle of (316)

Fought northwest of Persepolis between Eumenes of Cardia and Antigonus I Monophthalmus, Gabiene reversed the result of Paraetacene. Antigonus placed his phalanx in the center, cavalry on the wings, and elephants and light infantry in front of the whole line. His army was around 10,000 light infantry, 22,000 heavy infantry, and 9,000 cavalry. Eumenes stationed his best cavalry on his left opposite Antigonus' better cavalry, with the elephants *en echelon* as a left flank guard. His phalanx was in the center and his weaker cavalry and remaining elephants on the right. He had about 37,000 infantry and 6,000 cavalry. The number of elephants recorded in Diodorus is the same as at Paraetacene and therefore questionable. Eumenes intended to hold back his weak right wing until the battle was decided elsewhere. Antigonus intended to overwhelm Eumenes' elite left wing.

The elephants and cavalry engaged on Eumenes' left wing. Antigonus then personally led a second wave of cavalry into the melee. Eumenes' flank guard of elephants entered one at a time, neutralizing their numerical superiority. Meanwhile Antigonus sent a detachment, hidden by dust clouds, to capture Eumenes' camp. Peucestas, one of Eumenes' commanders, fled with a third of Eumenes' cavalry. Eumenes moved his remaining cavalry to the other wing to join his reserve troops. In the center, Eumenes' phalanx routed Antigonus'. Eumenes tried to rally Peucestas' cavalry but they refused, so he withdrew.

Although the battle was arguably a draw, Eumenes' veterans of the phalanx agreed to surrender him to Antigonus in return for their captured baggage and families. Antigonus subsequently executed Eumenes, despite admiring his generalship.

Galatians

A Celtic people who also gave their name to the region they settled, between Phrygia and Cappadocia in central northern Anatolia (modern Turkey). The Galatians had crossed over into Asia Minor from Thrace as the culmination of the extensive Celtic migrations across Europe and the Balkans during the sixth to the third centuries.

After menacing Macedon and northern Greece in 281, the Galatians were defeated by Antigonus II Gonatas and then crossed the Hellespont in 278 at the invitation of Nicomedes I of Bithynia, who required their assistance with a dynastic struggle. In 275, they were defeated by Antiochus I, but continued to menace and raid neighboring Greek cities until they were checked by Attalus I of Pergamum, giving rise to the famous artistic trope of the Dying Gaul. They proved to be a ready source of unreliable mercenaries, until they were subdued by the Romans after the battle of Magnesia in 190; they remained surprisingly faithful to Rome during the Mithridatic Wars.

Garrisons

Most Greeks despised the professional generally and thus the professional soldier and especially standing armies in a permanent state of military preparation. Garrisons (*phrouroi*) required professional and long-standing soldiers that ran contrary to this Greek amateur ideal. In addition, garrisons were often associated with tyrannies either protecting the tyrant from the people through the use of professional outsiders—mercenaries—as much as protecting the state from outside attack. Needless to say, garrisons were also associable with foreign occupation and control.

Early Greek tyrants relied on hired troops to maintain their power within Greek states. These troops formed a permanent garrison under arms within the tyrant's community. The Persians had also used garrisons to control the cities within their empire. Thus, many of the Greek cities of the Anatolian coastline had direct experience of Persian garrison forces.

Despite Greek hostility to the idea of permanent garrisons, as the Classical Period progressed they became essential in defense of frontiers or strategic locations within *poleis*. Athens regularly sent out garrisons in the form of military settlers—styled *klerouchoi*—after the subordination of a revolt from the Delian League in the fifth century. The Spartans garrisoned Decelea in Attica in the final decade of the Second Peloponnesian War, causing the Athenians no end of problems all year round. The Spartans also dominated their briefly held Aegean Empire with the use of governors (*harmostai*) supported by garrisons on the islands of the Aegean and they garrisoned even more briefly the city of Athens itself from 404 to 403. By the fourth century garrison troops became increasingly common. The Athenians beefed up their frontier defenses and garrison troops often made up of the younger Athenian soldiers served in the frontier forts as part of what was to become the *ephebeia*, a two-year period of military training and service to the Athenian state undertaken by the wealthier Athenian hoplites.

Hand-in-glove with the more common use of garrisons went the increasing employment of mercenary soldiers in the latter fifth and fourth centuries. Thucydides refers to several garrisons of Peloponnesian troops in

the cities of Asia Minor held by Persian satraps and governors. Mercenaries like those Peloponnesians regularly formed garrison units, their professional status enabling all year round service and sedentary employment away from their homes. In the mid-fourth century Aeneas Tacticus wrote a treatise, *Poliorketika* (*Siegecraft*). In this work, he describes the use of mercenaries as part of the defensive forces of any city, effectively a professional garrison within the community. Noteworthy are his constant warnings regarding their potential disloyalty and the dangers they posed for their employers in fomenting coups or changing sides.

Garrison troops played a central role in Alexander's conquest of the East. They held down local populations, exacted tribute, and prevented native revolts. Many garrisons appeared as part of Alexander's new city foundations, especially across Bactria and northern India, thus making them appear as much like military colonies as garrisons *per se*. Garrisons were even more significant in maintaining monarchic control under Alexander's successor kings. We are blessed with good information about Hellenistic military garrisons across these new kingdoms.

Epigraphic evidence shows the relationship that garrisons had to the kings themselves as their employers. *OGIS* 1.266 illustrates that these were professional soldiers paid in coin and in kind. They served for set periods of time in settled positions often separate from the cities of the king's realm. They enjoyed rights of marriage and parenthood and their children were protected in the event of their deaths. The Seleucid monarchy which dominated western Asia in the wake of Alexander's conquests benefitted from a very successful system of military settlements—styled *katoikiai*—in which active military servicemen settled in communities that replenished themselves and thus the armies of the Seleucid monarch. In Egypt, Ptolemy more commonly settled servicemen in retirement on individual plots that made communal military replenishment less likely, though Ptolemy like all the successor monarchs employed garrisons in his frontier fortresses and at strategic locations within the country.

In Greece proper, Philip V established garrisons at Corinth, Chalcis, and Demetrias—the so-called Fetters of Greece. These were central to his control of Greece and illustrate the effectiveness of well-placed and loyal garrisons in dominating a region.

Gaugamela, Battle of (331)

The third battle in Alexander the Great's conquest of the Persian Empire, which led to the death of Darius and the capture of Persia proper. The battle occurred in northeastern Mesopotamia (modern Iraq) on October 1, 331 and is sometimes known as Arbela, after the closest town. The extant ancient sources record unbelievable Persian numbers, with the highest being 1 million infantry and 400,000 cavalry. Whatever the numbers, it is clear that the Persians considerably outnumbered Alexander. Darius III commanded the Persian army and chose the plain of Gaugamela because it was suitable for his cavalry and chariots and, unlike Issus, had plenty of maneuver-room. When Alexander arrived, he set up a fortified camp and rested his army. The Persians, fearing a night attack, spent much of the night awake and deployed the next day tired and with low morale. Leaving his baggage behind inside the camp, Alexander conducted a careful battlefield reconnaissance before deploying his troops.

Darius was in the center, with the 2,000–4,000 Greek mercenary infantry—his best foot soldiers—and 50 scythed chariots. Another 100 scythed chariots were posted on the left wing with his best cavalry. To his right were the local Mesopotamian and Syrian troops, with another 50 scythed chariots and cavalry on the extreme right.

Alexander's main threat was having his army of 40,000 infantry and 7,000 cavalry surrounded in the open plain by the superior numbers of Persian cavalry and chariots. He posted a reserve infantry force to protect his rear and light infantry and archers on the flanks to link this with his front line. His main line was, from left to right, allied Greek cavalry, the Macedonian phalanx, the hypaspists, and, under his personal command, the

Companion cavalry. He also tasked javelin troops to target the Persian chariot drivers and horses.

In the prebattle jockeying for position, Alexander kept pushing his right wing further to the right to prevent the Persians encircling him. When this reached uneven ground on which the Persians could not use their chariots the Persians had to attack. Alexander's javelin troops destroyed most of the Persian chariots and, as ordered, the main line opened up so the few chariots that survived the javelins could pass harmlessly through. Despite exerting dangerous pressure on the Greek cavalry on Alexander's left wing, the Persians gave Alexander an opening when a gap emerged in their line. Alexander seized the fleeting opportunity, formed a wedge of his cavalry and the closest part of the phalanx and charged through the gap and straight at Darius. The Macedonians had the advantage in hand-to-hand combat with their longer infantry and cavalry spears (respectively, *sarissae* and *xysta*) and Darius fled. The Macedonian left wing was in severe difficulty—Persian and Indian cavalry had managed to break through to the baggage animals in the rear—until the reserve force carried out its orders and steadied the situation. The battle ended when Alexander called off his pursuit of Darius to aid the left wing.

Alexander's victory at Gaugamela effectively ended organized Persian resistance. Although Darius escaped, he was soon murdered by Bessus, the satrap of Bactria.

Gelon (Ruled ca. 491–478)

Gelon was the son of Deinomenes, and a member of a prominent family at Gela. He served with distinction in the campaigns of the Geloan tyrant Hippocrates and was given command of the cavalry. Upon the death of Hippocrates ca. 491, Gelon seized power, nominally for Hippocrates' heirs, but as soon as he had defeated the citizen army of Gela, he claimed power for himself.

Gelon's reign from ca. 491 to 485 was peaceful; he was clever enough to realize that the Geloans, exhausted by Hippocrates' almost incessant wars, needed peace and stability. In 485, the exiled oligarchic faction from Syracuse appealed to Gelon for help. Gelon easily overthrew the new Syracusan democracy and took control of that city. Gelon immediately settled in Syracuse, where he also resettled many of the Geloans, leaving his brother Hieron to govern Gela on his behalf. Camarina, which had been captured during the tyranny of Hippocrates, was now destroyed and its population resettled in Syracuse. In 483, Gelon fought a successful war against Megara Hyblaea and destroyed the city.

By 480, Gelon is alleged to have possessed 200 warships, 20,000 hoplites, control over half of Sicily, and the firm alliance of Theron the tyrant of Acragas. Theron's expulsion of their mutual enemy Terillus of Himera brought about war with Carthage. The largest Carthaginian force yet seen in Sicily, under the command of Hamilcar, made camp near Himera. Gelon marched out to meet it and inflicted a crushing defeat on the Carthaginians and ended the war in this single engagement. When Gelon died in 478, his resounding victory over the Carthaginians and the relative peace and prosperity he brought to Syracuse were still fresh in the collective memory and his reign was seen as successful. He was succeeded by his brother Hieron.

Gender in War

“Gender” is a key concept in feminist scholarship that aims to recover the lived experience of women in antiquity and, more ambitiously, to reconstruct the past without the male-centered assumptions, often summed up with the label “patriarchy,” embedded in the dominant culture of the past and still problematic in the culture of the present.

Ancient Greek societies rested upon the concept of the citizen as free male embodying certain qualities appropriate to masculinity, such as *arête* (roughly, “courage”). “Woman” in the abstract was seen as an incomplete and inferior form of maleness. That women bore and raised children, did housework, were subject to domestic violence and so on was not a subject of political debate, though reimaginings of the role of women could occur in Athenian comedy (Aristophanes, *Lysistrata*, *Thesmophoriae*, *Ecclesiazusae*) or philosophical speculation (Plato, *Republic* 5.452–456, *Laws* 7.813–814; 8.829–830).

That women suffered starvation in war, or death, enslavement and rape (the last two most evidently in a captured city) is self-evident, even if only sketchily attested by specific evidence. What is missing is the evidence of women’s “voices” (a virtual technical term) telling us about their experience. Very little women’s writing survives from antiquity. In a scrap of Sappho’s poetry (ca. 650–600), things of beauty second but inferior to love are an army of infantry or cavalry and warships (Fragment 16.1–2, trans. M. L. West). What to make of this?

Feminist scholarship has made only limited headway to date with the subject of war. For obvious reasons it concentrates on subjects such as domestic life or sexuality, even if the relevant texts were almost all written by men. The feminist analytical tool of “reading against the grain” may tease out hidden insights into women’s feelings in these areas, but it is still to be seen what such readings might do with Thucydides, Xenophon, or Polybius’ war histories.

In the works referred to above the philosopher Plato imagined that elite women (*Republic*) or selected citizen women (*Laws*) in the ideal states he constructed might have a role in warfare. The experiment was never actually tried anywhere. Rare examples of women as military leaders, usually from foreign, monarchic societies did not occasion any rethinking: neither Artemisia at Salamis (480), nor (a less familiar example) the

formidable Mania in the Troad (ca. 400). Etiquette required that she watch her Greek mercenaries in action from a distance in her carriage (Xenophon, *Hellenica* 3.1.13).

Women were ever present in Greek warfare, if largely unnoticed. A few incidental allusions in Xenophon's *Anabasis* (4.1.14, 3.19, 30; 5.3.1, 4.33; 6.1.12) reveal that women, including prostitutes, accompanied the "Ten Thousand" Greek mercenaries on the march into Mesopotamia and back to the Black Sea (401–399). Recovering or reconstructing the experience of these and other women in war is a work not yet in progress.

Gods of War

The most well-known god of war is the Olympian, Ares, son of Zeus and Hera and the erstwhile companion of Aphrodite. Hesiod describes him in the company of *Phobos* (Fear) and *Deimos* (Terror) on the battlefield. In Aeschylus' *Seven Against Thebes*, the army swears a blood-oath on the eve of battle in which the heroes catch the blood of a sacrificed bull in a shield. With bloodied hands they jointly swear in Ares' name.

Ares was dreaded rather than loved. Zeus, in Homer's *Iliad*, says to him: "you are the most hateful to me of all the gods ... strife is always dear to you and wars and slaughter" (5.890–893). Even Ares' children were loathed, such

as the bandit, Cynos, who built a temple out of human skulls, and the hideous serpent, which fought Cadmus, the father of Thebes. Consequently, temples and monuments dedicated to Ares were uncommon in the Greek world. But despite his bad press, armies before battle usually sought Ares' favor. According to Plutarch, Spartans regularly sacrificed dogs to him under his title *Enyalios*. His role may not have been popular and other gods would have been asked to fight alongside them, but Ares' power as the main deity of the battlefield was clear. He was the preeminent Greek god of war, who could not be ignored if the army was to be successful in battle.

There were other gods, heroes and deities associated with war. In Athens, the temple of Athena *Nike* (Victory) on the Acropolis is a clear example, as are the warlike epithets of *Areios* and *Areia*, which were applied to a number of gods in other states.

Minor deities and heroes also had roles in the wars of different *poleis*. An inscribed *stele* from Selinus of the late fifth century specifically attributes victory in a battle to the benevolence of a number of gods. At the time of the battle of Marathon (490), Pausanias tells us that it was widely believed that the goat-god, Pan, Theseus, and a chthonic hero that an oracle identified as Echelaeus participated directly in the battle. Ajax, Telamon, and other heroes were invoked because of an earthquake at Salamis just before the battle (Herodotus 8.64). Herodotus' Themistocles specifically attributed victory in the Persian Wars to "the gods and heroes." Herodotus (8.65) also tells us that before Salamis a mysterious ghostly cloud of dust arose at Eleusis from which could be heard the chant of "Iacchus" associated with the Mysteries and notes (9.65) that no Persian died upon land sacred to Demeter at Plataea, because the goddess had not permitted them entry, as she was outraged by the desecration of her sanctuary.

Gods were also active in the carnage during and after the battle. Some believed that the dreaded twins, *Thanatos* (Death) and *Hypnos* (Sleep) would collect the souls of the dead. Sparta also recognized a special place in war for the Dioscuri (Castor and Pollux). Plutarch says that these twins appeared alongside Lysander at Aegospotami. They are credited with inventing the war dances of Sparta, and their duality even reflects the Spartan diarchy itself: the Dioscuri were both invoked when both Spartan kings marched into battle, but just one was invoked if only one of the kings set out.

However, not all Greeks believed in the power of these deities. Plato's

Socrates argued that it is ridiculous to believe that gods, as perfect beings, would change their shapes into “corrupt” mortal forms. But Socrates’ religious views were, in part, responsible for his execution after a trial in which he was found guilty of impiety. It is probably safer to assume that the general population revered the gods and believed that their support was required to deliver success in war.

Granicus, Battle of (334)

The first battle in Alexander the Great’s conquest of the Persian Empire, fought in May 334 between Alexander’s Macedonian-Greek army and the Persian-Greek army of western Asia Minor. The Macedonian army was around 47,000 strong while the Persian army had 20,000 cavalry and about 20,000 Greek mercenary infantry. The Persian defeat removed the main obstacle to Alexander’s control of western Asia Minor and opened the rest of the Persian Empire to his attack.

The Persians had taken up a defensive position on the opposite riverbank, forcing Alexander to attempt an opposed river crossing. Arrian gives the best description of the battle and Diodorus’ version (that Alexander crossed unopposed) should be rejected. The Persians adopted the reverse of the normal tactics, posting their entire cavalry along the riverbank with the infantry behind them. Alexander led with his cavalry but with one brigade of infantry in close support. The main infantry force followed at an oblique angle across the river so that they would not be

forced to engage the Persians on an extended front. Alexander used his cavalry to dislodge the Persian horse from the bank and create a foothold for the infantry and Arrian (1.15.4–5) describes the start of the battle as “a cavalry struggle, though on infantry lines.” Parmenion is recorded as offering a more cautious approach than a head on attack, but from Arrian’s description Alexander’s tactics seem to have been well-calculated to avoid the risk—and the boldness of the attack may have been intended to throw the Persians off-balance.

Gylippus (d. after 403)

Gylippus was a Spartiate who in 414 was sent by Sparta to take command at Syracuse, then under siege by the Athenians. Gylippus collected reinforcements in the north of Sicily and brought them to Syracuse. The Athenian commander Nicias gravely underestimated the consequences of Gylippus’ arrival. He brought his forces into Syracuse just as it had been close to surrendering.

Gylippus reanimated the defense, aiming to cut off the Athenians’ uncompleted line of circumvallation to the north by driving out a cross-wall. He kept up morale after defeats and exploited his superiority in cavalry and light-armed troops. Gylippus also repeatedly drew in reinforcements from Sicily to counter Athenian numerical strength.

At some cost, Gylippus turned the Athenians’ north flank. Now holding the initiative, Gylippus urged the Syracusans to contest command of the

Great Harbor. After initial setbacks, their fleet neutralized Athenian sea power and blockaded the harbor entrance. In a full-scale naval battle in the harbor the Athenians were heavily defeated and made their disastrous attempt to retreat by land (413).

Gylippus also had to deal with the sensitivities of his allies, with whom tensions were inevitable. His success at Syracuse led only to a subordinate command in the last year of the Peloponnesian War, and the historian Thucydides did not markedly praise him, although he made plain the contrast between his effectiveness and Nicias' dilatoriness. The only other thing known about Gylippus is his exile for embezzling some of the money sent to Sparta by Lysander at the end of the Second Peloponnesian War. Sparta offered only limited opportunity for an ordinary citizen of such ability.

H

Haliartus, Battle of (395)

Haliartus, a small Boeotian city, northwest of Thebes, was the site of the first battle in the Corinthian War (395–387/6). Sparta planned to strike after the main Peloponnesian League army under King Pausanias and troops raised by Lysander from Phocis and other friendly areas met near Haliartus. However, Lysander arrived before Pausanias and after failing to detach Haliartus from the Boeotian League, attacked the city. Surprised by Theban reinforcements, Lysander was killed and his army broken. Complete disaster was averted when the hoplites managed to re-form, counter-attacked, and killed 200 Thebans (300 according to Plutarch). Xenophon (a contemporary with good links to Sparta) suggests Lysander acted hastily because he could not bear inaction. Plutarch (a late source, but perhaps preserving local Boeotian tradition) records that the Thebans intercepted a letter from Lysander to Pausanias with the meeting date and deliberately ambushed him. The two accounts are not incompatible and it seems clear that Lysander was over-confident in attacking alone.

Pausanias arrived the next day but decided not to fight. His decision was probably influenced by doubts about his allies, Athenian reinforcement of the enemy, and the impossibility of recovering the allied dead next to the city walls without first capturing the city. He agreed to withdraw under truce in return for the bodies of Lysander and his men. This victory provided impetus to the anti-Spartan coalition. Pausanias was put on trial at Sparta but fled to Tegea.

Halicarnassus

Halicarnassus (modern Bodrum) was a heavily fortified *polis* of Dorian origin, but very likely with a mixed Greek and non-Greek population, located in southwestern Caria. Famous later as the location of the renowned Mausoleum, the tomb of Mausolus of Caria, and the seat of the Hecatomnid dynasty from Mausolus on, it had earlier been home both to the warrior-queen Artemisia, who aided Xerxes against Greece in 480, and to the historian Herodotus, who recorded the conflict. In the fourth century, Mausolus extended Halicarnassus by merging it with a number of local communities, and moved his capital there from its traditional location at Mylasa. Halicarnassus was supposed to have been attacked by Rhodes, and defended by its queen Artemisia. Allowing the Rhodian force inside the walls, the story went, she trapped them by towing their abandoned fleet from the harbor, before killing the stranded troops.

In 334, Alexander the Great besieged Halicarnassus. After having driven the Persian garrison behind the walls, he began to fill in the city's defensive ditches and bring up siege weapons, repelling a nocturnal attack from the defenders. After the Macedonians were victorious in a further encounter outside the gates, the Persians decided to burn Halicarnassus and retreat. Alexander captured the city, killing those found engaged in arson, while freeing the rest. He razed the town and returned it to the Hecatomnid queen Ada, along with a small garrison.

After Alexander's death, Halicarnassus came under Ptolemaic power, is noted by Livy as a free ally of Ptolemy IV Philopator in 197, and a free city under the power of Rome after the Battle of Magnesia in 190.

Hamippoi (sing. *Hamippos*)

Light infantry operating with cavalry. *Hamippoi* are attested in Sicily from ca. 480 and in a Boeotian force in 419/18. In Athens, *hamippoi* were used in the 360s and seem to have replaced the *hippotoxotai* (horse archers) as a formal adjunct to the cavalry corps around the middle of the fourth century. *Hamippoi* could be used to strengthen cavalry in defense, for example, acting as a rearguard or staging ambushes (Xenophon describes how to hide them behind cavalry). However, the most evidence is for their use to stiffen cavalry in an attack—generally on other cavalry.

Harpalus (d. 323)

Harpalus, son of Machatas, a Macedonian noble, was one of Alexander the

Great's companions. He was one of the group of Alexander's friends exiled by Philip II in 337. The exiles were recalled on Philip's death and as Harpalus was unfit to serve in the army Alexander appointed him the army treasurer. Harpalus deserted in 333, just before the battle of Issus. Alexander pardoned Harpalus and reinstated him to his post and, in 331, put him in charge of the imperial treasury at Babylon.

However, in 324, just before Alexander returned from India, Harpalus again deserted, taking with him 6,000 mercenaries, 30 triremes and 5,000 talents. Harpalus seems to have fled from fear of punishment over his lavish extravagance and maladministration. Harpalus fled to Taenarum and, leaving his troops there, went to Athens. There, in a notoriously obscure sequence of events, he offered money and troops to support a revolt against Alexander. Demosthenes initially opposed this but was brought around, reportedly because he was bribed. However, the Athenians then arrested Harpalus and convicted Demosthenes of misappropriation. Harpalus escaped and fled to Crete where members of his own entourage murdered him.

Hegemon, Hegemonia

Hegemon is the Greek word for leader and *hegemonia* for leadership or hegemony. These terms were commonly applied to the dominant state in an alliance, since that state not only had control of directing the alliance's policy but also had command of its forces in the field. Thus Sparta held the

hegemony of the Hellenic League opposing the Persian invasion (480–479) and, on a much wider scale and over a much longer time, of the Peloponnesian League. It could also be said that in practical terms Athens held the *hegemonia* in the Second Athenian confederacy, although this actual term seems not to have been used in the treaties setting up this alliance. In two clear-cut cases, Philip II of Macedon was elected as hegemon of the Hellenic League that met in Corinth in 338/7, and the same body elected Alexander the Great to the same position in 336/5.

The authority of the hegemonial state was formally expressed by the terms of the treaty of alliance between it and its allies. However, its superior power and prestige counted for much more in practice. Modern historians have used hegemony as a conventional label for defining certain periods of Greek history when a particular state at the head of an alliance dominated the Greek cities: the Spartan hegemony (404–371), Theban (or Boeotian) hegemony (371–362 or 356). The practical differences between hegemony and empire in Greek history are not always apparent. It is only a matter of common usage that we hear of an Athenian Empire and not an Athenian hegemony. In the Hellenistic Period, a king could still be referred to as the *hegemon* of an alliance.

When an alliance was formed between states more or less equal in power, arrangements had to be negotiated for the *hegemonia* in the sense of the command of the alliance's forces in the field. For example, when Athens and Sparta formed a new alliance in 369 they had to settle this matter. The initial proposal was for Athens to hold the command at sea and Sparta on land. However, the Athenian assembly was persuaded that the *hegemonia* on land and sea should be held on land or sea by either state in turn for five days at a time (Xenophon, *Hellenica* 7.1.1–14).

Hellenic League (against Persians)

In 480-479, the Greeks defeated an invasion by the forces of the Persian Empire, and by doing so ensured that the states of mainland Greece did not fall under Persian control. Success was made possible because of an alliance known to modern scholars as the “Hellenic League,” bound by oaths taken in 481, in early summer of 480, and possibly again before the battle of Plataea in 479. This was a rare alliance, though only a minority of Greek states joined. The members of the Hellenic League successfully expelled the Persians, but in less than 20 years following that achievement fell into disrepair when the two most powerful members, Athens and Sparta, officially broke alliance.

Hellenic League (under Philip)

Also known as the League of Corinth. A panhellenic league established by Philip II of Macedonia after the battle of Chaeronea in 338.

Having effectively subdued Greek resistance to Macedonian expansion, Philip sought to impose his control and enforce a peace throughout Greece. To that end, he united the Greek states in a congress held at Corinth. The only state that refused to participate was Sparta. The League’s governing terms dictated that the participant states should keep a Common Peace and punish any who broke the accord. They also received votes on the League’s council and were required to provide a military levy to a joint Greek army.

Shortly after the League’s establishment, Philip revealed plans for an

invasion of Persia. He was elected as commander-in-chief (*strategos autokrator*) of the League, and before his death made preparations to lead this joint army to invade Asia.

Hellenica Oxyrhynchia

Hellenica Oxyrhynchia is the Latin title (meaning “Greek Historical Work from Oxyrhynchus”) applied to over 200 papyrus fragments, some of considerable length, of a Greek historical work discovered at Oxyrhynchus in Egypt and first published in 1908. These finds have been supplemented by two accessions of much smaller but important fragments, published in 1949 and 1976.

The content of the surviving parts of the work comprises: (a) events in the last part of the Second Peloponnesian War, and (b) events in the Greek world in 396–395, principally the lead-up to Corinthian War and Agesilaus II’s campaign in Asia Minor. The scope of the work can only be guessed at. That it was a continuation of Thucydides’ *History of the Peloponnesian War* is indicated by a reference (section 2) to Thucydides by name. That the work went down to the battle of Cnidus (394) is often assumed but is guesswork.

The author’s name is not known for certain. He is competent and well-informed and was writing before the collapse of the Persian Empire, and possibly before the end of the Third Sacred War (355–346). He is therefore dated in the first half of the fourth century, and in early research was identified as either of the two major lost Greek historians at work in that period, Theopompus or Ephorus. Neither identification is convincing, and if the author is identified at all, he is sometimes thought to be the Athenian

Cratippus, about whom little is known, except that he continued Thucydides' History and lived at about the right time. More commonly, the author is left as an unknown and is conventionally designated for convenience as "P" (apparently for "Papyrus," but this has been denied).

The smaller part of the surviving text deals with Athenian attacks on Megara and Ephesus in 409 and the battle of Notium of 406. Like the much longer part dealing with 396–395, these texts have important consequences for our understanding of Greek historical writing on these events and of the events themselves. P is a conscientious, if somewhat unexciting, historian, which creates trust. Further, P's accounts are in many particulars closely related to those found in Diodorus (first century) and thus support the version of events that Diodorus gives when he differs from that found in the *Hellenica* of the contemporary Xenophon. Before the discovery of P, Xenophon's version of events was overwhelmingly preferred by modern historians to that of the slovenly and low-caliber Diodorus, even though Xenophon's habits of omission and his bias were known. With the evidence of P available, a positive reevaluation of Diodorus as an historical source has taken place, certainly for the events attested to in the surviving parts of P that overlap with Diodorus and, more controversially and uncertainly, for other parts as well.

The relationship of P to Diodorus is commonly thought to be that P was used as a source by Ephorus for the relevant parts of his *Universal History*. Ephorus himself was a main source for Diodorus in Books 5–15, so that, for all his obvious faults, Diodorus can be seen to include, in some places at least, valuable material deriving second-hand from P through Ephorus.

Hellespont

The Hellespont (modern Dardanelles) was the narrow strait between the Thracian Chersonese (modern Gallipoli Peninsula) on the north and the Troad to the south. Since the Greeks, the Hellespont has been regarded as part of the boundary between Europe (the Chersonese) and Asia (Troad). The Hellespont led from the Aegean Sea to the Propontis (modern Sea of Marmara), thus forming part of the only maritime route between the Aegean and the Black Sea. It had considerable importance as a trade route, especially after Greek cities such as Athens came to depend on grain and other commodities from the Black Sea. The straits are only $\frac{3}{4}$ of a mile (1.2 kilometers) wide at their narrowest point. This gave rise to the legend of Hero, a girl who lived in a tower on one side, and her lover Leander, who, every night, swam the strait to be with her, until one night her lamp that guided him went out and he drowned. (Lord Byron swam the strait to emulate Leander, and now a communal swim to commemorate both Leander and Byron is held every August.)

This narrow crossing made the passage between Abydos (on the Asian side) and Sestos (in the Chersonese) the major crossing point between the continents in antiquity. In Roman times, major roads led to Sestos and Abydos so that travelers or armies could cross the straits by boat. Centuries earlier Xerxes, in about 482, did not expect his army to use boats (or to swim), but instead built two bridges of over 300 ships lashed together so that they could march across; Herodotus gives a detailed description of the method of construction. When a storm broke up the first bridges, Xerxes had the men who built them beheaded and the straits themselves lashed and branded; a second set of bridges allowed the army to cross. In 335, Alexander the Great's army crossed at the same point, though without a bridge, as Alexander invaded Asia partly, he said, as revenge for Xerxes' invasion of Greece in 480. Alexander himself sacrificed a bull to Poseidon and the Nereids at the mouth of the Hellespont, and poured a libation from a golden goblet, seeking success as he was about to set foot on Asia.

But it is the importance of the Hellespont as a passage between the

Aegean and the Black Sea that has most led to conflict in the area. As recently as 1915, control of the straits was the objective of the Gallipoli campaign. In antiquity, it was in many periods equally important, and cities such as Sestos will also have benefited by taxing cargoes. The great Bronze Age site identified as Troy was in a strategic position on the Asian side of the entrance to the strait. As early as the sixth century, Athens took an interest in the area, seizing nearby Sigeum from the Mytileneans and colonizing Elaious at the tip of the Chersonese. In the latter stages of the Second Peloponnesian War, the area saw much fighting as Sparta competed with Athens for control of this all important area. Sestos was the key Athenian naval base, and the final battle of the war occurred when Lysander, based at Lampsacus on the Asian side, surprised and destroyed the Athenian fleet on the European shore of the Hellespont at Aegospotami.

In the Hellenistic Period, the Hellespont was at various times controlled by the Seleucids, the Ptolemies, Macedonia, and Pergamum. Under the Romans, it was no longer of such vital importance until Constantinople became the seat of empire and the Hellespont once again became critical as a route for sea-borne trade and communication with the Mediterranean.

Hellespont Campaign (411–410)

A campaign fought early in the Decelean War (413–404)—the resumption of full hostilities in the Second Peloponnesian War (431–404)—to control the vital sea lane through the Hellespont. Without it Athens could no longer feed itself and would have to surrender. Although it ended with Athenian victory, this campaign saw the beginnings of Persian support to Sparta, which formed an important part of the latter's ultimate victory.

The campaign was conducted against the backdrop of the huge Athenian losses in Sicily and political turmoil in Athens. In 411, influenced by an offer from Alcibiades to secure Persian help, an oligarchic coup overthrew the government. The fleet and troops at Samos remained loyal to the democracy and the Hellespont campaign was conducted by them, not the oligarchy in Athens.

In the event, Alcibiades failed to deliver and in April 411, when Sparta recognized Persian sovereignty in Asia Minor (abandoning the Greek cities there), the satrap Tissaphernes agreed to fund the Peloponnesian fleet. This laid the foundations for ultimate Spartan naval dominance in the region.

Early that summer, the Spartan Dercylidas, supported by Pharnabazus, the Persian satrap for the Hellespont, occupied Abydos. In September, Mindarus, the new Spartan admiral, tired of Tissaphernes' games with funding, transferred his fleet north to work with Pharnabazus. Mindarus reached the Hellespont undetected and disrupted the shipping route.

In response the Athenians under Thrasybulus and Thrasyllus moved north, won a close-run naval battle at Cynossema and cleared the route through the Hellespont. In April/May 410, at Cyzicus in Ionia, the Athenians under Alcibiades won another major victory. He drove ashore and captured the 60-strong Peloponnesian fleet (Mindarus was killed), defeated the Peloponnesian and Persian land forces, and recaptured Cyzicus.

This campaign removed a serious Peloponnesian threat and led to the restoration of democracy at Athens and the formal return of Alcibiades. It boosted Athenian confidence so much that they (with hindsight, foolishly) rejected peace overtures from Sparta.

Helots

Helots were slaves in Sparta but of a type different from the privately owned chattel-slaves elsewhere in the Greek world. Helots were the property of the Spartan state. Although direct evidence is lacking, Helots appear to have been attached to parcels of land, so that they were owned the landholders. Helots could not be freed by individuals, only by the state.

The Helot population of Laconia was created by the Spartan conquest of this region in very early times (ca. 900–800?). The later Spartan conquest of Messenia to its west (in the First Messenian War, traditionally ca. 736–716) further increased the number of Helots, this name sometimes being loosely applied to the Messenians when it properly referred to the slaves in Laconia. Unlike the privately-owned slaves in other parts of Greece, who had no personal identity or family and communal life or social status, Helots lived in village communities and had families and cults of their own. They cultivated the lands of their masters in return for a fixed part of the annual produce, which could not be exceeded. They had a defined status but their subjection was reinforced by such obligations as that of taking part in mourning a dead Spartan king (Herodotus 6.58).

In war, Helots are first heard of in connection with the battle of Plataea (479): 35,000 Helots are said to have accompanied the 5,000 Spartiate hoplites and another 5,000 Helots the 5,000 *Perioikoi* hoplites sent by Sparta (Herodotus 9.10, 28–29). Although Herodotus (9.29) clearly states these men served as light armed troops, it is not certain whether they had been sent primarily to fulfill this role, or as laborers and porters, or simply so they could be kept close to their masters under arms and not be left to make trouble at home. Later, Helots regularly accompanied the Spartan army on

campaigns (e.g., Thucydides 5.57) but not in such great numbers. Light-armed troops are often inconspicuous in Greek sources and were often of only minor military importance. Explicit evidence of Helots being used as light-armed troops is lacking, which may reflect a lack of training and organization and their playing only a minor role on the fringes of combat.

In later times, selected volunteer Helots were used as troops, such as those who served as hoplites under Brasidas in Thrace and fought at the battle of Mantinea (418). The recruitment of Helots as hoplites, known as *Neodamodeis*, was regularized at this time. Presumably these Helots were equipped and trained as hoplites by the state only after careful selection. Normally Helots were not allowed to own weapons or, when serving on campaign, even to approach stacks of weapons (Xenophon, *Constitution of Sparta* 12.4).

Thucydides recounts (4.80) an incident, which occurred at some indeterminate time before midsummer, 424: Helots who thought that they had given good military service were invited to come forward for rewards. The 2,000 who did so were taken around the temples and then secretly liquidated. Thucydides brings in this story to support his observation that Spartan treatment of the Helots had security as its priority.

Like other similar nonchattel-slave populations in Greece living in communities, such as the Penestae in Thessaly, the Helots were capable of revolting and did so on two known occasions: the Second (ca. 650–630) and the Third Messenian War (ca. 465–456). In 370/69, Epaminondas' army permanently liberated the Helots of Messenia. Many Helots in Laconia also rebelled at this time (Xenophon, *Hellenica* 7.2.2) but it is not clear what became of them after the Boeotian army left Laconia. For most of their history, Helots remained quiescent, partly though the stringent security measures in force (such as the *crypteia*) and partly though the willingness of some Helots to serve their masters. The Athenian occupation of Pylos in Messenia (425–409/8) caused Sparta constant anxiety but led to only small-scale defections of Helots and no general uprising. In the invasions of Laconia in 370/68, 6,000 Helots volunteered to take part in what at the time looked like a last-ditch defense of Sparta (Xenophon, *Hellenica* 6.5.28–29).

There were still Helots in Laconia in the time of King Cleomenes III (reigned ca. 235–222), when 6,000 of them paid 500 drachmas a head for their freedom (Plutarch, *Cleomenes* 23). Later, Laconia was repeatedly invaded in wars with Philip V of Macedon, the Aetolians, and the Achaean

League. Spartan institutions were radically changed by the tyrannies of Machanidas (ca. 209–207) and Nabis (207–192). Nabis freed Helots for military service. After his downfall and his ex-Helot soldiers were forced into exile, Sparta was incorporated into the Achaean League (192–146). Amidst these upheavals, the Helots disappear from view. Some may have been incorporated into the citizen body of Sparta, others absorbed into the communities known in the first century as the Free Laconians.

Hephaestion (d. 324)

Hephaestion, son of Amyntor, was Alexander the Great's closest friend, and reputed lover. He was a good general and became Alexander's second-in-command. However, his accomplishments are often overlooked because of his personal relationship with Alexander. A Macedonian noble, Hephaestion may have trained with Alexander in the school of Royal Pages. At Gaugamela, he commanded Alexander's close protection party and in 330 became co-commander of the Companion Cavalry. During the Indian campaign, Hephaestion (with Perdikkas) led a large part of the army on an independent mission and later distinguished himself at the Hydaspes. In 324, Alexander appointed Hephaestion chiliarch and married him to the

sister of one of his own wives (a daughter of Darius III). Shortly afterward Hephaestion died after a fever. Alexander was inconsolable and conducted a huge funeral; the oracle at Siwa (perhaps influenced by Alexander) declared Hephaestion a hero, or demi-god.

Heraclea Trachinia

Heraclea Trachinia was a colony founded by Sparta in 426, close to the site of the old Malian town of Trachis, which had asked Sparta for help against the Oetaeans to the west. The Spartans sent three oecists (leaders of a colonizing venture), together with Spartan and other Greek colonists; the population of Trachis most likely also became citizens of the new venture. Heraclea was probably established on a slightly higher and more defensible site than Trachis. Sparta, embroiled in the Second Peloponnesian War against Athens, had several good reasons for controlling this site. It was about 8 kilometers (5 miles) west of the pass at Thermopylae, and according to Thucydides the Spartans thought they could use the area as a naval base for operations against Athenian-controlled Euboea (though this does not in fact seem to have happened). Most importantly, it was close to the northern end of the primary route between the Corinthian and Malian Gulfs, through passes that skirted the western flank of Mount Parnassus. Given Athenian control of the sea, this (and not the route across the Isthmus of Corinth) gave Sparta its main access to northern Greece. It was, for example, used by Brasidas in 424. Unfortunately, the city soon came under attack from most of its neighbors, was badly served by Spartan governors, and in 419 was taken over by the Boeotians. In 399, it fell into *stasis* (violent internal conflict). In 371, Jason of Pherae captured the town and razed its walls, but

it continued to exist as it sent representatives to Delphi in the later fourth century. By then, however, Heraclea had lost its primacy in the area to Lamia.

Hermocrates of Syracuse (d. 407)

Hermocrates was a Syracusan democrat and military commander, instrumental in the defeat of the Athenian expedition to Sicily (415–413) in the Second Peloponnesian War (431–404). In 424, he persuaded the Sicilians to unite against Athens’ interference in their affairs. In 415, he was prominent in the resistance to the Athenian attack on Syracuse and after its defeat led the Syracusan naval contingent in the Spartan operations in Asia Minor (412). However, he and his colleagues were exiled *in absentia*. He subsequently attempted to reestablish Selinus free from Carthaginian control and was killed in 407 in an unsuccessful attempt to gain control of Syracuse. His daughter married Dionysius I of Syracuse.

Hero of Alexandria (ca. 10–ca. 70 CE)

Hero of Alexandria was a Greek mathematician and engineer who lived and worked in Alexandria, Egypt. He is considered one of the greatest inventors of antiquity and his work was influenced by ancient Egyptian, Babylonian, and Greco-Roman sources.

Hero wrote numerous treatises on mechanics, metrics, mathematics, and geometry. Some of his most important works on mechanics were the *Pneumatica*, *Automatopoietica*, *Belopoeica*, and *Cheirobalistra*. The *Pneumatica* describes mechanical devices worked by air, steam, and water, such as singing birds, coin-operated machines, and the *aeolipile* (the first steam-powered engine). Hero’s other major work on mechanics, *Mechanica*, which survives only in an Arabic translation, is heavily based on Archimedes’ work. The *Belopoeica* dealt with military equipment, in particular catapults of various kinds, and provides formulae for the best weight and length of projectiles.

Most scholars agree that Hero taught at the Museum of Alexandria, as most of his writings are in the form of lecture notes and textbooks for courses in mathematics, mechanics, physics, and so forth.

Herodotus (ca. 485–425)

Herodotus was an ancient Greek historian, dubbed “the father of history” (Cicero, *Laws* 1.5), whose account of the background and progression of the Ionian Revolt and Persian Wars (499–479) is the oldest surviving historiographical work of antiquity. No other works of Herodotus are known to have existed.

The Histories describes the beginnings and course of the conflicts between the Persian Empire and Greece at the beginning of the fifth century. The first four books trace the growth of the Persian Empire under the Achaemenid kings and include ethnographical accounts of the peoples they attempted to subject, including the Lydians (1.93–4), Egyptians (Book 2), Scythians (4.1–82), and Libyans (4.168–199). Flashbacks enclosed within the main narrative are key sources for the history of Archaic Greece and the phenomenon of Archaic Greek tyranny (e.g., 1.56–68 on Athens and Sparta, 3.48–53 and 5.92 on Corinth).

The main narrative of Books 5 and 6 is the account of the Ionian Revolt, which precipitated Persian expeditions against Greece. Darius’ attack at Marathon in 490 culminated in Athens’ famous victory (5.105, 6.94–120). The buildup to and course of the retaliatory campaign of Darius’ successor, Xerxes, is recounted in Books 7 to 9: the heroic Spartan defeat at Thermopylae (7.201–203), the inconclusive sea battle of Artemisium (8.1–18), the Greek victory contrived by Themistocles at Salamis (8.40–125) (all in 480), and finally the defeat at Plataea (479) of Xerxes’ general, Mardonius (9.25–89).

The key ingredients of Herodotus’ historical method are eyewitness evidence, oral tradition, and his own judgment (see e.g., 2.99). His keen awareness of the problem of sources and sophisticated approach to historical explanation are increasingly recognized. As he was a citizen of Halicarnassus, a Greek city-state in Asia Minor on the cusp of Greek and non-Greek worlds and under Persian rule in Herodotus’ childhood, a stance

of cultural relativism imbues his work (see 3.39).

Hieron I of Syracuse (Ruled 478–467/6)

Hieron, the second Deinomenid tyrant, reinforced Syracuse's power in Sicily and interfered in the affairs of the *poleis* of Magna Graecia. Hieron's greatest military achievement was his decisive victory over the Etruscans at the naval battle of Cumae in 474 that curtailed Etruscan influence.

Upon the death of his brother Gelon in 478, Hieron became the tyrant of Syracuse. In 476/5, Hieron destroyed Naxos, removed the inhabitants from Naxos and Catania and resettled them at Leontini. He then refounded Catania as Aetna (Diodorus 11.49.1–2). In 472, Hieron allied with Himera to defeat Thrasydaeus, and overthrew the Emmenidid tyranny at Acragas (Diodorus 11.53.4–5).

Hieron used diplomacy to prevent Anaxilas, the tyrant of Rhegium, from attacking Locri in 477, and he provided assistance to Sybaris against Croton in 476 (Diodorus 11.48.3–8). In 474, Hieron formed an alliance with Aristodemus, the tyrant of Cumae, and Syracusan and Cumaean naval forces defeated the Etruscans in the Bay of Naples, off the coast of Cumae (Diodorus 11. 51.1–2). Afterward, he established a (short lived) garrison on Pithecusae to control navigation in the bay.

Hieron died in Aetna in 467/6. He was succeeded by Thrasybulus, the last Deinomenid tyrant.

Hieron II of Syracuse (ca. 306–215)

Hieron II was a Syracusan general and tyrant, born ca. 306. Hieron served under Pyrrhus of Epirus during the latter’s campaigns in Sicily and, in 275, seized power in Syracuse in a military coup and consolidated his power by marrying Philistis, the daughter of a leading citizen. He ruled the city until his death in 215, aged about 90. His rule brought stability and economic prosperity to Syracuse. At first an enemy of Rome, he became one of their most loyal allies, and played an important role in the First Punic War.

In 268, Hieron inflicted a heavy defeat on the Mamertines, Campanian former mercenaries who had seized control of Messina, on the Mylaean plain near the River Longanus. Upon his return to Syracuse he was proclaimed king. Although his conflict with the Mamertines also brought him into conflict with the Romans, he quickly resolved his differences with them, becoming their loyal ally during the First Punic War.

Later in his reign, he shared power with his son Gelon. During his long and mostly peaceful reign Hieron embarked on public building programs including strengthening the fortress at Euryalus and employing Archimedes to design war machines for the defense of Syracuse. Gelon died before his father, and Hieron was succeeded by his grandson Hieronymus.

Hieronymus of Cardia (d. ca. 250)

A contemporary and historian of the Successors of Alexander. His writings are the ultimate source of historical information for the generations following Alexander's death until the treaty between Antigonus II Gonatas and Alexander II of Epirus. According to Pausanias he hailed from the Greek city of Cardia in the Thracian Chersonese (the Gallipoli Peninsula), and was employed in the service of Alexander's secretary, Eumenes of Cardia.

He fought with Eumenes against first Perdiccas and then Antigonus, until his defeat at the battle of Gabiene in 316. Wounded, Hieronymus was captured by Antigonus and entered his service and was present at the battle of Ipsus in 301. He retained his status in the court of the Antigonids, and was appointed as the harmost of Boeotia by Demetrius I Poliorcetes in 293. His well-informed history was heavily used and widely known in the ancient world. Diodorus Siculus relied on him extensively, Arrian less so. Plutarch used Hieronymus' work for his biographies of Eumenes, Pyrrhus, and Demetrius Poliorcetes. However, since he was never quoted verbatim and only fragments of his writings have survived, his style is difficult to judge, although Dionysius of Halicarnassus found him boring.

Himeras, Battle of (311)

A battle fought in mid-summer 311 at the River Himeras (modern Salso) on the south coast of Sicily, between the Greeks under Agathocles, tyrant of Syracuse, and the invading Carthaginians. The Carthaginian army under Hamilcar totaled 40,000 infantry and 5,000 cavalry, including Greek allies and exiles. Agathocles was outnumbered: he had a mercenary army of 10,000 infantry and 3,500 cavalry, together with an unknown number of citizen troops.

At first, both armies occupied defensive positions on hills at either end of the plain divided by the river. Agathocles lured some Carthaginian foragers into an ambush by the river. When they retreated in confusion to their fortified camp, Agathocles launched an attack that almost succeeded but was beaten back when Hamilcar threw in a force of 1,000 slingers from the Balearic Islands. A second assault by the Greeks was also on the point of capturing the camp when a Carthaginian convoy unexpectedly landed fresh troops. The Greek withdrawal turned into a rout. The Carthaginian cavalry pursued the Greeks across the plain and trapped many in the riverbed.

Over 7,000 Greeks and only 500 Carthaginians were killed. Agathocles retreated to Syracuse but, instead of standing a siege as was expected, he reversed the situation by invading Africa.

Hippeis (sing. Hippeus)

The plural, *hippeis*, means “cavalry” while the singular means “cavalryman” or a rider in general. At Athens, the term *hippeis* also denoted members of the second highest of the census classes established by Solon around 575. At Sparta, the term *hippeis* was used for the 300-strong bodyguard to the king. These originally may have been mounted, but by the Classical Period were clearly hoplites. The earliest reference to them (Herodotus 1.67) places them in the second half of the sixth century. The famous “Three hundred” killed at Thermopylae with Leonidas may have been this bodyguard.

Hippias. See Peisistratidae

Hippotoxotai (sing. *Hippotoxotes*)

Hippotoxotai were horse archers. Based on artistic evidence, *hippotoxotai* of Scythian origin may have been used in Athens from the first quarter of the fifth century. In the second half of that century, they formed a 200-strong contingent attached to the Athenian cavalry corps. Their last attested usage was in 395 and by the middle of the fourth century (perhaps by ca. 365) they seem to have been replaced by *hamippoi*, or light infantry who operated with the cavalry. Their status is debated, with some historians arguing that they were state-owned Scythian slaves. However, this is far from certain—although slave foot archers were used in a police role in peacetime Athens, the Greeks generally did not make use of slaves in combat roles. In addition, citizens did serve as dismounted archers and Alcibiades the Younger served with the *hippotoxotai* after expulsion from his cavalry squadron on campaign in 395. Unfortunately, how *hippotoxotai* were used is also uncertain. Xenophon notes they led the charge of the cavalry, which suggests they rode ahead to soften up the enemy. Other likely uses include scouting and raiding, with raiding the most likely function of the 20 sent to

Melos in 416. Following Alexander's conquest of the Persian Empire horse archers became a common element of the successor armies.

Histiaeus (d. ca. 494/3)

Histiaeus, the tyrant of Miletus, was an accomplice in the Ionian Revolt with Aristagoras. For his support of Darius in the Scythian campaign, he was rewarded with Myrcinus, in Thrace. However, Darius suspected Histiaeus' endeavors in Thrace, and invited him to stay in Susa on the pretext of needing his assistance. Histiaeus later sent a secret message to Aristagoras, by shaving a slave's head, tattooing the message on the scalp, and letting the hair regrow. This instructed Aristagoras to foment rebellion in Ionia, hoping he might be required to return home to quell it. Darius did send him back to Ionia for this reason, but in Sardis, Artaphrenes, the governor, indicated his suspicions about Histiaeus' involvement in the origins of the revolt. Histiaeus escaped, but was eventually recaptured by the Persians in Mysia, impaled on Artaphrenes' orders, and his embalmed head sent to Darius.

Homeric Warfare

The name of Homer is associated with two great epic poems, the *Iliad* and the *Odyssey*, which the Greeks counted as their most important pieces of literature. Nothing is known about the author, and there have long been arguments as to whether the same poet wrote both poems. But it is generally agreed that the poems come out of a tradition of oral poetry in which bards or rhapsodes would take up traditional stories and, in retelling them, constantly reshape them. But the *Iliad* and *Odyssey* seem to have reached their final form, most likely in the early seventh century (some place them a little earlier), after which they became canonical and changed very little. They are two of the great masterpieces of Western literature.

The two poems are works of fiction set in an imagined epic past, in which heroes were greater and stronger, and in which the gods played an active role in human affairs. This, plus the fact that actual Bronze Age sites exist at some of the key places in the story, has led many people to suppose that Homer's stories represent dim memories of society and events of the Mycenaean Period. But this view has little to commend it, and is steadily losing ground. It is implausible that an active oral tradition of story-telling (as against oral "record-keeping") would preserve original elements over a period of some 500 years, and in fact the political structures described in the poems differ markedly from the more autocratic and centrally controlled kingdoms suggested by Mycenaean archaeology and the Linear B tablets found at Mycenaean sites. The impressive visible ruins of the Bronze Age sites may well have encouraged poets to imagine a lost and glorious world: but it was a work purely of imagination, for there is no evidence of any active memory of the Bronze Age surviving.

The poems are set in the period of the Trojan War: the *Iliad* during the last of its 10 years, the *Odyssey* in the 10 years afterward as Odysseus made his long way home. They depict an imagined world of the past, but portrayed in a way to be meaningful to the poet's audience, while presumably also being flattering to the upper classes who provided hospitality to the poet and paid for his services. They may well obliquely reflect social change at the time of their composition. In *Iliad* 2, a common man, Thersites, dares to speak up against the aristocratic leaders of the expedition, and is roundly abused (and indeed beaten up) by Odysseus for doing so. It is tempting to see this as evidence that, in the period the story reached its final form, the "big men" of Greek towns were indeed being challenged by the lower social orders, such as small farmers, men

represented here by Thersites. In the *Iliad*, the poet can please his aristocratic audience by making Thersites astoundingly ugly, and by allowing Odysseus to shut him up: a pleasing fantasy for the aristocrat, but at odds with the real world where social change was afoot.

Homer's vivid descriptions of battles, spread throughout the poem, indicate clearly that there are large masses of infantry fighting, but in fact place most of their focus on the deeds of named heroes and other men of above average rank. Homeric battles thus often crystallize into a series of individual combats, or at least individual "kills" (the victim is often not aware of being targeted until too late). The actual damage that weapons cause to human bodies is described in astounding, slow-motion detail; there is nothing else to match this in Greek literature. This focus on individual combats within a general conflict spread across the battlefield is partly literary convention, a way of creating stories out of mass confusion and a way of distilling heroism and pathos from the mass. Homer often stops to tell the reader a little about the background of a man who is about to die; the heroes make implausibly long speeches in the midst of battle; and the gods are quite often prepared to intervene to save a favored mortal. These devices help make the poem work as entertainment. The focus on heroic men of the upper class will also have pleased the rhapsode's aristocratic patrons, many of whom believed that they could number Homer's heroes among their own ancestors.

The arms and armor of the heroes is varied, but not far different from the hoplite equipment that was probably in use by the time the epics reached their final form. Shields in particular seem mainly to be the round, concave hoplite shield, often with one or more bosses, and with an interior handle. Hans van Wees has argued that, even where a shield appears at first sight to be different, such as the shields of Ajax, Hector, and one or two others, which reach to their feet, this just means that they were exceptionally large but of the usual shape. Such a large round shield would be too heavy for a normal man to wield, but the heroes are consistently said to be superhumanly strong compared to any man of the poet's own day.

The warriors typically wield spears (sometimes again of exceptional size), and use them for both thrusting and throwing. The latter is more usual in combat, with spears and swords (also regularly carried) used at close range, usually to finish an enemy off. Some aristocratic warriors, such as Paris and Teucer, fight as archers, but in general Homer seems to regard the

bow, along with the sling, as a weapon more suitable for the common mass of infantry. The heroes typically wear bronze corselets and greaves and a bronze helmet with a plume (which frightens Hector's young son, Astyanax); there are occasional descriptions of leather or leather-and-felt caps. Being mythical heroes, their equipment is also often imagined as sporting plenty of gold and silver.

Around the heroes on both sides there is a large anonymous mass of soldiers, who clearly play a significant role in the battle, even if the poet often leaves them in the background. At times they are clearly described as fighting in close order, and some have seen this as evidence that Homeric warfare was really hoplite warfare, skewed to focus (for literary and social reasons) on the epic heroes. At one point, for example, the armies advance, and

When they came crowding together on one spot, close together they struck with oxhide shields and spears and the strength of bronze-plated men, but bossed shields were pressed against each other, and a great din arose. Then mixed together there were the lamentations and shouts of triumph of men destroying and being destroyed and the ground ran with blood. (Homer, *Iliad* 8.60–65; trans. Londey)

On another occasion, in the fight over a body, men mass together and the poet shows an awareness of the advantage of mutual support by shield-wielding foot-soldiers:

For Ajax went around every one of them giving many instructions: he ordered no one to retire behind the corpse, nor to fight in front, jutting out from the Achaeans [Greeks].... Nor indeed did the Danaans [Greeks] fight without shedding blood, but many fewer perished, for always in the tumult they gave heed to ward off from each other the killing that hung over them. (Homer, *Iliad* 17.356–365; trans. Londey)

But more often the fight, except in desperate situations, seems fluid, and in some way the heroes can range around the battlefield seeking out opponents of suitable rank. While this might simply be literary fiction, Hans van Wees has suggested that it is in fact similar to anthropologists' accounts of battles in New Guinea, in which men would move to the front and then back to the rear several times over the course of a day, taking rests out of

the battle before heading back to the fray; similarly, in early Zulu warfare a man would withdraw after killing an enemy. This seems similar to the Homeric battlefield, in which individuals can leave the battle for a while before returning to the front to fight as *promachoi* (lit. “fighters in front”). The advantage of van Wees’ thesis is that it allows Homer to give a moderately realistic account of an early seventh century battlefield, while also providing a good setting for poems later in the seventh century in which the Spartan Tyrtaeus exhorts his fellow citizens to stand firm at the front and not to drop back out of the fighting (see, for example, QQ 57).

Two-horse chariots are a consistent part of Homer’s battle scenes, each carrying a warrior and his charioteer. They are exclusively the preserve of heroes and other big men in the army: they are clearly a sign of social status. Heroes almost never use them as a fighting platform: rather, the chariot gives the hero mobility and prominence on the battlefield, but he dismounts to fight among the *promachoi*, while the charioteer takes the horses and chariot back out of harm’s way, but remaining close enough to come and pick up the warrior when need arises. If the warrior is killed, the charioteer never tries to recover his body, but rather turns and retires: the horses themselves are valuable and need to be preserved.

Many have felt that Homer’s depiction of chariots as “battlefield taxis” shows him wrestling with a piece of equipment from early warfare that he no longer understands. But in fact the depiction of chariots in battle is far less likely to be a surviving Bronze Age element than a borrowing from Assyrian warfare contemporary with or a little before Homer’s time. Xenophon, writing admittedly much later, describes the Assyrians of the past using chariots in battle in exactly the way Homer describes. Hans van Wees, on the other hand, has argued that not only is this a plausible way of using chariots on a battlefield where the infantry were mostly fighting in open order, but that the evidence of vase-painting suggests that chariots were in fact used in Greece, despite the general unsuitability of the terrain.

van Wees has argued that paintings on Greek vases of the first half of the seventh century (700–650) best matches the warrior equipment described in Homer. This then becomes an important piece of evidence for dating the final composition of the *Iliad*. By later in the seventh century, in the poems of Tyrtaeus, we can see development toward the ideology of close-order hoplite warfare. This may suggest that Homeric warfare is in fact, once stripped of literary embellishment, a reasonably accurate account

of warfare at a particular moment in time, when recognizably hoplite equipment had been adopted, presumably for greater self-protection within a fluid battlefield, but before the close-order phalanx and the primacy of hand-to-hand fighting had taken over (a process itself which, some would argue, was only completed a century or more later).

Hoplites

Hoplites were the heavy infantrymen of ancient Greece. The name derives from the Greek word *hoplon*, which is both one of the names for the hoplite shield and also a term that means "equipped" (i.e., a hoplite is a man equipped for war). The origin of the hoplite way of fighting is a contested issue among scholars who variously date the beginnings of this organized style of combat to the eighth and seventh centuries. The hoplite rose out of the more open and heroic styles of warfare seen in the previous Mycenaean Period of Greek history. Homer, in his work the *Iliad*, does refer to massed

formations of fighting men but how closely these formations resembled the more structured formations of the Classical Period is far from certain. Herodotus (1.171) credits the use of shields with a central grip, the attachment of crests to helmets and the application of designs to shields (all elements of massed hoplite fighting) to the Carians of Asia Minor. Apollodorus (*Library of History*, 2.2.1), on the other hand, credits the invention of the hoplite shield to the Argives.

Regardless of origin, the shield and a long thrusting spear were the mandatory requirements for fighting as a hoplite. Other accouterments such as helmets, swords, body armor, and greaves were optional in many city-states of ancient Greece. The reason for this flexibility in the equipment of the hoplite was that many city-states such as Athens possessed no permanent standing army whose panoply was supplied by the state. Rather each male citizen possessing sufficient wealth was required to supply their own equipment as part of their eligibility to serve in the state's part-time militia. The cost of such equipment could be extensive. A fine suit of armor could cost 1,000 *drachmae*. Helmets could cost 100 *drachmae* (Aristophanes, *Peace*, 1221–1222, 1249–1250). Thus it was only members of the middle and lower upper classes of Athenian society who served as hoplites (the very wealthy generally served as cavalry). Such men held other vocations in Athenian society and were only mobilized when the state deemed it necessary to place a contingent of men in the field. Which men were to be called into service was determined randomly either by their age group or by the rolls of the *deme* to which they belonged. Mobilization announcements were then posted in the Agora (see illustration to Military Service, Greek States and entry) and, on a specified day, the men who had been chosen were required to assemble with their equipment and rations for the coming campaign. Troops may have then been drilled to prepare them for battle. When any fighting was over, the survivors would simply return to their regular occupations until called upon again. In the fourth century, Athens instituted the *ephebeia*—a mandatory two-year term of national service for all youths with training in garrisons on the Athenian frontier. However, prior to this time, Athens had no regular long-term soldiers.

The “Johnson Vase,” an Attic black-figure *amphora*, ca. 530–520. The hoplites are depicted with the full panoply of their time—Corinthian helmet, bell corselet, greaves, shield, and spear. The hoplite facing right is probably protecting the body of his comrade from the hoplite with the tripod on his shield, who is trying to secure it to strip it of its weapons and armor. Located in the Classics Museum, Australian National University, Canberra, Australia. (Photo by Bob Miller)

Terracotta *pinax* (plaque), with a running hoplite, late sixth century, Athens. The original name was scratched out and overwritten, but he is described as *kalos* (beautiful). He is equipped with shield, spear, and Chalcidian helmet, but not breastplate and greaves. Although the Athenian hoplites famously ran into battle at Marathon, running any distance made it difficult to maintain the phalanx formation. Located in the Acropolis Museum, Athens, Greece. (Gianni Dagli Orti/Corbis)

The practice of mobilization of a part-time militia in states like Athens is contrasted by the practices of the city-state of Sparta where all male citizens entered the state's rigorous training and education system (the *agoge*) at a very young age to train them to become soldiers and to acclimatize them to the turmoils that may be experienced on campaign. Upon leaving the *agoge* around 21 years of age, the Spartan citizen entered what was essentially the only permanent standing army in Greece during the Classical Period. Spartan hoplites wore similar items of clothing, in particular their distinctive red cloaks, and carried shields bearing a national emblem, a capital lambda (Λ), referring to Laconia, the region of Greece where Sparta was located. This was the closest thing the army of any Greek city-state had to a standardized uniform. The cloak was provided by the state as part of the *agoge* system. It is unclear, however, whether arms and armor were

provided to the Spartan hoplite at state expense as well (and if so, at what stage of their training). However, due to the nature of the Spartan state, with its egalitarian structure, the prohibition of money and luxury, and the restriction preventing any citizen from engaging in trade or commerce, it seems likely that all elements of the hoplite panoply were provided to Spartan warriors by the state—possibly upon successful completion of the *agoge*.

All hoplites, whether from Athens, Sparta or elsewhere, fought in the densely packed phalanx formation—a block of hoplites arranged into regular ranks and files (see illustration in “Chigi Vase” entry and the first illustration in the Phalanx entry). The phalanx formed the core of most armies in Classical Greece. During the early years of the Classical Period, the use of nonhoplite weapons in combat was looked down upon as “unmanly” by many states. However, by the time of the Second Peloponnesian War (431–404), troops such as slingers, archers and mercenaries, and a greater dependence on cavalry as a strike weapon, changed the nature of Greek warfare to the extent that the hoplite phalanx became part of a more combined-arms military institution. However, the hoplite still remained the essential core of most armies of ancient Greece until a new form of warfare was developed in the fourth century that outclassed the hoplite of the city-state—the *sarissa*-wielding phalangite of Macedon.

Hydaspes, Battle of (326)

A major battle in Alexander's Indian campaign, fought at the modern-day Jhelum River. When King Porus refused to submit, Alexander, bolstered by 5,000 Indian allies, invaded. Porus' army occupied the opposite bank of the Hydaspes, presenting Alexander with another opposed water crossing. He had been successful in this at Granicus and Issus but the Hydaspes was a much greater obstacle. Alexander decided on a stealthy night crossing via a headland and island in the river about 150 *stadia* (27.5 kilometers) from his main camp. He distracted Porus with troop maneuvers and night noises over some time, conveying the impression he was going to wait until winter and the end of the flood season. Leaving behind a large force under Craterus, Alexander made his crossing under cover of a storm. He landed his force before Porus' son arrived with 2,000 cavalry and 120 chariots. The chariots proved useless in the mud and Alexander, advancing with 5,000 cavalry and 6,000 infantry, scattered the Indians with his archers and cavalry, killing Porus' son and 400 cavalymen.

Porus left part of his force to prevent Craterus from crossing and moved against Alexander with 4,000 cavalry, 300 chariots, 200 of the elephants, and 30,000 of the infantry. Alexander now faced a new problem: how to combat the elephants, which had been placed at intervals of about 100 meters across the entire frontage of the infantry. Alexander could not risk using his cavalry against the elephants as the horses were unused to them and likely to bolt. Instead, he armed several contingents with axes and sickles to use against the elephants' trunks and feet. He also kept back the infantry in the middle of his line, making his initial attack on the left wing with mounted archers, closely followed by cavalry. More cavalry was sent around the Indian left wing to attack its rear, aided by the arrival of other parts of Alexander's main force. Macedonian cavalry attacked the Indian right wing when the Indians weakened it by moving cavalry from there to help the left. Once Alexander had neutralized the enemy wings, his infantry advanced against the Indian elephants and infantry. Alexander had deployed the axe and sickle-equipped infantry and others with javelins opposite the elephants and *sarissa*-armed infantry against the Indian infantry in between the elephants. As planned, the javelins, axes, and sickles were effective against the elephants, many of which rampaged through their own men. The Indian line fell into confusion and Porus was forced to surrender when overcome

by numerous wounds.

Craterus, crossing the river elsewhere, pursued and destroyed the fleeing Indian survivors. Alexander confirmed Porus as a vassal king, reportedly so impressed by his courage and demeanor that he gave him additional territory. The battle demonstrates the sheer professionalism and skill at this time of all elements of Alexander's army, including the leadership.

Hysiae, Battle of (669)

A battle of doubtful historicity, in which the forces of Argos defeated a Spartan army in 669. By tradition the battle, which took place near Hysiae, a small town in the hills southwest of Argos, represented the apogee of Argive power. Some have suggested that the victory was linked with the early development of hoplite tactics at Argos. In the second century CE, the travel writer Pausanias reported seeing graves reputed to be those of the fallen Argives.

Illyria, Illyrians

For the Greeks, “Illyrians” was a general term for a group of in fact disparate Indo-European tribes who lived west of Macedonia and north of Epirus, on and inland from the Adriatic coast. The Greek “Illyria” referred to a more restricted area than the later Roman term “Illyricum.” Migrating south around the tenth century, Illyrians established settlements in some later Greek or Macedonian areas such as Corcyra, Leucas, and Vergina. After Greek settlers arrived, there was considerable cultural and trading contact between them and the Illyrians. There was also ongoing conflict. For example, the crisis in the 430s at Epidamnus on the Adriatic coast was caused because the city was fighting Illyrians in the hinterland, while the Illyrians were supporting a group of Epidamnian exiles. But the main Illyrian tribes, the Liburnians, Dardanians, Ardiaei, and Autariatae, were never united, and indeed spent much time fighting each other.

The Dardanians were a particular threat to Macedonia, and under their king Bardylis comprehensively defeated a Macedonian army under Perdiccas III. Perdiccas was killed, clearing the way for his brother, Philip II, to take the Macedonian throne in 359, perhaps after a brief period of regency. The following year, Philip equally comprehensively defeated Bardylis, killing the king and 7,000 of his men. Philip fought further campaigns against the Illyrians in about 351 and in 345, reducing the Dardanians to client status. He also fought campaigns against the Ardiaei (345) and Autariatae (337). Soon after coming to the throne in 336, Alexander the Great fought a further campaign in Illyria to shore up his borders. By the early third century, the Dardanians had recovered, and in 284 initiated prolonged warfare against Macedonia. In 229, they defeated

Demetrius II of Macedonia in battle. They finally came under Roman control in the first century, but remained notorious as bandits well into the Imperial period.

Internal Security

Internal security encompasses policing, counter-espionage, and public order—essentially anything preventing an internal activity (whether from external or internal forces) hostile to a state or its government. This is during times of both war and peace, but excludes external military action (unless this has an internal component, such as a traitor opening a gate to the enemy). Internal security measures can include those as diverse as tyrants' use of a bodyguard, mercenaries, hostages, and executions, through to state police forces, spying, and even the use of garrisons.

Ancient Greece had nothing like the internal security apparatus of modern states—most cities did not even have a police force—and the level of, and emphasis on, internal security varied from state to state and over time. However, the approach to internal security and the level to which it developed in Greek states were essentially determined by three things: the perceived threat, the resources available to meet it, and the culture of the state.

Democratic Athens, for example, largely relied on its legal apparatus and the support of the majority of the population to preserve its public order and internal security. Although it had a small police force, this was presumably largely directed at criminal activity in the Agora and other

commercial or civic areas. Sparta, on the other hand, was a much more closed society and constantly concerned with the threat of a helot revolt. It expelled foreigners annually, had a secret police (the *crypteia*), and its entire *agoge* and military system could be regarded as designed to meet internal as well as external threats. However, as with many areas of Greek history, although most of our evidence comes from Athens and Sparta, neither of them were really typical *poleis* (city-states).

At the base level of public order, most *poleis* saw the threat as emanating from excessive public emotion over issues. These could arise from overly emotional women (generally seen as a threat to good [male] order in a city—see, for example, Aristophanes' *Lysistrata* and *Ecclesiazusae* [*Parliament of Women*] and Euripides' *Bacchae*) or disorder arising from economic or other issues. In one Athenian case, the tragedian Phrynichus was fined for arousing strong public emotions with his play about the Persian capture of Miletus (494).

Most cities seem to have had limited mechanisms for controlling threats to public order. Most threats were dealt with by legislation—for example, Solon's sixth century reforms at Athens were designed to defuse social stress over primarily economic issues. His measures reputedly included a law requiring all Athenians to take up arms against individuals attempting to establish a tyranny. This is an example of legislation to formalize what was the practice in most states, which generally relied on the citizen body to rally against threats to public order. However, this had clear limitations when public order was threatened by a large part of the citizenry and also contained the real risk of a response to a threat degenerating into *stasis* (civil strife) or civil war.

Few states had anything approaching a police force or standing army—although increasingly from the fourth century *poleis* had small groups of elite soldiers maintained at public expense and these could be used for internal security. In 365, for example, “The Three Hundred” at Elis, along with the cavalry, repressed a democratic revolution. In most cases, the authorities used whatever resources they had at their disposal and in the absence of formal organizations, the response was generally ad hoc.

There were some exceptions, though. Athens had a small police force of Scythian archers (instituted early in the fifth century) who assisted public officials such as “The Eleven” who could arrest people (there was a public jail), and who also carried out executions. This was primarily for criminal

offences, but could be used against threats to the established order. For example, Theramenes' arrest and execution in 404 was carried out by The Eleven on the orders of the oligarchic government (The Thirty Tyrants) to remove a potential source of opposition (Document 13). Athens also had a relatively well-developed court system, which relied on, and rewarded, citizens accusing others of illegal activities. Sparta, with a specific and continual threat from the Helot population had the *crypteia*, an organization designed to eliminate troublemakers and prevent hostile acts. In 399, the ephors used several trusted young men (perhaps from the *crypteia*), supported by cavalry, to arrest Cinadon, who was planning a revolution against the existing Spartan system.

Higher level internal security functions were directed against the threat of assassination, coups, and betrayal of the city to an external enemy. In addition to the ad hoc measures and the more formal systems in Athens and Sparta described above, tyrants and narrow oligarchies typically made use of groups of armed supporters—either citizens or mercenaries—in internal security duties. The Thirty at Athens, for example, used youths armed with daggers to intimidate state bodies such as the *Boule* (Council), or to murder and arrest opponents. One of their tactics was to involve other citizens in arrests to implicate them in their guilt and bind them to their cause. Socrates famously refused to follow the orders of the Thirty to arrest one Leon of Salamis, but the four other citizens selected with Socrates were sufficiently cowed to carry out the arrest anyway. Garrisons could also be installed in a city's citadel to ensure internal security. Some well-known examples include the Spartan/local oligarchic occupation of the Cadmea at Thebes (382–379), the Macedonian garrison on Acrocorinth in the third century, and the Seleucid use of Acra in Jerusalem in the second century.

Other than violent internal revolution or *stasis*, one of the biggest threats to a city's internal security was betrayal to an external enemy. This could occur in times of supposed peace—surprise attacks, especially by those from less settled parts of Greece such as Aetolia were not uncommon. However, they also happened in large *poleis* too. The Spartan seizure of the Theban Cadmea in 382, for example, was with the assistance and on the invitation of a party within the city (Document 28). In 243, Aratus seized Acrocorinth from Macedon by bribing members of the garrison. The threat of betrayal during sieges was particularly severe—the sole extant part of Aeneas Tacticus' military work, *On Sieges*, is largely concerned with

internal security measures.

In general, the more open a society (such as democratic Athens) the less the perceived need for internal security. In these cases, an acceptable level of peacetime internal security could be maintained by the usual means of social pressure, the rule of law, and reliance on the citizen body to deal with any major threat. However, these could be supplemented by special interrogations and trials when the occasion demanded. For example, under the stresses of the Second Peloponnesian War (431–404) the mutilation of the Hermae on the eve of the Sicilian expedition (415) was taken as a threat to the democracy and incurred vigorous reaction (or overreaction).

Less secure forms of government, such as tyranny or narrow oligarchies, faced a greater threat and had to rely on more sophisticated measures such as bodyguards, hostage-taking, central control of weapons and strongpoints, arrests, execution, and garrisons. The Spartan system of the *crypteia*, its annual expulsion of foreigners, and even its entire social and military system can be seen at the extreme end of ancient practice for a *polis* not run by a tyrant, and this resulted from the constant Helot threat to their existence.

Ionian, Ionians

In the Mycenaean Period, the west coast of central Anatolia was variously occupied by Carians, Mycenaeans, and Lycians, among others, and was sometimes even under Hittite control. After the Mycenaean collapse, the coastline from Phocaea to Miletus would be named after a new group, the Ionians, said to have migrated from the Greek mainland.

The Greeks regarded the Ionians as those peoples occupying the lands between the Aeolians to the north, and the Carians to the south. The Ionians self-identified, partly on the basis of dialect, as distinct from their neighbors, but were generally considered part of the same larger ethnic group as Athens. Although Herodotus regards the Ionians as “weak” and the very name “Ionian” degrading (Herodotus 1.143), throughout the Second Peloponnesian War (431–404) the name was used generally to describe the Athenians and their allies.

Herodotus lists Miletus, Phocaea, Myus, Priene, Ephesus, Colophon, Lebedus, Teos, Clazomenae, Erythrae, and the islands of Samos and Chios as forming the Ionian Dodekapolis (group of 12 cities). The Panionium on Mount Mycale was their communal sanctuary and meeting place (Herodotus 1.142–148). Herodotus’ list was not definitive and ancient sources conflict on the details. Herodotus omits many settlements that were Ionian-speaking (e.g., Magnesia, Iasus, and Halicarnassus) or were geographically proximal (for example, Smyrna, which claimed association with the Ionians and sought inclusion); while including some that were seemingly located within other regions (for example, Miletus, Myus, and Priene were all located in Caria).

Ionian had a different experience of conflict from mainland Greece, where generally Greeks fought Greeks; fighting in Ionian frequently involved foreign forces on one, or even both sides. Herodotus begins his history with an account of Croesus of Lydia, who in the sixth century subjugated

mainland Ionia and extracted tribute, while at the same time securing peace with the Ionian islanders. Although Croesus' ancestors had fought Ionians (attacking Miletus and Clazomenae, and sacking Colophon and Priene), according to Herodotus he was the first foreigner to come into contact with the Greeks through alliance.

Ionia remained loyal to Croesus when propositioned by the Persian king Cyrus to revolt. With Croesus' defeat by Cyrus, the Ionians appealed for peaceful terms with Persia. Miletus received such terms, while Chios preserved its isolation by surrendering Lydian dissidents to Cyrus, but the rest of mainland Ionia was overrun and the Phocaeans driven from their home. Ionian soldiers fought alongside Cyrus in Egypt, and under Darius I they bridged the Danube and guarded it against Scythian opponents. They also prompted a Persian attack on Naxos, but when this failed, openly rebelled against their Persian masters in the Ionian Revolt of 499–493.

In the course of the revolt, the Ionians sacked Sardis with Athenian naval assistance, lost Athenian support when they were defeated at Ephesus, but went on to capture Byzantium. The revolt spread to Cyprus, Caria, and the Hellespont, but ended in defeat at the battle of Lade in 494, followed by the sack of Miletus and the reconquest of the rest of Ionia by Darius. The great Ionian temple of Apollo at Didyma was looted and destroyed (although some authors attribute this to Xerxes in 479).

The Ionians fought for Persia during much of Xerxes' invasion of Greece in 480, including at the battles of Artemisium, Salamis (at which they remained mostly loyal despite Themistocles' plea), and Mycale, at which they were not trusted and turned against Persia. After Xerxes' defeat, Ionian troops helped Athens besiege the remaining Persians at Sestos.

The Ionian *poleis* were all members of the Delian League, and fought loyally for Athens through much of the Second Peloponnesian War. Thucydides says that the cities of Ionia were unfortified and therefore feared Spartan incursions, but many (such as Miletus and Colophon) did have defenses, Phocaea famously so. Ionians fought with Athens throughout the Mediterranean, including the failed attack on Potidaea and in the Sicilian expedition. But in 412, Chios and Erythrae revolted from Athens, coinciding with Persia's intervention in the war and sparking a widespread Ionian Revolt that lasted until the end of the war. With Athens' defeat in 404, Ionia quickly fell back under Persian control.

In 395, Sparta campaigned successfully in Ionia during the Corinthian

War, but eventually ceded control again to Persia. Ionia remained in Persian hands until Alexander the Great crushed Miletus as the only Ionian *polis* to resist. After Alexander's death, Ionia as a region became less cohesive, although many individual *poleis* still thrived. They witnessed the wars of the *diadochoi* (Successors), falling first under the power of Lysimachus, then variously into the domain of different kingdoms, primarily the Seleucids, followed by Pergamum. Ionia was then incorporated into the Roman province of Asia.

Ionian Revolt (499–493)

A widespread revolt against Persian rule by the Ionian Greeks, Cyprus, Caria, and island and Hellespontine cities. The revolt originated in Miletus, lasted from 499 to 493, and was a major cause of the Persian invasion of Greece in 490. Herodotus Book 5 provides a detailed account of the revolt, stating that the main instigator was Aristagoras, tyrant of Miletus, influenced by his father-in-law and predecessor as tyrant, Histiaeus. Although the tyrants of the Greek cities in Asia Minor owed their positions to the Persians, many joined the revolt. In addition to seeking local support, Aristagoras traveled to mainland Greece to canvas aid.

Aristagoras' visit to Greece had mixed success—although Athens contributed 20 ships and Eretria 5, Cleomenes I of Sparta refused help. Herodotus records that Aristagoras had almost persuaded Cleomenes to send troops until he revealed that the Persian capital, Susa, was three month's march from the sea. Spartan reluctance to campaign far from home ended his chance of support.

With the mainland Greek assistance, in 498 the rebels marched to Sardis and burnt it. Although the garrison held out on the citadel, this was a significant symbolic victory. Herodotus claims that Darius never forgave the Greeks, and especially Athens and Eretria for this outrage, even though they played no further part in the revolt. This success caused Cyprus, Caria, and the Hellespont to revolt, seriously escalating the threat to Persia. In response, Darius sent out three large armies, some supported by fleets. Although the campaigns were waged simultaneously, the Cypriots were neutralized first. Not all Cypriot cities had revolted, but the rebels defeated the enemy fleet sent against them. Unfortunately, at the same time as the naval action, part of their force deserted when they faced the Persians on land and the remainder was defeated. It took the Persians some time to capture the fortified cities and Soli, the last to surrender, held out until 496. Caria held out until 494. The Carians lost the first two major land battles but retrieved the situation with a successful night ambush in which an entire Persian army was destroyed. A feature of the Carian campaign was the support the Carians received from their Ionian Greek neighbors.

The collapse of Cypriot and Carian resistance left the Ionian Greeks isolated and they decided to make use of their main strength, naval warfare, and stake everything on a naval battle. This was fought at Lade, near Miletus, in summer 494. Although parts of the Greek fleet fought very creditably, as in Cyprus, desertions and disunity led to their defeat. The Persians mopped up, taking each city in turn and using executions and massacres to cow the remaining rebels; city walls were demolished to discourage future revolts. Mardonius was sent to settle the area in 492 and established democracies in many cities. The revolt was hard fought but characterized by disunity among the rebels. The involvement of Athens and Eretria focused Darius' attention on mainland Greece and its potential to cause instability in the Greek territory in his possession. This played a major part in his decision to invade Greece in 490.

Iphicrates (ca. 415–ca 353)

An Athenian general and commander of mercenaries, Iphicrates is credited with revolutionary infantry tactics, especially in his use of light-armed soldiers known as peltasts. In 390, his mercenary peltasts defeated 600 Spartan hoplites at Lechaeum, near Corinth, a feat hitherto thought impossible. This exploit raised the profile of light-armed troops and helped to pave the way for the combined-arms militaries of Philip of Macedon and Alexander the Great. Despite his successes, Iphicrates was a controversial figure at Athens. Though he often acted in an official capacity as an Athenian general, he demonstrated a marked tendency to pursue his own goals despite, and sometimes in direct opposition to, the parameters of his missions and the stated aims of Athens. Iphicrates was closely tied to Thrace, from where the peltast originated. For many years, he served the Thracian kings Seuthes and Cotys, even marrying the latter's daughter and fighting a naval action on his behalf against the forces of Athens itself. He is thus often listed among the so-called *condottieri* of the fourth century, a group of commanders explicitly compared to the mercenary leaders of late Medieval and Renaissance Italy.

Iphicrates first rose to prominence as a protégé of Conon during the Corinthian War (395–387/6), when he is said to have boarded an enemy ship and carried off its commander, armor and all. Aside from his command over peltasts at Corinth, for much of the early fourth century he acted as an Athenian general in many places around the Aegean, including the

Hellespont, Thrace, and Macedonia, where he attempted unsuccessfully to recover the important former colony of Amphipolis. He also served as a mercenary in Egypt. His last major command came during the Social War (357–355), after which he was prosecuted by a rival general. He was acquitted but seems to have died soon after the trial. Many of his campaigns were famous in antiquity, and he was praised as an excellent commander by Xenophon. But he has earned a place in military history textbooks because of Diodorus' account of his infantry reforms. Iphicrates supposedly increased the length of the spear by half, and doubled the length of the sword. He also made the shield lighter and smaller, to a form called the *pelte*, from which his infantry were called "peltasts." However, Diodorus' account is problematic. There were peltasts long before Iphicrates' supposed reforms took place, and we hear nowhere else of these new infantry soldiers. Some scholars, however, believe that Iphicrates' infantryman was an inspiration for the *sarissa*-wielding pikeman of the Macedonian phalanx.

Ipsus, Battle of (301)

Antigonus I Monophthalmus and his son Demetrius I Poliorcetes pressed for dominance over the other Successor kingdoms throughout the last decade of

the fourth century. In terms of the number of combatants on each side, the battle of Ipsus was the largest battle ever fought in the Greek world until the arrival of Rome, with the largest number of elephants ever deployed in battle outside India. It involved the combined forces of four of the last six remaining successors of Alexander and brought about the end of the large Antigonid kingdom in Asia Minor. Other than the death of Antigonus and the subsequent division of his kingdom, there were very few lasting consequences of the battle. Rather it is the scale of the conflict that is of most interest to students of Greek history.

After failed attempts to take Rhodes and Egypt Antigonus tried to take Greece from Cassander of Macedon. Cassander, after failed peace negotiations, asked for assistance from the remaining Successor kings: Lysimachus of Thrace, Ptolemy I of Egypt, and Seleucus I of Babylon. Lysimachus, reinforced by forces sent by Cassander, crossed the Hellespont and invaded Asia Minor, the stronghold of Antigonus' power. Antigonus was in Syria preparing for a festival but Demetrius sent troops to oppose Lysimachus while he remained in Greece fighting Cassander. After initial campaigning Lysimachus decided to wait for Seleucus' arrival and was forced into desperate marches to escape being trapped by Antigonus before winter set in. Demetrius sailed to reinforce Antigonus before Seleucus' arrival; Ptolemy started to invade Syria, but retreated after receiving false news of an Antigonid victory.

At Ipsus, Lysimachus and Seleucus directly opposed Demetrius and Antigonus. It is estimated that Antigonus commanded roughly 70,000 infantry, 10,000 cavalry, and 75 elephants, and that the allies fielded 64,000 infantry, 10,500 cavalry, 120 chariots, and at least 400 elephants. Both sides deployed elephants and light infantry along the front of the whole line. The phalanx was in the center and cavalry on the wings. This was the standard deployment for Hellenistic armies of the Macedonian style. Seleucus remained behind the allied line with a large reserve force of elephants.

The battle began with a skirmish of elephants and light troops while the cavalry of both sides fought on each wing. Demetrius easily routed the cavalry on the allied left, commanded by Seleucus' son Antiochus I, and pursued them. Seleucus then deployed his elephant reserve to block Demetrius' cavalry and prevent him returning to the battle. While Demetrius' force was thus engaged, Seleucus and his cavalry threatened to charge the Antigonid phalanx, which was now unprotected by cavalry, to

encourage the infantry to change sides. Lysimachus, while continuing the cavalry melee on the right, sent to the center missile troops who were so numerous that their volleys forced the Antigonid phalanx to retreat in disorder. Antigonus died in the phalanx, pierced by many missiles, to the end believing Demetrius would ride in and save him. As Ptolemy had failed to appear, Seleucus and Lysimachus excluded him from the resulting division of Antigonus' territory, laying the foundation for future disputes between Seleucus and Ptolemy.

Issus, Battle of (333)

The second battle in Alexander the Great's conquest of the Persian Empire. Issus cemented the result of Granicus and caused Persian resistance in the west to crumble. The associated disintegration of the Persian fleet caused the loss of Ionia and the Asia Minor coast. The battle was fought at the Pinarus River (either the modern-day Deli Tschai or the Pajas) in eastern Cilicia in November 333. It is difficult to estimate the numbers involved as the ancient sources hugely exaggerate the size of the Persian force, but it is clear that Alexander was significantly outnumbered—and that his opponents seem to have included 30,000 Greek mercenary infantry.

Again, Arrian seems to provide the best account of the battle. Although Darius III, personally leading the Persians, surprised Alexander by appearing in his rear, he negated this by choosing a restricted area to give battle. This meant he could not take full advantage of his superior numbers

and also led to considerable overcrowding and confusion among the Persians as the battle progressed—increasing their casualties.

The Persians deployed their cavalry on the right wing (next to the sea), their mercenary infantry in the center, and their native infantry on the left wing (in the foothills). The left wing was placed to outflank Alexander's right wing. In response, Alexander put his allied Greek cavalry on the left (next to the sea), his phalanx in the center, and his Macedonian cavalry on the right. Anticipating the Persian move to outflank his right wing, Alexander countered by reinforcing the cavalry there and moving his *prodromoi* and light troops against the Persians. He provided added protection with a line of archers and light infantry at an acute angle to his main line. These maneuvers neutralized the threat from the foothills and he then moved the archers and some of the Agrianes to the front of his right wing to outflank the Persians.

In the main battle Alexander's basic tactic was to dislocate the enemy by the speed of his attack. Once in Persian missile-range, Alexander had his right wing charge across the river, driving the Persians back. However, this opened a dangerous gap in the Macedonian phalanx in the center and on the left wing the outnumbered Greek cavalry were steadily forced back by their Persian opponents.

The gap in the phalanx was penetrated by the Greek mercenary infantry and could have resulted in the defeat of the Macedonians. However, Alexander held his nerve and continued to press with the right wing toward Darius (see illustration in Alexander III (the Great) of Macedon, Invasion of Persian Empire entry). When he fled, Persian resistance began to collapse and the victorious right wing moved back against the Greek mercenaries and relieved the pressure on the phalanx. The Persian cavalry on the left only withdrew when they saw Darius and the Greek mercenaries beaten. The Persians suffered many casualties; Alexander lost 500 men.

Isthmus of Corinth

The Isthmus of Corinth, or "neck" of Corinth, refers to the narrow land bridge that separates the Peloponnese from the rest of mainland Greece. The narrow stretch of land divides the Gulf of Corinth, to the northwest of the Isthmus, from the Saronic Gulf to the southeast, and is roughly four miles wide at its narrowest point. The area was of great importance, both militarily and commercially. Corinth had a harbor on each of the gulfs, and as early as the sixth century (perhaps under Periander) had built the *diolkos*, a slipway for dragging ships from one sea to the other, avoiding the dangerous journey around the Peloponnese. The *diolkos* remained in use until Roman times. Herodotus and Thucydides make many mentions of the Isthmus as a key choke point and as a gathering point for Sparta's allies, for example, before invasions of Attica during the Second Peloponnesian War (431–404). During the Persian War of 480–479 the Peloponnesians fortified the isthmus to prevent the Persians from entering the Peloponnese. In the first century CE, the Roman emperor Nero tried, unsuccessfully, to dig a canal through the isthmus. A canal was finally built in the late nineteenth century.

Italy, Greek Cities in

The Greek colonization of southern Italy (in the region known as Magna Graecia) and Sicily began in earnest during the eighth century, coinciding with a time when many of the native inhabitants of the Italian Peninsula became self-identifying polities, trade was flourishing within Italy and across both the Tyrrhenian and Ionian Seas, and with the growth of urbanization. As elsewhere, Greek colonies provided an environment for the development of a direct relationship between Greek culture and the myriad of local cultures they encountered.

The first Greek settlements in Italy were founded by colonists from Euboea, specifically from the cities of Chalcis and Eretria, who established a colony at Pithecusae on the island of Ischia, and then shortly after another at Cumae on the mainland in Campania. Colonies were set up at key strategic locations, such as at Zancle (commanding the Straits of Messina) or at Lipari on the Aeolian Islands (the so-called bulwark of Sicily). The eastern shores of Sicily seem to have been colonized next, according to both historical and archaeological evidence, with important cities settled at Catania (possibly by colonists from Rhodes), Megara Hyblaea (from Megara), and Syracuse (from Corinth) during the middle of the eighth century. Within the “heel” of Italy colonies were swiftly founded in the last decades of the eighth century, including Rhegium, Sybaris, Croton, Metapontum, and the Spartan colony of Taras (Tarentum).

During the late seventh and early sixth centuries secondary colonies were established by some of the prominent cities from the first wave. Zancle founded Himera in northern Sicily, Megara Hyblaea settled Selinus in southern Sicily in 650; Gela colonized the important site of Agragas (Agrigento) in 580, and Poseidonia (Paestum) was founded by settlers from Sybaris. Fresh colonists, fleeing from Persian domination of the Ionian cities after the failure of the Ionian Revolt, populated these Italian cities during the sixth century settling sites such as Velia, the Dicearchia, and Neapolis.

Sites were initially settled with an emphasis on trade and commerce, such as at Pithecusae, located remotely but near important sources of materials or on strategic maritime trade routes. These colonies generally had peaceful relations with the local Italian peoples, and the archaeological evidence from these sites indicates a degree of synthesis between local and foreign cultures. Nonetheless, some colonies were founded as a result of demographic pressures in the colonizing city and were situated to exploit

land and territory at the expense of the Italians. Large-scale land-use planning is evident around ancient Metapontum, with carefully arranged orthogonal roads and plots. It seems no coincidence that Metapontum's coinage features ears of corn. The Greeks seemed to have been checked only by the increasingly organized and migratory Italian peoples (such as the nascent Samnite Leagues) of the inland, the established Etruscan sites to the north, and the Phoenician colonies of the western islands (the tip of Sicily and the islands of Sardinia and Corsica). Internal dissension between the Greek cities in Italy was not uncommon, as shown by the utter destruction of Sybaris by its rival Croton in 510, whose forces diverted a river to cover the site completely.

Cumae, as one of the oldest Greek cities in Italy, held a preeminent position among its peers, asserting dominance over the nearby cities of Dicearchia and Neapolis, and beyond Campania to Zancle. Cumaean forces, with aid from Syracuse, successfully kept Etruscan influence from Campania: in 474, Cumae and Syracuse combined to defeat the Etruscans in a naval battle off Cumae. However, by around 421 Cumae had been conquered by Oscans. A similar story repeated throughout the Greek cities in Italy during the end of the fifth century and fourth century, as many of these sites were conquered by the local Italians, abandoned due to disease, or fell to Syracusan expansionism under its tyrants. Poseidonia flourished, before being besieged and captured by the Lucanians in around 390. Rhegium was destroyed and razed by Syracuse in 387. Taras was one of the last remaining independent Greek cities of Italy, and rose to prominence during the fourth century, yet was still unable to resist the Italians without external assistance. The Spartans under King Archidamus II assisted in 338, followed by Alexander I of Epirus in 334. In 282, the Tarentines enlisted Pyrrhus of Epirus to resist Roman interests, but after sustaining considerable losses he quit Italy in 275 and left Taras to have its walls demolished and its population enslaved by the Romans in 272. The Pyrrhic and Punic Wars continued what the Italians had started, and the Romans completed their dominance over both mainland Italy and Sicily in the third century.

Italy, Italians

The peninsula of Italy was well known to the Greeks, who had begun to settle along its southern coastlines during the ninth and eighth centuries. These colonies varied considerably in both size and intent: some were for the resettlement of populations, such as Paestum, Cumae, or Brundisium, while others, such as Pithecusae in southern Italy, were predominantly for trade with the Italians.

From this time, until the fifth century, Italy was a patchwork of various Iron Age cultures, languages, and peoples, who were variously influenced by the introduction of language and material culture by the colonizing Greeks. The Celts dominated the northern river plains, while further south were the Etruscans and the Oscan-Umbrians, the Latins in the Tiber valley, the Samnites in the Apennines and the Mesapians along the east coast. Some, such as the Faliscans, had legendary foundation myths that emphasized their Greek origins.

The Greek colony of Cumae, established in the mid-eighth century, began a flourishing trade with the Etruscans who entered the plain of Campania during the same period. Mixed populations are indicated by the survival of a small Greek sanctuary with offerings to Apollo, Hera, and Demeter at Etruscan sites. Trade was predominantly in the outputs of the rich mines of the Apennines; however, interest in this began to decline during the sixth century, as mines in Attica (at Laurium) and Spain began to compete.

Political upheavals in the cities of Magna Graecia were coupled with weakened Etruscan power during the fifth century, and migrations of the inland peoples of Italy. Dominant amongst these were the Samnites, a term used by Greek and Roman authors to cover a number of autonomous groups occupying the eastern slopes of the Apennines down to the Adriatic coast. These peoples spread throughout central and southern Italy at this time, placing pressure on the Greek cities of the coast, and in turn becoming more Hellenized. Greek influence is apparent in their religious beliefs in the afterlife: “warrior” burials (with arms and armor won from conflicts with the Greek cities) and the placing of coins in the mouth of the deceased both become more popular.

In 473, Tarentum—preeminent amongst the cities of Magna Graecia—allied with Rhegium to combat the growing menace of the inland Italic peoples, but they were decisively defeated at the battle of Kailia (modern Ceglie). Again in 466, Tarentum was defeated, causing internal unrest within the rulers of the city. After ongoing interference by the kings of Epirus, by 330, the Greek cities were willing to ally themselves with the Italians against the nascent power of Rome.

J

Jason of Pherae (d. 370)

Jason, tyrant of Pherae, a city in southeastern Thessaly, was able to extend his power over the whole of Thessaly and for a short time was the most powerful man in northern Greece. Nothing is known about Jason's early career, but in the early 370s he was intervening in the affairs of Euboea. By 375, he had extended his power over most of Thessaly, while also controlling much of central and western Greece. His power was built on 6,000 mercenary soldiers. The final stronghold of local opposition was the Thessalian city of Pharsalus, whose leader Polydamas in 375 sought help from Sparta. But the Spartans, already stretched by war with other Peloponnesians and with Athens, could not assist, and Pharsalus went over to Jason. Jason took on the title of *tagos* (commander-in-chief), evidently marketing this as a traditional title for the leader of Thessaly, and now had at his command 8,000 cavalry, 20,000 hoplites, and a large number of light-armed troops.

In 371, Jason made a forced march south into Boeotia after the battle of Leuctra, but dissuaded his Theban allies from risking a second battle with the defeated Spartan army. Instead he brokered an agreement allowing the Spartans to withdraw, then on his way home ravaged parts of Phocis and dismantled the walls of Heraclea in Trachis. This was the high point of his power. The following year he planned to preside over the Pythian Games at Delphi, and ordered his allies to supply a vast number of sacrificial animals for the festival. His intentions remain unclear, and before his plans came to fruition he was assassinated. After a brief period of turmoil, he was succeeded by Alexander of Pherae, who cemented his position by marrying Jason's daughter.

Judaea, Jews

The main source for the early history of the Jews up to the Greek period is the Hebrew Bible. Scholars have debated fiercely the extent to which it can be used for historical purposes, but most historians would agree that it provides useful contextual information, which can be supplemented by secular texts and a well-sifted archaeological record.

The kingdom of Israel first appears in the Egyptian records in a late-thirteenth-century victory inscription of Merneptah. Arguably, the most successful period in the history of the Jews was the reigns of David and Solomon (after about 1010). David's famous adversary, Goliath, was the champion of the Philistines, who as many would argue were of Aegean origin (1 *Samuel*, 17). From this time, the Jewish kings were regularly involved in warfare. Israelite and Judahite forces relied heavily on their slingers. The Syrians and Moabites inflicted major damage on Israel (the northern kingdom) in the ninth century. In the early eighth century, under Jeroboam II, Israel had rejuvenated and became strong briefly, before the Assyrians destroyed it in 721. Under Hezekiah, the army of Judah (the Jewish kingdom in the south) expanded, but foolishly provoked mighty Assyria. *Kings*, *Chronicles*, and *Isaiah* as well as Assyrian sources document the consequent nemesis: the victory of Sennacherib and the destruction of most of Judah around 700.

In effect, the Jews were largely peripheral to the Greek world until the Hellenistic Period, but this is not to say that there was no interaction. There was certainly trade and it is widely accepted that Greeks (perhaps known in some early Jewish texts as “Kittim”) were employed as mercenaries. They

garrisoned the fort of Mesad Hashavyahu during Josiah's reign (late 600s). The Classical Greeks knew Israel and Judah as territories under Assyrian control and then as part of Persia, before Alexander conquered the Levant and Egypt.

The first major Jewish diaspora had been triggered as early as 587–586, when the Babylonian, Nebuchadnezzar, sacked Jerusalem and removed its elite to Mesopotamia. Even when they were allowed to return in 538 by the Persian king, Cyrus, some Jews chose to remain. Other displaced or enterprising Jews over the ages established large enclaves in cities in Cyrenaica, Lydia, Egypt, and, eventually, in lands across the Mediterranean. After the “Babylonian Exile,” the many Jews who did choose to return to Jerusalem built the Second Temple, ca. 520–515. By 445, Nehemiah had restored the walls of the city.

After Alexander, Judah and Israel were ruled by the Ptolemies and then, by 200, fell under Seleucid control. During the reign of Antiochus IV, there were ill-conceived efforts to Hellenize Jerusalem. Judaism was suppressed and the Temple was even reconsecrated to Zeus in 167. This sparked the Maccabean Revolt, which, eventually, saw Judaea granted independence by Demetrius II Nicator in 140. The Jews were able to retain their independence for about 80 years until Pompey captured Jerusalem for Rome in 63. The Romano-Jewish historian Flavius Josephus is the main source for the Hellenistic and early Roman periods.

Justin/Pompeius Trogus

Justin (in full, Marcus Justinianus Justinus) produced a surviving epitome

(condensed version) in 44 books of the lost *Philippic History* of Pompeius Trogus, who lived ca. 30 BCE–20 CE. Both works are in Latin. Justin's date is uncertain: it has been placed at various points in 100–400 CE.

The *Philippic History* covers the world known to classical antiquity from the earliest times down to the first century BCE, with the peculiar feature of ignoring Roman history, apart from the regal period, except in so far as it impinged on the Greek world. The title derives from that of the fourth century Greek Theopompus' historical work centered on the reign of Philip II of Macedon (359–338). The ignoring of Rome appears to be due to Hellenizing cultural affectation.

The narrative in Justin is often so condensed as to be difficult to follow and errors abound. Justin also had a liking for sensational or melodramatic episodes. However, his work is, for all its faults, at times the only connected narrative available, especially for parts of the Hellenistic Period.

King's Peace (387/6)

Also known as the Peace of Antalcidas after the Spartiate admiral (*nauarchos*) who had worked on negotiating it since 392, this “Common Peace” of 387/6 between the Greeks and the Persian king Artaxerxes II ended the Corinthian War. The treaty stipulated that the Greek *poleis* of Anatolia, Clazomenae, and Cyprus would pay taxes and obey commands rendered by the king or his agents, ending the autonomy won for them a century earlier in the Persian Wars. In exchange, it promised autonomy for the Greeks; this, when selectively applied by Sparta, meant the dissolution of the Boeotian League, the innovative Argos-Corinth union (with Corinth rejoining the Peloponnesian League), Arcadian Mantinea, and the Chalcidian Confederacy. As a concession, the Athenians were allowed to keep their cleruchies (military colonies) at Lemnos, Imbros, and Scyros. Sparta was to police the arrangement, and all signatories were bound to assist the king against anyone breaking the stipulations. The treaty was inscribed and set up on pillars and temples in Greek cities. The treaty was extraordinarily controversial and caused the Spartan state to be regarded as traitors to the Greeks. Some sources suggest Spartan regret over this and a desire to liberate the Greeks of Anatolia again. The idea of a Common Peace lasted longer than the actual peace of this treaty.

L

Lade, Battle of (494)

Lade, a small island off the coast of Miletus, was the site of the final major battle in the Ionian Revolt (499–493). When the Persians attempted to recover Miletus with a land and sea attack the Ionians decided to send a fleet to help, but let Miletus defend itself on land. The Ionian fleet was 353 triremes, with most coming from Chios (100 ships), Miletus (80 ships), Lesbos (70 ships), and Samos (60 ships). The Persian fleet, raised from Phoenicia, Cyprus, Cilicia, and Egypt, was 600 strong. Although his city had supplied only three ships, Dionysius of Phocaea persuaded the Ionians to adopt a strenuous training program to prepare for battle. The fleet kept it up for a week before it was abandoned as too onerous. This provided the impetus for the large Samian contingent to agree to a Persian offer to defect.

Herodotus records that all but 11 of the Samian ships deserted at the start of the battle, starting a chain reaction of flight in other contingents. The Chians apparently performed well, using the *diekplous* maneuver against the enemy and causing significant losses. Despite this, the Persian numerical superiority and the flow of desertions delivered a Persian victory. Without naval support, Miletus was soon taken and the Ionian Revolt effectively ended.

Lamachus (d. 414)

Lamachus was an Athenian general (*strategos*) during the Peloponnesian War of 431–404. A signatory of the Peace of Nicias in 421, in 415 Lamachus was chosen alongside Nicias and Alcibiades to command the ill-fated Sicilian expedition—however, his relative poverty and lack of status gave him less influence than his colleagues.

According to Thucydides, Lamachus' advice was to sail straight to Syracuse and fight there, taking advantage of the panic the large Athenian force would inevitably create. Nicias' plan was to focus on Selinus and then sail home after a show of force, while Alcibiades advocated making local alliances, establishing a base at Messana, and then building up to attack Selinus and Syracuse. Unable to convince the others to adopt his plan, Lamachus supported Alcibiades. If Thucydides' account is accurate—and he is not just using Lamachus to convey a better alternative option—it is evidence of Lamachus' military ability. His plan probably offered the best chance of success, and certainly recognized that Syracuse was the center of gravity for the expedition.

Unfortunately for Athens, after Alcibiades' departure, Lamachus was killed in a skirmish, leaving the over-cautious (and ill) Nicias to lead the expedition to defeat. Lamachus appears in Aristophanes' *Acharnians* as an inveterate warrior, devoted to warfare, although after his death Aristophanes' *Frogs* pays tribute to him.

Lamian War (323–322)

Causes

The Lamian War, a conflict that saw an Athenian-led coalition under Leosthenes defeated by Antipater and the Macedonians, permanently curtailed the power and autonomy of Athens, and marked the final end of the *polis* as the dominant political institution in the Greek world.

After Alexander the Great's death in June 323, an Athenian "nationalist" faction—that included, at various times, the orators Demosthenes, Lycurgus, Charidemus, Hyperides, Ctesiphon, Ephialtes, and Polyeuctus—saw an opportunity to restore Athenian political prestige and independence constrained since the battle of Chaeronea in 338. The name of the war itself is problematic. Epigraphic evidence suggests the Lamian War was known alternatively as the "Hellenic War" in antiquity, and this was the favored term of reference for the Athenians, for obvious propagandistic reasons. Hieronymus of Cardia was the first to use the expression "Lamian War" and this was followed by Diodorus who provides the most complete surviving source for the war.

Course

The Athenians began to mobilize immediately upon hearing the first reports of Alexander's death, and, despite the concerns raised by Phocion, Athens appointed Leosthenes *strategos* and authorized him to raise a mercenary army of 30,000 men at Taenarum, financed with a portion of Harpalus' looted treasure. In 324, Harpalus had fled Asia ahead of Alexander's return from India and made off with the sizable sum of 5,000 talents of silver, 30 ships, and 6,000 mercenaries. The Athenians appear to have achieved some limited early military success against Antipater's force of only 13,000 infantry and 600 horsemen. However, despite a victory in Boeotia and the occupation of Thermopylae, the Athenians were unable to force a decisive battle with Antipater, who withdrew to a heavily fortified position at Lamia, in Malis in central Greece. Diodorus' account suggests that Antipater may well have planned to occupy Lamia even before the conflict began. The

initial successes earned the Athenians some support among the Peloponnesian states. There was the possibility of a genuinely Hellenic revolt, perhaps much broader than the one that had been led by Agis III in 331 (but which Athenian abstention had undermined).

The Athenian siege of Antipater's Macedonian forces in Lamia formed the central action of the war on land during the winter of 323/2. However, a combination of two significant defeats at sea and the increasing futility of the Lamian siege strained the Greek coalition and prevented any further Greek rebellions in favor of the allies. The siege itself lasted nearly four months, from November 323 to February 322. Confronted with this prolonged siege and mounting casualties, Leosthenes was unable to preserve the unity of the Greek cause. Even worse for the allies, he was killed in a skirmish below Lamia, but was eulogized by Hyperides in a fashion befitting the greatest of Greek heroes. Although remembered as a heroic, albeit tragic figure, his reputation may ultimately owe more to the quality of his funeral oration than to his own achievements. He was unable to conclude the siege and draw Antipater into the critical battle that would have allowed the Greeks to exploit the military advantage they held in 323. This failure left Athens isolated and vulnerable in the spring of the following year. In May/June 322 the Greek fleet suffered a major loss to Cleitus at Amorgos—Athens alone lost 170 ships—and a later defeat in the Malian gulf effectively ended the naval war and Athens' place as a major sea power.

While the Greek army and alliance were continually weakened by the siege, Antipater awaited reinforcement. At the outset of hostilities he had summoned assistance from the Macedonian generals Leonnatus and Craterus. The arrival of Leonnatus and his army in spring proved decisive. Although Leonnatus was killed in an ensuing battle, the siege of Lamia was ended and Antipater united the two Macedonian armies. Craterus, arriving later, conceded the command of his 10,000 Macedonian veterans to Antipater. With this combined force, Antipater readily defeated the Greeks in battle at Crannon, on September 5, 322.

Consequences

The individual Greek states that had revolted were forced to come to terms individually with Antipater. Athens, isolated and faced with the prospect of a Macedonian siege, accepted Antipater's terms for peace along with the

imposition of significant constitutional change. Antipater ended Athenian democracy by reducing the franchise and depriving all citizens whose property was valued at less than 2,000 drachmae of their civic rights. He installed a garrison at Munychia and demanded the surrender of the orators Demosthenes and Hyperides. Hyperides, who had been instrumental in stirring up support for the war, met a particularly grisly end. Plutarch records that Demosthenes, having taken refuge in the temple of Poseidon on the island of Calauria, swallowed poison that he had concealed in a pen rather than fall into Antipater's hands.

Laws of War

The question of whether the ancient Greeks had "Laws of War" to regulate the way they waged war is closely linked to how the Greek states interacted with each other and whether they had any form of international law. However, it should be stated at the start that there was nothing in ancient Greece like the modern Geneva Convention, nor any sort of international court or international body to enforce (or attempt to enforce) its rulings. This is not surprising, as inter-state relations were generally not conducted on a formal level as they are today with diplomatic corps, embassies and ambassadors, and systems of treaties.

However, there was a system of interstate relations, built around

proxenoi (closest perhaps to the modern honorary consul). These were citizens who had a hereditary family link to another state and provided a low level of representation for them, including hosting visiting envoys. This was part of the general belief that Greeks were bound together by a common language and culture. Despite warfare and issues between Greek states, the common bond was seen as marking Greeks out from *barbaroi* (non-Greek speaking foreigners). Part of this belief of “Greekness” was a view that certain behaviors were contrary to nature or custom (sometimes referred to as the “laws of the Hellenes”) and therefore unacceptable even in war. As noted, there was no means of enforcing this—other than individual states, or sometimes formal groups (such as the Delphic Amphictyony or the Hellenic League) imposing punishments on the transgressor. These punishments, were, of course, only as good as the ability of the state or group imposing them to enforce them. In essence, the gods were relied on to punish transgressions of the “laws of the Hellenes.”

The situation was further complicated as wars against *barbaroi* were seen as outside this system. In addition, the Greeks could wage war against each other in the form of *polemos akeryktos* (lit. “war without herald”) or *polemos aspondos* (lit. “war without truce”). This basically meant that the rules did not apply—rather like the medieval French practice of raising the *Oriflamme* standard to indicate that contrary to normal usage no prisoners would be taken. The origin of this was presumably that if a state attacked without a formal declaration of war (delivered by a *keryx* or herald) their enraged opponents believed they could retaliate any way they wished. The American outrage at the Japanese attack on Pearl Harbor in 1941 without a declaration of war shows the high level of emotions caused by a surprise or “sneak” attack.

An example of *polemos akeryktos* is the long-running conflict between Athens and Aegina that began in the late 490s with an Aeginetan attack without a declaration of war. If there is any basis to Herodotus’ story that the Delphic Oracle instructed Athens to respond by building a sanctuary, wait 30 years, and then declare war (i.e., a formally declared conflict), it may have been Delphi’s attempt to place the conflict on a more legitimate level. In the event, the Athenians built the sanctuary but did not wait for 30 years and the war that followed was basically one of surprise attacks, raids, and a few atrocities by both sides.

The mere existence of *polemos akeryktos* demonstrates that the opposite

existed—a war fought (or at least started) by some sort of rules. However, there is no codified version of the “laws of the Hellenes.” The elements have to be recreated from scattered references, often complaints that someone has breached them. A further complication is that there was a tendency in the fourth century and later to look back at earlier periods of Greek warfare as almost a golden age of gentlemanly behavior. An example of this is Demosthenes’ criticism that “Philip [II of Macedon] marches wherever he wants, not with a hoplite phalanx but with *psiloi* (light infantry), cavalry, archers, and mercenaries” (Document 19). The best it is therefore possible to achieve is to identify a list of what was generally seen as unacceptable, noting that different parts were no doubt emphasized more at different times and in different parts of Greece.

With the exception of the almost certainly fictional agreement to ban missile weapons in the Lelantine War (ca. 700), most of the “Laws of War” referred to (or implied) in our sources unsurprisingly overlap with general ideas of civilized behavior. These include the inviolability of heralds (who conveyed requests and demands between the combatants) and sanctuaries, the duty of the victors to return the enemy bodies for burial, not to mistreat the corpses, and to treat prisoners humanely. All combatants were supposed to abide by agreements and oaths.

As noted, much of our evidence for these comes from complaints that a particular usage had been breached. For example, after the battle of Delium (424) the victorious Boeotians refused to follow the normal procedure and return the Athenian dead on the grounds that the Athenians had, contrary to custom, occupied a Boeotian temple—and were still in possession of it. The Athenians countered that they had done nothing the gods would not excuse. The basis of the story of *Antigone* is the refusal to bury the body of a prince of Thebes (Antigone’s brother) who had attacked his own city—and Antigone’s strong belief that it was her duty to provide the proper funeral even at the risk of her own death.

After the Persian defeat at Plataea (479), Lampon of Aegina suggested Pausanias should mutilate the corpse of Mardonius, the Persian commander, in revenge for Persian mistreatment of Leonidas’ corpse after Thermopylae (480). Pausanias rejected this, stating “...you cast me down to the depths by suggesting I abuse a corpse and telling me if I do I shall improve my renown. But to do these things is better for *barbaroi* (foreigners) than Greeks—and is hateful even for them.” (Herodotus 9.79.1). In 427, the

Athenian Paches illustrated the importance of keeping one's word in war—and demonstrating that a clever general could find a way around it. At Colophon he lured the enemy commander out to talk, promising not to harm him and if they failed to agree, to return him safe inside. He then seized him, carefully not putting him in restraints, captured the fort with a surprise attack, brought him safely inside, and then killed him.

There are numerous examples of the mistreatment of prisoners, especially in the Second Peloponnesian War (431–404), ranging from the harsh conditions endured by Athenians captured at Syracuse to the latter stages of the naval war when Athenians sometimes cut off the right hands of captured ships' crews, or threw them overboard, and the tit-for-tat Peloponnesian reaction to this. Interestingly, and perhaps somewhat ironically, after the victory at Aegospotami (405) Lysander asked his prisoner Philocles, the Athenian responsible for throwing the crews of two triremes into the sea, "what he ought to suffer for having been the first to treat his fellow Greeks contrary to the law"—and then had him killed (Xenophon, *Hellenica* 2.1.32).

There is another element to the question of "Laws of War"—the extent to which hoplite warfare itself was fought as a contest (*agōn*) with a set of procedural rules. Those who support the view of hoplite warfare as having an agonal nature generally see this as a means of restricting casualties among citizen soldiers who were predominantly farmers when not involved in a campaign. In this view, the hoplite phalanxes drew up, completed the prebattle sacrifices and rituals, and fought it out man to man. After the battle the victor set up a trophy and returned the enemy dead under truce. It was short, contained, and many campaigns were effectively resolved in one pitched battle.

Perhaps the clearest representation of this is Herodotus' story (Document 4) of Mardonius' critique of hoplite warfare as being a contest fought on level ground with no skill or maneuver and heavy casualties. Although this perhaps has a strong element of truth for early hoplite warfare, it certainly did not apply to the way the Greeks used the terrain at Thermopylae and Plataea and is certainly greatly oversimplified from the Second Peloponnesian War on. This does not mean that hoplite warfare did not originally have the effect of containing the results of conflict or have an agonal flavor. However, under the pressure of major and complex wars, Greek warfare certainly became more complex and more sophisticated. The

hoplite clash remained for many years the centerpiece of combat, but increasing use of light troops, archers, and cavalry inevitably eroded the older style agonal conflict. Greeks always fought to win, but over time, warfare became more complex and those involved saw, perhaps erroneously, the relative simplicity of earlier combat as a more honorable form.

The belief in the “laws of the Hellenes” that also applied to warfare was relatively widespread in ancient Greece. However, as in much of modern combat, the rules were not always (and in some cases not often) followed. Although they provided a basic framework for the conduct of war, there was no international court or body to enforce them, other than the court of public opinion, and they were often breached, or broken down under the stresses of combat. There could be a fine line between keeping one’s word and stratagems to deceive the enemy, and as Philocles discovered, one atrocity easily leads to another.

Lechaeum, Battle of (390)

A Spartan defeat near Corinth during the Corinthian War. It is significant

for the use of peltasts and its psychological and propaganda results. Xenophon provides a detailed account of the action.

The battle was essentially a large ambush—sprung by the Athenian Iphicrates on a force of 600 Spartan hoplites. The Spartan *mora* (regiment) with a cavalry contingent was escorting Spartan troops from Amyclae returning home to celebrate a religious festival. Just short of Sicyon the infantry contingent turned back leaving the cavalry to complete the escort task and then catch up. The Athenians ambushed them with a mixed force of peltasts and hoplites. Iphicrates' peltasts harried the Spartans with javelins while the hoplite phalanx kept back, but apparently close enough to prevent the Spartans adopting an open formation. The Spartans sent out groups (*ekdromoi*) to drive the peltasts back but they were unable to catch them and lost men to javelins when returning. When their cavalry support arrived it was misused and proved ineffective. The Spartans finally retired to a hill where the *mora* broke; about 250 were killed. The psychological boost to the allies led to considerable local successes.

Lechaeum is a good illustration of the weakness of unsupported hoplites against a combination of well-handled light troops.

Lelantine War

The Lelantine War was a shadowy, and probably largely mythical conflict between the two major cities of Euboea, Chalcis and Eretria. It takes its name from the Lelantine Plain, a fertile agricultural plain between the two cities (though closer to Chalcis), over control of which the war was supposedly fought. Thucydides, writing in the fifth century, comments (1.15) that it was in the “war which took place at some point in earlier times

between the Chalcidians and the Eretrians that the rest of the Greek world was in alliance with one side or the other.” Modern historians have gathered fragmentary pieces of evidence, drawn from sources written between the seventh century BCE and the second century CE, of friendships, alliances, and enmities, to try to assemble a list of the allies on each side. According to these theories, Chalcis’ allies included Samos, Corinth, and its colonies, Thessaly, Athens, Sparta, Erythrae, and some of Chalcis’ own colonies, while Eretria was supported by Miletus, Megara, Boeotia, Aegina, Argos, Chios, and Mytilene (forming a series of pairs of neighbors who were often in conflict nearer to home).

These theories are inherently implausible. The war is generally dated to the late eighth or early seventh century, when such large-scale alliances are quite unlikely. Aristocrats in one city might well support their aristocratic guest-friends (*xenoi*) in another (in the sixth century Peisistratus used such connections to gain and maintain power in Athens), and perhaps such support in a local conflict is at the heart of the story. Some historians have connected the abandonment of Lefkandi (on a site midway between the two cities) as a consequence of the war, but there is no direct evidence. A fragment of the seventh century poet Archilochus comments that the lords (*despotai*) of Euboea fight on the plain, not with bow or sling but with swords and spears. Some have linked this with the development of hoplite warfare. Writing late in the first century Strabo claims to have seen an inscription in Euboea banning the use of ranged weapons such as slings, arrows, and javelins. If such an inscription did exist, it was set up long after the supposed date of the war, but may reflect local traditions about the style of war favored in Euboea.

Lemnos, Imbros, and Scyros

Three islands in the Aegean, of particular importance to Athens. Lemnos had been noted in the *Iliad* as a rich source of wine. Along with Imbros, in the sixth century it was absorbed into the Persian (Achaemenid) Empire by Otanes, the general of Darius I, before being taken by the Athenian Miltiades II. After the Persian War, the islands became part of the Athenian Empire. Scyros was seized from the resident Dolopians by the Athenian general Cimon around 475, and all three islands became closely held Athenian possessions. On all three Athens set up cleruchies, settlements in which the colonists maintained their Athenian citizenship, probably because they were vital ports for securing the Athenian grain supply from the Black Sea, as well as producing grain themselves.

This status ceased with Athens' defeat at the end of the Peloponnesian War in 404, although the three islands were reformed as cleruchies in the fourth century (ca. 393). Later in the fourth century they passed into Macedonian hands under Phillip II, still later were controlled by various Hellenistic rulers, and eventually came under Roman rule in the mid-second century.

Leonidas (d. 480)

Leonidas I, son of Anaxandridas II, was a member of the Agiad royal family at Sparta. He led the Greeks to a glorious defeat at the battle of Thermopylae (480), while opposing the Persian advance in the Second Persian War (480–479).

According to Herodotus, Anaxandridas was under pressure to divorce his childless wife and take another to ensure he had an heir. He refused and was allowed to take a second wife without divorcing his first. Shortly after his new wife had a son (Cleomenes I), Anaxandridas' first wife also had a son, Dorieus, and then another, Leonidas. As Cleomenes was the heir, Dorieus and Leonidas underwent the *agoge* (the Spartan state training system), from which royal heirs were exempt. Dorieus was killed in Sicily but Leonidas remained in Sparta and married Cleomenes' daughter Gorgo. Leonidas became the Agiad king in 490 on the disgrace and death of Cleomenes.

Marble bust, fifth century, from the Temple of Athena of the Bronze House, Sparta. Although often identified as King Leonidas who led the Spartans at Thermopylae, the only support for this seems to be the elaborately decorated cheek pieces possibly indicating a royal owner. Located in the Archaeological Museum, Sparta, Greece. (De Agostini Picture Library/Getty Images)

To counter Xerxes' invasion of Greece, the Greeks established the Thermopylae/Artemisium defensive line in Malis. Leonidas commanded the small land force (7,000 soldiers from the Peloponnese, Boeotia, Phocis, and Locris) sent to Thermopylae, operating in conjunction with the fleet at Artemisium. The Spartan contribution was only 300 men—possibly the *hippeis*, or king's bodyguard. Despite this, it is highly unlikely that the Spartans saw Leonidas' task as a suicide mission. The Spartans were conscious of their military prowess, the Athenians (not noted for land warfare) had decisively beaten the Persians at Marathon 10 years earlier, and the pass at Thermopylae was, in antiquity, very narrow—which would negate Persian numerical superiority. The size of the Spartan force may have been influenced more by overconfidence than caution.

Leonidas occupied the pass at Thermopylae, further strengthening it with a low wall. His left flank was secured by mountains, the right by the sea. When Leonidas learned of a mountain trail (the Anopaeon track) that could be used to outflank his main position, he placed the Phocians to secure it. In short, he did everything a competent commander could be expected to do to prepare. When Xerxes demanded that the Greeks surrender their arms to him, Leonidas is reputed to have said "*labe molon*" ("come and get them," Plutarch, *Moralia* 225) and the Greeks inflicted serious casualties on the Persians during several days of fruitless frontal attacks.

Leonidas' plan foundered when Ephialtes guided the Persians along the Anopaeon track and the Phocians failed to hold it. When Leonidas learned of the Persian threat to his rear he dismissed most of his army and fought to the bitter end with his 300 Spartans, 700 Thespians, and 400 Thebans. Given the huge disparity in numbers, the result was inevitable, but the final heroic resistance became the stuff of legend. However, in practical terms this legend helped stiffen Greek resistance, and the casualties Leonidas inflicted were heavy enough to damage Persian morale.

Leonnatus (ca. 356–322)

Leonnatus was a prominent member of Alexander the Great's army, and was among those who served as a *somatophylakes* (bodyguard) of Philip II. He was said to have been distantly related to the royal house, and a great emulator of Alexander.

He played an important role in Alexander's campaign against the Mallians, acting quickly to protect the king when Alexander was injured after leaping down from the walls while besieging the city. Leonnatus was among those who saved his life. He undertook a number of military campaigns, including a great victory over the Oreitae, and was later honored at the Susa weddings in 324—he was awarded a golden crown and a Persian bride.

After Alexander's death, Leonnatus briefly played a role in the succession, and it was proposed that he be awarded joint guardianship of Alexander's child, along with Perdiccas. However, the assembly of foot soldiers overturned this decision, voting instead for a joint rule between Alexander IV and Philip III Arrhidaeus, under the guidance of Perdiccas and a number of others. Leonnatus remained supportive of Perdiccas, was awarded the satrapy of Hellespontine Phrygia, but quickly began to work to gain a better position for himself. He designed to marry Alexander the Great's sister Cleopatra, which may have provided him with a strong claim to the Macedonian throne, but he died from wounds received while attempting to assist Antipater with an Athenian rebellion in Lamia.

Leosthenes (d. 323/2)

Leosthenes led the Athenian uprising against Macedon known as the Lamian War (323–322). His father Leosthenes had suffered exile from Athens in 362/1, and had fled to the court of Philip II to avoid prosecution for treason. It is possible that the younger Leosthenes may also have spent time at the Macedonian court, but the details of his career before 324 remain largely unknown.

Leosthenes may have been a mercenary commander under Alexander in Asia, but his intense hostility to Alexander seems to militate against this view. An alternative view is that he was actually a mercenary commander in the service of Darius. Whatever the truth, it would appear that Leosthenes was in Athens and serving as trierarch in 325/4 shortly before Alexander's death. There is some epigraphic evidence that Leosthenes was *strategos* in 324/3 when, following Alexander's death, he recruited a mercenary army at Taenarum and led the revolt against Antipater. He enjoyed some early success at the head of an Athenian-led coalition of Greek states, and besieged Antipater at Lamia. The siege was ultimately a failure, and Justin and Diodorus record that Leosthenes was killed by a missile hurled from the walls of the city during a foray launched by Antipater. After his death, the coalition disintegrated under the leadership of Antipater, and the Athenians were forced to sue for peace. Leosthenes was eulogized by Hyperides.

Leotychidas II (ca. 545–469)

Leotychidas (also Leotychides), son of Menares, joined Cleomenes I's plot against Demaratus, succeeding him as king of Sparta in 491. Prior to the Persian Wars he secured a truce between Athens and Aegina, taking hostages from the latter. However, his main claim to fame is winning the stunning victory at Mycale (479), attaining naval superiority in the Aegean and Hellespont and ending the Second Persian War.

After the Persian Wars, Leotychidas led a Hellenic League army against those in Thessaly (especially the Aleuadae) who led it to defect to Persia. He had mixed success (failing at Larissa, but perhaps succeeding at Pherae and Pagae). When he returned home, he was accused of accepting bribes from the Thessalians, went into exile in Tegea, and died there ca. 469.

Lesbos

Lesbos is the largest of the Greek islands off the coast of Anatolia, occupying an excellent strategic position for maritime routes in the northern Aegean. Its fertile soil also supported agriculture, particularly olive oil production.

Lesbos was occupied from about 3300. Bronze Age remains show a strong mercantile relationship with Troy. Homer has both Achilles and

Odysseus attack the island. In the tenth century, Aeolian Greeks planted themselves on Lesbos. Five cities were established on the island: Mytilene (the strongest), Methymna (Mytilene's main rival), Eresus, Pyrrha, and Antissa. By the Archaic Period, Lesbian cities started colonizing the Troad. Colonial interests brought Mytilene into conflict with Athens, for example over control of Sigeum.

Lesbos emerged as a significant cultural and political power in the Greek world during the late seventh and early sixth centuries. After earlier oligarchies, from the early sixth century there was a period of tyranny. Civil strife saw the islanders turn to Pittacus, one of the "seven sages," as an *aisymnetes* (intermediary with governing power) in Mytilene to restore order. In this period important buildings were constructed and the island's arts and sciences flourished, with education encouraged and a relative degree of freedom achieved by women. Famous residents on Lesbos were the musician, Terpander; the poets, Arion, Alcaeus, and Sappho; and the philosophers, Theophrastus, Epicurus, Aristotle, and Cratippus.

By 527, Lesbos had come under Persian control. It participated in both Cambyses' campaign against Egypt and Darius' against the Scythians. In 499, Mytilene rebelled against Persia and took part in the failed Ionian Revolt, but was retaken by the Persian fleet in 493. It did not free itself until it allied with Athens in 479. While most of Athens' allies, over time, gave up their own fleets and contributed levies rather than ships to the Delian League, Lesbos, and Chios were the two islands to retain strong independent navies.

The persistent rivalry between Mytilene and Methymna gave outside powers the opportunity to use local politics to get a foothold on the island. This was most apparent during the Second Peloponnesian War: when Mytilene went over to Sparta in 428, it was betrayed by Methymna. After the surrender of its *demos* to the Athenians, Mytilene suffered punitive measures such as the loss of its fleet and destruction of its fortifications and settlement of its land by Athenian cleruchs. An order to massacre its men and enslave its women and children was only avoided by a late change of mind and the dispatch of a second Athenian ship to reverse it. It is not surprising, therefore, to see Mytilene trying again to leave the Delian League in 412–411. In 405, Lesbos fell to Sparta.

During the fourth century, Mytilene actually became a strong and consistent supporter of Athens and member of the Second Athenian

Confederacy. In 333, Lesbos and other islands were taken by Memnon, a brilliant Rhodian general, who assisted the Persians against Philip, but it was soon retaken by the Macedonians. The island changed hands among Persia, Macedon, and the Ptolemies, until Mithridates took it around 88.

Leucimne, Battle of (435)

The initial naval battle of the dispute between Corinth and Corcyra over Epidamnus. The battle was fought when Corinth sent a fleet to support Epidamnus against oligarchic exiles. The Corcyraeans regarded this as interference in their sphere of influence (Epidamnus was their colony) and lent their support to the exiles. The Corcyraeans won, sinking 15 Corinthian ships, and erected a trophy at Cape Leucimne. Epidamnus surrendered the same day and the Corcyraeans killed all their prisoners except for the Corinthians.

The Corcyraeans aggressively followed up their victory, dominating the western Greek coast. However, major Corinthian preparations for a counter attack prompted the Corcyraeans to make an alliance with a reluctant Athens. This led to Athenian involvement in the battle of Sybota between Corcyra and Corinth, contributing to the outbreak of the Peloponnesian War.

Leuctra, Battle of (371)

A battle fought in Boeotia between Thebes and the Peloponnesian League near the small town of Leuctra, southwest of Thebes, near Thespieae. The battle was a decisive Theban victory and permanently ended Sparta's military power in Greece. Sparta precipitated the battle by insisting that Thebes could not sign the restatement of the King's Peace on behalf of the Boeotian League.

When Thebes refused, King Cleombrotus I led a Peloponnesian League army of 10,000 infantry and 1,000 cavalry into Boeotia. The course of the battle, unfortunately, has to be reconstructed from several sources, which do not always agree. Xenophon's contemporary account glosses over the details, Diodorus Siculus' much later description has several obvious mistakes and elements of stock battle descriptions, and Plutarch focuses on the Theban Pelopidas, who was not overall Theban commander.

The unusual Theban memorial to their victory at Leuctra consisted of a round tower surmounted by a ring of nine hoplite shields in relief. The monument has been reconstructed in modern times on the basis of the masonry pieces found around the site. Permanent trophies became more common from the late fifth century and probably indicated, as in the case of Leuctra, that the winners saw their victory as particularly significant. (Photo by Peter Londey)

However, it seems likely that the events unfolded along the following lines. Although outnumbered (only 6,000 strong according to Diodorus Siculus), Theban morale was good. Both sides were apparently determined to fight: the Thebans to defend their homes and preserve the Boeotian League, Cleombrotus to counter rumors he was pro-Theban. Further spurred on by alcohol, Cleombrotus initiated hostilities. He placed his cavalry in front of his infantry—perhaps to screen an outflanking maneuver on his right wing, like the successful one at Nemea—but the better quality Theban horse routed them, driving them back on their own infantry, causing some

confusion in the ranks. This helped Epaminondas who had advanced obliquely, leading with his Thebans deployed 50 deep on the left flank and his allies on the right trailing. This was unusual as traditionally the best troops were on the right. Epaminondas had also deployed the elite Sacred Band either slightly behind or to the left of his left flank.

Disordered by their own cavalry, the Spartan right flank, personally commanded by Cleombrotus, was halted during their own outflanking attempt and then driven back by the massed Thebans. The Sacred Band then took the Spartans in their unshielded right flank, causing a collapse. Cleombrotus was killed (along with many of his companions), possibly earlier in the battle. The Spartans' Peloponnesian allies on Cleombrotus' left wing and the Theban allies facing them apparently never fully engaged. Peloponnesian League and Boeotian League casualties were light, but around 1,000 Lacedaemonians and 400 Spartiates died, a huge cost to Sparta. Epaminondas made a point of releasing the bodies of Sparta's fallen allies first, emphasizing that most of the dead were Spartans.

Leuctra was terminal for Spartan military power—in the years following a series of campaigns ended Sparta's domination of the Peloponnesian League and, even more serious, over Messenia, and led to a period of Theban hegemony.

Libya

The area of North Africa that lay to the west of Egypt. In early times, for

example, in Homer, the name referred to a distinct and narrow area of land, although later it became synonymous with the entire continent of Africa. Herodotus tells us that there was disagreement as to where the division between the continents of Asia and Libya lay, due in part to the division of the Nile as it entered the Delta region.

The Greeks were aware of the desolate and uninhabited regions of inland Libya (the modern Sahara Desert), although there were many areas of its northern Mediterranean coast that were fertile and populated by Libyans, Carthaginians (or Phoenicians), and Greeks alike. Exploration into the heart of Libya revealed the Niger River, and later exploration under the Ptolemies was made along the Blue Nile.

It was believed that Libya's southern coastline did not extend beyond the equator, although early reports of circumnavigation by Phoenician sailors are difficult to believe. Greek colonization of the Mediterranean coast of Libya was concentrated around Cyrene and the surrounding region known as the Cyrenaica. Egypt remained to the east, and Phoenician and Carthaginian colonies extended to the west, along the coast. Overall, little is known or recorded about the local inhabitants of Libya until Roman times.

Light Troops (*Psiloi*, *Gymnoi*)

The broad term light troops (*psiloi*, sing. *psilos*; *gymnoi*, sing. *gymnos*) essentially denotes any infantry other than the hoplite or Macedonian phalangite. It therefore covers everything from men with nothing more than rocks and daggers (*petroboloi*, lit. “stone throwers”) through peltasts to specialists with the javelin, bow, or sling. Whatever their weapon, light

troops are characterized by a lack of protective armor (compared to the hoplite) and by fighting in no, or a loose, formation. Generally drawn from the poorer sections of society, their protection might consist of a helmet—probably generally a felt or leather *pilos* (see third illustration in the Arms and Armor entry), perhaps a wicker shield (especially for peltasts), and light leather or cloth body protection. The relative lack of protection meant they were more vulnerable than a hoplite, but more maneuverable and faster. The heavier protection and close formation of the hoplite conferred protection but limited maneuverability. Because of this, the hoplite and his phalanx could be vulnerable to light troops (and even more so to light troops operating with cavalry).

Their social class and ability to run from and return to an engagement meant that in most of mainland Greece light troops were looked down upon by the hoplite class. This class saw light troops, particularly those with missiles, as less manly than the hoplite who stood face to face with his enemy in close combat. Athens, for example, had no formally constituted light troops until 424, and this attitude means that light troops are often much less visible in the contemporary record, which was largely written by the hoplite class. As was the case with cavalry, the hoplite dominance of warfare and society inhibited the development and use of light troops in most of Greece south of Thessaly. However, in the northern and more tribal areas such as Aetolia, light troops were the standard troop type and these were often hired as mercenaries to supplement the phalanx. Some areas were known for their specialist troop types—for example, Cretan archers and Rhodian slingers.

As with many other aspects of Greek warfare, the Second Peloponnesian War (431–404) led to an increased use of light troops. During the course of this war it became apparent that hoplites were vulnerable to light troops (particularly those with missile weapons) and it became increasingly standard practice to complement the phalanx with light troops. These were generally deployed on the flanks of the phalanx, to protect it or to threaten the enemy flanks, or in front of it as a skirmish line. In these cases, they often operated with the cavalry.

When used offensively, the light troops would come within missile range, discharge their javelin, spear, sling—or even throw rocks—and then retire to safety when the slower and more cumbersome phalanx tried to catch them. When the phalanx slowed or stopped, the process would begin

again. Some relief could be gained by selecting groups of younger troops (*ekdromoi*) to charge out to keep the enemy light troops away, but this could not be done if the enemy had hoplites nearby who could attack if the integrity of the phalanx was disrupted when the *ekdromoi* left it. The *ekdromoi* who charged out were also vulnerable to attack as they were returning back to their lines.

Spartolus, Pylos, and Lechaeum provide late fifth/early fourth century examples of hoplite phalanxes eventually collapsing under the pressure of continual harassment by light troops. The Athenians seem to have been quicker to grasp the potential of light troops (although Sparta seems to have used Helots as light troops during the Persian Wars), and Demosthenes was particularly adept at their use. Some of the light troops at Pylos (425) were Athenian oarsmen doubling as light infantry and there are other examples of sailors being used this way. In the fourth century, Iphicrates introduced the peltast (originally from Thrace) into Athens and developed peltast equipment to make the arm more effective. From this point on, the use of light troops continued to increase. This was especially so in the kingdoms of the *diadochoi* (Successors to Alexander) who had to recruit from the local non-Greek population, but often excluded them from the phalanx. Most regions in Asia Minor produced light troops or cavalry, not heavy infantry, so these were the troop types available to the Successor armies.

Light troops were cheaper and more mobile than hoplites, able to operate in more rugged terrain and particularly effective in ravaging. However, they did have their limitations. They could not match the hoplite in close combat and were themselves vulnerable to the superior mobility of the cavalry.

Locris, Eastern

The eastern Locrians occupied the coastal strip on the southern side of the Malian and Euboean Gulfs. On the west, they bordered Malians and central Greek Dorians, on the east the Boeotians, and to the south they were separated from their traditional foes, the Phocians, by the range of Mount Cnemis, over which there were several crossing points. They shared ethnic identity and membership of the Delphic Amphictyony with the western Locrians, despite their territory not being contiguous. When ancient authors speak of Locrians, it is not always clear which group they mean. In general, though, the eastern Locrians were less isolated than their western cousins, and thus, for example, may have played a much more prominent part in the Third Sacred War. The eastern Locrians had a more developed federal structure than their western counterparts; the political center was the largest city, Opous.

During the Persian invasion of Greece in 480 the Locrians found themselves on the front line once the Persians reached Thermopylae. The pass at Thermopylae ran from Malis in the west to eastern Locris, though in the event the Persian Army did not use this route but instead marched south and then east through Doris and Phocis. The Locrians contributed to the Greek defense of the pass, but subsequently escaped the Persian depredations suffered by the Phocians. The eastern Locrians were usually allied with the Boeotians, like the Boeotians fought on Sparta's side in the Second Peloponnesian War, and sent a late-arriving contingent to the battle of Delium (424). In the Third Sacred War, they bore the brunt of Phocian aggression, as the Phocians sought to secure routes to northern Greece.

For much of the period from 292 to 167, the eastern Locrians were part of the Aetolian League, but unlike in western Locris this was punctuated by periods under Macedonian or Boeotian control. From 167, they too regained

their independence until falling under Roman rule in 146.

Locris, Western

The western Locrians occupied a mountainous region on the north coast of the Gulf of Corinth, west of Delphi. Their territory bordered Phocis on the east, and Aetolia and Doris on the north. They regarded themselves as ethnically connected with the eastern Locrians, who lived on the other side of Phocis, and together the two groups were considered as one of the *ethne* (tribes) that were members of the Delphic Amphictyony. When ancient authors speak of Locrians, it is sometimes not clear whether they mean one or both groups.

The two major cities of western Locris were Naupactus, on the north coast of the Gulf, close to its narrowest point, and Amphissa, at the north end of the coastal plain below Delphi (behind the modern town of Itea). The hinterland behind the coastal strip along the Gulf is mountainous, and did not boast large cities in antiquity. The exact boundary with Aetolia is not known, and may have changed over time. Politically, the two parts of Locris remained separate; in the Classical Period, western Locris (excluding Amphissa, which was independent) formed a loose tribal state, with its center at the mountain town of Physceis.

Naupactus occupied a strategically important position dominating passage through the Corinthian Gulf, and Athens, which had captured it in

the 460s, used it as a naval base in the Peloponnesian War of 431 to 404 to impede Peloponnesian operations. In the fourth century, the western Locrians were allies of Sparta, but later participated in the Third Sacred War against their traditional enemies, the Phocians. Amphissan encroachment on the sacred land at Delphi was the spark that set off the Fourth Sacred War. From 292 to 167 the area was part of the Aetolian League, but then regained its autonomy until the advent of Roman rule in 146.

Logistics

Logistics is organizing the movement, maintenance, and accommodation of military forces. In the ancient Greek context, this almost entirely involved the supply and transport of food and drink (campaign supplies such as tentage, clothing, and cooking utensils were almost always the responsibility of the individual soldier). Understanding logistics is crucially important for an understanding of Greek warfare—men need adequate food and drink to be able to fight. The acquisition of food, its transport, and its distribution to sailors and soldiers were always therefore central questions facing ancient Greek commanders, and determined the timing and conduct of warfare.

Despite their decisive importance for the success of military campaigns, however, logistics are rarely mentioned in our first surviving descriptions of wars fought by Greeks—Homer's *Iliad* and *Odyssey*. Although these are epic poems, scholars have shown that they, like other epic poems, present a coherent account of the conditions of life in the society in which they were

composed—in the case of the *Iliad* and the *Odyssey*, the Greek world of the late eighth and early seventh centuries. In these poems, Homer describes a world of heroes whose actions were to serve both as a model for rulers of his time and as an entertainment for his audience. There was therefore not much room for everyday and unheroic subjects such as logistics. Nevertheless, enough incidental mentions of ordinary military realities allow us to construct a broad outline of the food supply of armed forces in the Greek world around the turn of the eighth century.

Prior to leaving for an overseas military operation, men might be treated to a feast by the leader of the operation (always their king or another man of high rank) and provided with animals to sacrifice and to consume. This was to build support and morale for the upcoming expedition. Homer mentions the gathering of supplies from the storerooms of kings for men leaving on foreign expeditions of public importance such as Telemachus' voyage to Pylos seeking news of his father, Odysseus, and men leaving on overseas military expeditions were probably supplied in the same way. Men setting out for land wars against neighboring communities, on the other hand, probably just supplied themselves with food from their own resources.

Once Homeric military forces were traveling to or from their overseas military targets, the methods they used to secure their food supply (after their initial provisions ran out) differed depending on whether they were in hostile or friendly territory. If sailing through hostile territory, Homeric warriors simply stole any food they needed (on their way home from Troy Odysseus and his men plundered wine from cities they had sacked and stole sheep from the island of the Cyclopes). In friendly territory, though, military leaders could expect to be received and feasted by the rulers of the communities they stopped at, while the men would receive food such as barley, wine, and cattle from the public stores of the friendly community before they set out again.

When they reached the campaign area, there were two ways in which Homeric military forces acquired supplies: plundering/foraging and trade. While the Greeks were besieging Troy, they sometimes bartered with men from nearby islands who traveled to their camp for this purpose. The Greeks obtained wine in exchange for items they had plundered (such as metals, cattle, and slaves). However, the majority of the Greeks' food came from foraging and (especially) plundering operations. Homer mentions many

raids on nearby areas in which the Greeks plundered cattle and other animals. Although Homer does not mention it in his siege narrative (because it was not dramatic or honorable), we should imagine that the Greeks at Troy also left their camp regularly to collect grain and other foods from surrounding areas. For land wars against neighboring communities men presumably supplied themselves with food taken from the land they were invading.

Greek armies in the late eighth and early seventh centuries therefore did not have a regular commissariat—that is, there was no logistical system organized by Greek communities at this time to support armies or navies operating for any period of time away from their home community. For the rest of the Archaic Period (ending ca. 480), too, Greek armies on campaign lived an essentially hand to mouth existence. The few references we have from this period to the food supply of land armies show them depending on foraging for their food supplies and struggling to stay in the field for long.

We know (relatively speaking) a lot more about the logistics of Greek military forces in the Classical Period. In the late fifth and early fourth centuries, Thucydides and Xenophon give us our first historical narratives of contemporary wars. However, they seldom mention details of logistics in their accounts of military operations since these were familiar to their audiences and because other questions such as grand strategy and diplomacy were more exciting to consider and discuss. We therefore have few exact numbers for logistical matters (we do not know, for example, how many donkeys or private traders ever accompanied any Classical Greek land campaign). Still, with those details of military food supply in Thucydides and Xenophon, and in other literary sources (such as comedies and legal speeches from Athens), we can confidently create a general picture of how Classical Greek armies and navies fed themselves.

Each individual soldier was responsible for providing and preparing his own food (and for other campaign supplies). Soldiers setting out on land campaigns were typically ordered to bring along three days' supplies, which they would gather from their own domestic stores or buy in the market. Three to four pints of barley-meal per day provided the base of soldiers' diets. This barley-meal would be eaten either in the form of *maza*—a kneaded and uncooked barley-cake—or gruel. To add flavor and variety to this basic barley-meal staple, soldiers would also bring along on campaign cheese, onions, olives (but not olive oil usually), garlic, salted fish, and herbs

(such as thyme). All of this would be washed down with water and wine (which the Greeks diluted with water). This diet would have provided somewhere between 3,000 and 3,500 calories per day, more than enough for the average Greek soldier, who would have been 5'7" (160 centimeters) tall and weighed about 150 to 155 pounds (around 168-170 kilograms).

Hoplites or cavalrymen did not carry their own provisions. Their food was usually carried by slave attendants (owned by the soldier, not by the state). These slaves would also have carried hoplites' and cavalrymen's cooking utensils and drinking cups, as well as their bedding, weapons, and armor—although some of these items (together with other collective items such as road-making tools, siege machinery, and tents) would also have been carried on the wagons and (more often) pack-animals (usually donkeys) which also accompanied Classical Greek land armies on their marches. Light-armed soldiers, who came from the less well-off sections of Greek city-states, probably mostly carried their own supplies.

By the time the three days' provisions the soldiers had brought with them from their home cities ran out, they would have found themselves in the territory of another city. If this city was a friendly or neutral one (whose territory the army was traveling through on its way to the war zone), the army's commander would normally send ahead to ask the city to provide a market for the army. The soldiers would then be able (using the pay provided to them by their home city) to buy the supplies they needed for their onward march. The friendly city arranged the organization and operation of the market, which was normally outside the city walls because of the fear of allowing large numbers of armed men inside the gates of the city.

If, however, the army had marched into hostile territory, or if it had already invaded the territory of its enemy, the soldiers supplied themselves mainly through foraging (the collection of food supplies from the area around an army's march route or camp). It was for this reason that Classical Greek land armies usually campaigned in the early summer—this was the time of year when their enemies' grain was ripe but not yet harvested and was therefore available for foraging. For this reason Classical Greek land campaigns were usually relatively brief affairs, lasting only as long as grain and other foods were available to forage. Once this source of supply gave out, armies simply went home (the Peloponnesian army had to return home quickly from Attica in 425 as they had invaded when the grain there was

still green and therefore inedible).

Private traders always accompanied Classical Greek armies on their overland marches, and sometimes in large numbers. These traders, however, never made more than a minor contribution to the supply of land armies. They followed armies mainly for the opportunity of purchasing the army's plunder at low prices, with the goal of making profits from the resale of this plunder in nearby cities. They did sell food, but only high-value, low bulk foods such as cheese and honey to add variety to the soldiers' grain-based diets. The food sold by private traders was therefore always supplementary to the food men acquired from markets provided by cities in friendly territory and from foraging in enemy territory.

Nor did supply trains (a specific section of a military force on campaign dedicated to carrying supplies for that force) usually play any role in the food supply of land campaigns in the Greek world at this time. Even the better organized Spartan armies, which were accompanied by craftsmen and an organized baggage-train with all the tools that an army might need, had no supply train. It was only in special circumstances—when armies unexpectedly had to remain immobile in the field in the presence of nearby enemy forces—that Classical Greek states sent out supply trains to their armies. In 479, for example, supply trains were sent from the Peloponnese to the Greek forces encamped at Plataea. Supply lines (a continuous line of supplies between a military force and its home city or base of operations) were never used to feed Greek soldiers on overland campaigns.

Finally, the donkeys and oxen (pulling the wagons), which provided transport for armies, as well as the horses taking part in military operations, all needed to be fed, too. Here, also, the responsibility lay not with the state but with the animals' owners (although Athens [at least] did provide a daily monetary allowance to cavalymen to pay for most of the costs of the grain their horses ate). Donkeys and mules needed 4 to 6 pounds (1.8 to 2.7 kilograms) of grain (usually barley) a day, horses 5 to 10 pounds (2.26 to 4.5 kilograms), while oxen needed up to 15 pounds (6.8 kilograms) a day. This grain would have been sourced through the same methods men used to feed themselves. All of these animals needed anywhere from 10 to 20 pounds (4.5 to 9 kilograms) of fodder per day, too, though this could be substituted by pasturage on campaign.

Sailors, like soldiers, were also responsible for providing and preparing their own food. For their provisions for the first few days of their

expeditions, they collected from their own stores or bought in markets the same types of food eaten by soldiers: barley-meal, onions, olives, garlic, and salted fish. Sailors also washed down this food with wine (diluted with water) and water. Rowers, however, unlike soldiers, who could generally count on finding water in the countryside they passed through, were not able to source fresh water on board triremes without landing. Rowers setting out on naval expeditions therefore also had to fill water-skins to bring with them on board their triremes before they sailed out on campaign.

Because of the lack of space on board Classical Greek triremes—200 men crammed into a ship 35 meters (nearly 115 feet) long, 6 meters (nearly 20 feet) wide, and 3 meters (nearly 10 feet) high did not leave much room for storage—sailors departing from their home cities could not take with them more than a few days' supplies in addition to their water-skins. Because of this, merchant ships sailed alongside naval expeditions as a sort of supply train, so that the rowers would have food in case bad weather forced them to stop in hostile or uninhabited territory. For the same reason, merchant ships serving as supply trains also accompanied naval expeditions specifically sent out to ravage enemy territory (such as the Athenian raids on the Peloponnese in the first years of the Peloponnesian War of 431–404). Triremes were equipped with utensils such as cooking pots and grills for the men to prepare their food, and water-buckets and containers for mixing wine and water for their drink.

Just as in the case of armies, navies were able to resupply themselves on their way to and from theaters of operations in markets provided by friendly or neutral cities (again using the pay provided them to do so). Once they had reached their theater of operations, navies acquired their food supplies from private traders. Navies in this era often remained stationary for long periods once they had reached their war zone. This was for two main reasons. Firstly, navies were sometimes sent out (especially by Athens in the fifth century) to besiege cities into submission. Secondly, navies that were not besieging cities were not constantly at sea but would remain at their operational bases in between bouts of fighting, especially in winter when poor weather conditions discouraged navies from setting sail. Traders sailed to the camps and operational bases of these navies to sell food to the rowers. Just as on land, there was no centralized state system to prepare and supply food to rowers.

In the middle of the fourth century, Philip II of Macedonia developed an

army more organized and efficient than any previously seen in the Greek world, which enabled him to take control of mainland Greece. Philip did not allow his soldiers to use wheeled transport and limited the number of attendants that infantrymen and cavalrymen could use. He also ordered his men to carry 30 days' supplies on their backs when they marched out at the start of the summer for the campaigning season. But there were limits to Philip's logistical reorganization. Once the supplies his men had brought with them on campaign ran out, Philip's army relied on exactly the same means of supply that the armies of Classical Greek city-states used to feed their armies.

Philip's son, Alexander the Great, as he marched from the Mediterranean to India and then back to Babylonia, supplied his army by markets provided by friendly communities and through foraging in hostile territory or plundering food stores in enemy settlements. But his expedition into Asia also brought him into many areas (such as mountainous and desert regions) where these methods of supply were unavailable. In these cases, as the tens of thousands of animals needed for supply trains would have slowed his march to a crawl, Alexander pre-prepared supply depots along the route of his march instead. These supply depots (sometimes called magazines) were stocked by gifts from communities that were friendly or had surrendered to Alexander or from requisitions (forced appropriations of resources). Sometimes, Alexander had to prepare thousands of water-skins to allow his army to cross particularly dry and barren areas. In addition to these preparations, Alexander sometimes also divided his army into separate contingents to reduce the pressure on the resources of the regions they marched through.

In the Hellenistic Period (from ca. 323 to 30), Greek cities used the same methods to supply their military forces on campaign as those used in the Classical Period. Commanders setting out on campaigns ordered their men to come prepared with provisions. Before marching through friendly territory, commanders would send word ahead to cities to prepare markets for their armies. In hostile territory, soldiers continued to depend on foraging for their supplies. One major change in the Hellenistic Period was that wheat replaced barley-meal as the grain base of all military forces' diets. The 1½ to 2 pints (around 0.7 to 1 liter) of wheat soldiers and sailors consumed every day (usually in the form of bread) contained the same amount of calories as the 3 to 4 pints (1.4 to 1.8 liters) of barley-meal eaten

daily by men in the Classical Period.

Other major changes in military food supply also occurred in the Hellenistic Period. The armies of the men who fought for control over Alexander's vast conquests in the decades after his death still foraged for food in enemy territory. Private traders, too, still supplied food to naval forces when they were engaged in lengthy sieges (as when Demetrius I Poliorcetes besieged Rhodes in 305/4). However, the Successors were also able to exert much greater command over the resources than any Greek city had been able to. They could therefore on occasion requisition from the people they ruled enormous amounts of food to support their armies and navies in the field.

With the formation of permanent kingdoms in the territories conquered by Alexander, Hellenistic royal dynasties (such as the Ptolemies and the Seleucids) were able to build up massive reserves of foods such as wheat, olive oil, and wine through taxation-in-kind and to mobilize these reserves to support their armies and navies. For the first time in Greek history, permanent standing armies could be formed and commissariats set up to feed and maintain them. The men in the garrisons of these armies received two payments: one for pay proper, and another for food. This food payment was often converted into coin to be used to cover basic food expenses. In this case, Hellenistic soldiers could be offered markets by their employers where basic foods were sold to them at fixed prices (that were lower than the market prices for these foods).

It was only, however, with the onset of Roman military campaigning in the eastern Mediterranean that armies and navies of tens of thousands of men were supported in the field by a fully developed logistical apparatus. This logistical superiority—that enabled the Romans to supply more men and for longer than any Greek power—was one of the crucial factors underlying the Roman conquest of the Greek world in the late third and early second centuries.

Long Walls

"Long Walls" were walls connecting a city to its harbor and designed to prevent the city being starved out by a land-based siege. The most famous were the 6-kilometer (4 $\frac{3}{4}$ -mile) long walls connecting Athens with its port, the Piraeus. Built between ca. 462 and 446/5 they first enclosed a large area, with walls to the north of Piraeus and south of Athens' other harbor, Phalerum. A third wall, built south of the Piraeus, later created a narrower corridor less vulnerable to an amphibious landing between Phalerum and Piraeus. The Long Walls prevented a Spartan siege of Athens until the destruction of Athenian naval power toward the end of the Peloponnesian War of 431–404.

Athens' Long Walls were demolished by the victorious Spartans in 404/3 but rebuilt between 395 and 391. The Macedonian garrison in the Piraeus from 322 rendered them obsolescent, though the Long Walls are mentioned in an inscription of 307/6 dealing with wall maintenance. Other examples of "Long Walls" are Megara (built with Athenian help in 459 and demolished by Athens in 424), Corinth (to its northern port Lechaëum on the Corinthian Gulf), Argos, Amphipolis, and Patrae.

Lycurgus (ca. 390–324)

Lycurgus, a fourth-century Athenian statesman and orator, was born into the aristocratic family of the Eteoboutadae; his grandfather, also named Lycurgus, was killed by the Thirty Tyrants. After studying at the schools of both Plato and Isocrates, Lycurgus emerged as a significant public figure rather late in life. From 338 to 326 he played a predominant role in managing his city’s finances, probably as Treasurer of the Military Fund. He probably died in 324.

Lycurgus is said to have raised the annual revenue of the Athenian state from some 600 to some 1,200 talents. This enabled him to fund an impressive number of public works, which included a portico at Delphi, the refurbishment (the stone seating of which survives today) of the Theatre of Dionysus, and the publication of an official copy of the works of the three great tragedians.

Lycurgus was instrumental in strengthening Athens’ defenses in the wake of its disastrous defeat at Chaeronea (338). His military significance lies mainly in his ambitious rebuilding of the naval ship sheds in the Piraeus, the completion of a large arsenal nearby, and various improvements to the city’s walls. But his efforts were not merely architectural. He also vigorously prosecuted citizens who, in his perception, had either failed the Athenian cause at Chaeronea or abandoned it afterward. These included Lysicles, a general at the battle, and Leocrates, whose suspicious absence from the city from 338 to 332 is the subject of Lycurgus’ only surviving legal speech.

Lycurgus (Spartan) (Unknown Date)

Lycurgus is the traditional founder of the Spartan system of government. The details of this mythical, or semimythical, figure are quite obscure. Plutarch, for example, opens his *Life of Lycurgus* with the following admission:

Nothing can be stated about Lycurgus the *nomothetes* (lawgiver) which is not disputed. Different accounts exist of his birth, travels, and death, and especially of his laws and constitutional reforms. There is least agreement among historians about when he lived. (Plutarch, *Lycurgus* 1)

Despite this, Plutarch manages to write a 23-chapter account of Lycurgus, but it must be largely fictitious. Like his later, and historical, Athenian counterparts, Solon and Cleisthenes, Lycurgus is supposed to have implemented his reforms in part to end internal strife. Also like Solon, there is a tendency with Lycurgus to ascribe any good feature of the system to one of his "reforms." The hallmark of his reform was *eunomia* or "good order" and this was regarded as the main feature of Spartan government and society for much of antiquity. The constitution was widely regarded as a good, or even the best, model of a "balanced" constitution, in which no element was unduly predominant. The Lycurgan system was underpinned by the principle that Spartiates were *homoioi* or "equals." Each Spartiate underwent the state training system or *agoge* and as an adult had a plot of land, worked for him by Helots, to generate his contribution to the *syssition*, the common mess, and feed his family.

All adult Spartiates over 30 were members of the *apella* or assembly. This met once a month, summoned by the ephors, and was regarded as the democratic element of the constitution. The *apella* voted on major issues, especially war, peace, and disputed royal successions, and elected the ephors, members of the *gerousia* (the council of elders), and other magistrates. However, there seems to have been no provision for debate and voting was by the primitive system of acclamation (whichever side made the loudest noise was adjudged the winner) or division (where the “yes” voters moved to one side and the “no” voters to the other). In addition, the decisions of the *apella* seem to have been subject to veto by the *gerousia*.

The *gerousia*, or council of elders, was regarded in antiquity as the aristocratic element. It comprised the 2 kings and 28 nobles over the age of 60. The latter were elected by the *apella*, but held office for life. The *gerousia* prepared the agenda for the *apella*, was the supreme criminal court (except for the *Perioikoi*), and was the advisory council to the kings. The *gerousia* was seen as a check on the kings and on the *apella*—as noted, the *gerousia* could veto the *apella*’s decision by dismissing it.

The two Spartan kings were hereditary monarchs from the Agiad and Eurypontid families. They had religious, judicial and military functions, which represent in some respects vestiges of earlier royal power. Under the Lycurgan system, the kings held some priesthoods and conducted sacrifices to Apollo, and the prebattle sacrifices. They judged issues concerning adoptions, heiresses, and public roads. However, their main role was military—they were the supreme commanders (although by 500 this was curtailed by their being accompanied on campaign by two ephors as advisers) with the right of execution in the field. Originally they could declare war, but this function was later transferred to the *apella*.

The final element of the Lycurgan system was the ephorate, which seems to have been later than the other elements. Each year the *apella* elected five ephors. On taking office they swore to maintain the kings’ powers undiminished (if the kings kept their oaths to preserve the constitution). The ephors constituted the supreme civil court and the supreme criminal court for the *Perioikoi*. They ordered the levying of the army and two of them also accompanied the king as advisers. They also chaired the *apella* and attended meetings of the *gerousia*. In antiquity, the ephors were sometimes seen as an oligarchic element, although as they were elected and only held office for one year they should be regarded more as a

democratic element.

Clearly there are strong survivals from Archaic Greek society in the Lycurgan system—the monarchy and *gerousia*, but also the *apella*, which was essentially the army acting as an assembly to vote on key matters involving it. However, elements were added over the years. Unfortunately the available evidence is not good enough to decide when each element was introduced or whether it was gradual, the work of Lycurgus, or another single reformer, or a mix of the two.

The earliest mention of Lycurgus is in Herodotus, who dates him to around 900, which is surely too early. Other ancient writers tend to place him ca. 775, although there are also other suggestions. Whether Lycurgus actually existed—and it is quite possible that the core of the system attributed to him was developed by one man—is now impossible to recover. Nevertheless, and noting that it was supposedly based on the Cretan system, the Lycurgan constitution of Sparta provides perhaps the best example of a balanced or mixed constitution prized by the Greeks as the best means of avoiding *stasis* or internal conflict. In the Lycurgan system, each part wielded important powers, but each also had a check on it from some other part of the system. Although the strength of personality of the individuals (especially the kings and ephors) could mean that one element gained a temporary ascendancy that was not intended, in general the system worked.

Herodotus (1.66) notes that Lycurgus' reforms were so successful in achieving stability that in combination with the fertility of Laconia the population increased to the point that they decided to expand into Arcadia and surrounding areas. Although the date is traditionally ca. 570 (much later than Lycurgus' possible dates), according to Herodotus (1.66) the Spartans' first effort in this endeavor ended in disaster at the "Battle of the Fetters" in Tegea. Nonetheless, Lycurgus' model "good order" somewhat ironically contributed to conflict in the Peloponnese, and led to several hundred years of Spartan military domination of the region. The system did begin to break down after Sparta's defeat at Leuctra (371) and the loss of Messenia shortly afterward, but real *stasis* is not seen in the city until the third and second centuries.

Lydia

A kingdom in western Anatolia (modern Turkey) that grew to prominence during the seventh and sixth centuries, frequently clashing with the Greek city-states of Ionia. The most famous of the historically-attested kings of Lydia was Croesus (ca. 595–547), who was the last king of the Lydians, as the kingdom was defeated and absorbed into the Persian (Achaemenid) Empire.

There is little archaeological or historical evidence for the Lydians prior to the eighth century. Herodotus (1.7) has preserved a spurious list of kings and dynasties from early Lydian history, but it is not until the reign of Gyges (ca. 680–644) that the name of a Lydian king is corroborated in other historical material. Beset by invasion, Gyges’ petition for assistance from Assurbanipal, the king of Assyria, is preserved in the archives of Assyria and dated to ca. 664. Later, around 660, Gyges is said to have sent mercenaries to Egypt to assist the Pharaoh Psammetichus I. Lydia clearly had well-developed cultural ties and trade relationships with the other great kingdoms of the Near East. Indeed, trade routes between the Greek cities of the west and the powers of the Near East, fostered by cultural bonds, were as integral to the famed wealth of the Lydian kings as were the electrum refineries and coin mints of the capital city Sardis.

Under Gyges, Lydia began encroaching on the Ionian Greek cities of the Aegean coast, attacking both Smyrna and Miletus. Gyges’ successor Ardys

(ca. 644–late seventh century) even captured Priene, although the Lydians never managed to establish a permanent foothold on the Aegean coast. Despite frequent conflict the Lydian royal family maintained close ties with the Greek world, including intermarriage with prominent Greek families, such as that of Melas, the tyrant of Ephesus. The Lydians also gave offerings to and worshipped at Greek temples and sanctuaries, such as at Delphi, Assesus (a sanctuary in the territory of Miletus), and the great temple to Artemis at Ephesus. But ultimately Croesus, according to Herodotus fatally misunderstanding a message from the oracle at Delphi, invaded the territory of the Persian (Achaemenid) Empire. When he was defeated by Cyrus, both the Lydian kingdom and the Lydian capital of Sardis swiftly fell to the Persians in c. 547.

Lysander (d. 395)

Lysander, a Spartan admiral, played a major role in Athens' final defeat in the Second Peloponnesian War. He did this by reinventing Spartan foreign policy late in the war: making friends with the Persian prince Cyrus, which reversed earlier Spartan reluctance to deal with Persians, and accepting Persian subsidies against Athens, a novel practice in Sparta. Through these means and his own planning, Lysander administered a more energetic, efficient, "modern" overseas Spartan imperialism in the form of a brief Spartan empire from 407 onward. Each of this empire's constituent cities was governed by Spartan governors and by decarchies, oligarchic boards of 10 men personally loyal to Lysander (with 30 men in huge Athens). Later

sources state that Lysander had been brought up in poverty and was not a Spartiate full citizen but a *mothax*, which seems to indicate an individual who had a Helot mother and Spartiate father. Given the Spartiate population decline in the Classical Period, and the usage of Helots, *Perioikoi*, and *Nothoi* in the Spartan forces, it is unsurprising that non-Spartiates could attain power in the Spartan state. Allegations that Lysander sought to remake the Spartan kingship into a meritocracy also fit into this picture.

Such novelties were not welcome in Sparta, creating friction with individuals like Callicratidas, admiral after Lysander in 406, who despised Spartan-Persian friendship. In 405, Lysander defeated the Athenian fleet at the battle of Aegospotami, destroying Athens' grain supply, and then sailed to Athens in 404, where he besieged it into surrendering and becoming a subordinate ally to Sparta. Lysander thus ended the Peloponnesian War, and his efficacy in concluding this bloody generation-long conflict occasioned unprecedented divine honors in Greece, including altars, sacrifices, a religious festival to Hera on Samos renamed the "Lysandreia," and a statue-group at Delphi showing Poseidon crowning Lysander, with the Dioscuri, Zeus, Apollo, and Artemis alongside. After the War, Lysander acted as kingmaker, obtaining a kingship for his *eromenos* Agesilaus II even though the latter's handicapped status would normally have obstructed kingship in eugenics-loving Sparta. Lysander, hoping to restore or maintain his decarchies in Asia Minor, next served for a period in Asia in a Spartan expedition against the Persian Empire in 396, his many petitioners provoking jealous resentment from Agesilaus, and died during the Corinthian War, at the battle of Haliartus in Boeotia in 395.

Lysander's interest as a historical figure extends beyond his ending the Peloponnesian War. He attempted to be a "modernizer" to aristocratic Sparta, utilizing marginal classes in Spartan society to alter Sparta's role in a changing Aegean, seeing Persian and Spartan corule of the Aegean as a possibility, creating a coinage fitting both within the Persian and many Greek standards in Asia Minor and the islands, appointing military governors regardless of birth or wealth, and attempting to widen the Spartan kingship.

Lysimacheia

Lysimacheia was founded in 309 on the narrowest part of the Thracian Chersonese as the royal capital by Lysimachus, one of the Successors (*diadochoi*) of Alexander, who ruled Thrace, and much else, from ca. 322–281. Its exact location is uncertain. If it was on the Hellespont side of the Isthmus, the city was intended to command the sea-route through the straits. However, there is no sign that this was the case, and it is more likely that Lysimacheia was on the other of the isthmus, very close to or on the site of Cardia, or, even more likely, in the center of the peninsula near the modern village of Bolayir.

Lysimacheia was important as a bulwark against Thracian and later Gallic raids. After Lysimachus' death in 281, it was briefly occupied by Ptolemy Ceraunus before passing to the Ptolemies. In 277, it was the scene of a notable victory by Antigonus II Gonatas over a Gallic horde. At one point Lysimacheia was an external member of the Aetolian League. It was taken by Philip V in 202 during his campaign in this region, and soon afterward devastated by Gauls (ca. 199).

Antiochus III reestablished the city in 196 when he first brought his army across the Hellespont. After his defeat at Thermopylae (191), he rebuilt its walls and made it his main supply base. However, he let it fall intact to the Romans when he abandoned the defense of the Chersonese (190). Lysimacheia decayed into insignificance after this time.

Lysimacheia, Battle of (277)

In 277, Antigonus II Gonatas sailed with his forces to the Thracian Chersonese, where Macedonian power had collapsed. Anticipating an attack by an invading Celtic tribe with 5,000 infantry and 3,000 cavalry, Gonatas abandoned his camp near Lysimacheia, moved a few troops and the non-combatants to his naval encampment and concealed his main force in a forest. The Celts made a night attack on the camp and, encouraged by finding it deserted, made straight for the fleet, expecting easy plunder. They were there taken in the rear by Gonatas' concealed troops and wiped out.

Lysimachus (ca. 355–281)

Lysimachus was an able officer in Alexander the Great's army who rose to the prestigious rank of *somatophylax* (bodyguard). In the carve-up of the empire after Alexander's death he received the underdeveloped region of Thrace. Hard fighting against the Thracian tribes was necessary to assert his control over the hinterland, on which Lysimachus set out to impose the same tight control as over the Greek cities on the coast.

Lysimachus prudently stayed out of the wars among Alexander's Successors but did follow others in taking the title of king in 306/5, thus formally opposing any attempt at restoring Alexander's empire. The main

threat of this kind came from Antigonus I Monophthalmus in the western part of Alexander's Asiatic empire. In 302, in collaboration with Seleucus I in Babylon and the other kings, Lysimachus invaded Asia Minor and in a brilliant defensive campaign pinned down Antigonus until he and Seleucus were able to defeat and kill Antigonus at Ipsus (301). As his reward, Lysimachus took over the rich territory of Asia Minor. Now with wider ambitions, he extended his kingdom northward across the Danube until a defeat by the Getae forced him to make the Danube his frontier (297). He joined with Pyrrhus of Epirus in stopping the attempt by Antigonus' son Demetrius I Poliorcetes to take the kingdom of Macedonia. The two divided the kingdom but two years later Lysimachus took over the whole (287–285).

By this point Lysimachus was at the height of his power, ruling a territory extending from the Adriatic to the Black Sea. His personal life had so far been sedate but infatuation with a new wife Arsinoë (daughter of Ptolemy I) led him to believe her allegations that his son and heir, the highly popular Agathocles, was plotting against him. His murder of Agathocles alienated the nobility who called in Seleucus. In the battle of Corupedium in Asia Minor, Seleucus defeated and killed Lysimachus (281).

Tough in combat and a highly capable administrator, Lysimachus was dour and uncharismatic. He did not help his reputation by his rigor in collecting taxes and by his tight-fistedness in spending his money, at a time when kings were expected to be liberal. His city foundations included his capital Lysimacheia in the Thracian Chersonese, Alexandria Troas on the Asiatic coast south of the Hellespont, and Arsinoeia, a refoundation of Ephesus. These were utilitarian rather than showy. Lysimachus' abundant coinage, which was of a high standard of purity and artistic production, perpetuated the same types as Alexander the Great had used. Alone of the Successors, Lysimachus did not put his own portrait on his coins.

M

Maccabean Revolt (167–160)

The Maccabean Revolt was a guerrilla war conducted by traditional Jews against the Seleucids and hellenizing Jews to restore Jewish religious autonomy. The revolt proper lasted from 167 to 160, but fighting to gain further autonomy continued down to 140, when Judaea achieved independence.

There are two theories of the nature of the revolt. One is that it began as a civil war between traditionalist and hellenizing Jews (those willing to worship Greek gods), which led to wider conflict when Antiochus IV, the Seleucid monarch, intervened on the side of the hellenizers. The more traditional view is that the revolt resulted from Antiochus IV forcing the Jews to worship Greek gods. Antiochus IV's policy was a reversal of Antiochus III's policy of Jewish religious autonomy. Enraged by a Jewish revolt in 168, Antiochus IV brutally sacked Jerusalem in 167 and attempted to suppress the Jewish religion.

In accordance with Antiochus' policies, an official, Apelles, directed Mattathias the Hasmonean, a prominent citizen of Modin, to sacrifice to the Greek gods. He refused and, with his sons, killed another Jew who stepped forward to sacrifice—and then Apelles. Fleeing into the desert with their supporters they began a guerrilla war against the Seleucids and the hellenizing Jews. Noting that previous rebels had been butchered when they refused to bear arms on the Sabbath, in a major departure from Jewish tradition, Mattathias and his sons decided to fight every day.

Mattathias died a year later, but was succeeded by his son, Judas Maccabaeus. Under Judas' command, the Maccabees won several important victories. The Seleucid general Apollonius was defeated and killed, then a

large Seleucid force defeated at Beth-Horon and its commander Seron killed.

Distracted by a major campaign in Persia, apparently over nonpayment of taxes, Antiochus delegated the Jewish campaign to a trusted commander, Lysias. However, the Jewish forces defeated a large Seleucid force at Emmaus before taking Jerusalem, and in December 164 purified the temple. This purification is the origin of the Chanukah celebration, still conducted today.

After Antiochus IV's death in 164/3, Lysias, now regent for Antiochus V Eupator, led a large army to recapture Jerusalem. Although meeting with some success, Lysias was forced to make terms with the Jews to protect Antiochus Eupator's shaky reign. He did so in 162 by restoring Jewish religious autonomy. Although the fighting continued for some years, its nature had changed—it was now about Jewish political autonomy not religious autonomy.

In 161, Judas Maccabaeus won a major victory against the hellenizers and the troops of Demetrius I Soter (who had deposed Antiochus V) and sought an alliance with Rome. However, he was killed the following year. Judas' brother Jonathan continued to fight until 152, when extracting concessions during the war between Demetrius I and Alexander I Balas he was made high priest and given military command in Judaea. Jonathan continued to capitalize on the ongoing dynastic conflict after Demetrius I's defeat and death, dealing with all sides—Alexander I Balas, Demetrius II Nicator, Diodotus Tryphon, and Antiochus VI Epiphanes. When Jonathan was killed by Diodotus Tryphon, his brother Simon, the last of Mattathias' sons, became leader. Faced by multiple threats from several opponents, in 140 Demetrius II gave Judaea independence.

Macedon, Macedonia

Macedon, or Macedonia, was loosely defined geographically, primarily because it consisted of a number of tribes and baronies, each asserting varying degrees of sovereignty. The monarchy was therefore never absolute; the king, despite the efforts of Philip II and his son Alexander III, was always *primus inter pares* (first amongst equals).

The Argead royal family, according to myth, descended from Heracles through Perdiccas, the son of Temenus, king of Argos. Perdiccas left Argos and founded a kingdom in the area of Vergina, ancient Aegae, just south of the Haliacmon River and north of Mount Olympus. Perdiccas' son and successor, Argaeus, gave his name to the Argead family. This story, however, only ever appears in the context of Alexander I (ca. 495–452), who used it to legitimate his participation in the Olympic Games.

The early history of Macedon is therefore unverifiable, but we can accept that it originated near Vergina, and that through the sixth century it expanded to encompass the lowland marshes between the Axios and Haliacmon rivers, from the shores of the Thermaic Gulf north to the mountains bordering on the territories of the Paeonians and Illyrians. This geographical diversity produced cereal crops and small animal husbandry, but the most valuable resources were minerals and timber. The spears and ships used in vast quantities by the warring Greek city-states were mostly provided through Macedonian timber.

The sixth king, Amyntas I (513–497), may have expanded Macedon east of the Axios River and into the Chersonese. However, under him Macedon also became tributary to the Persian Empire and the expanded territory may well have been a gift from Darius I.

Alexander I (ca. 495–452), the son of Amyntas, despite being subject to the Persian king, assisted the Greeks during the Persian Wars. After the Persian withdrawal from Europe he expanded Macedonian territory as far east as Mount Dysoron.

Through the fifth century Macedon remained on the periphery of the Greek world. During the Second Peloponnesian War, the role of Perdiccas II (454–413) mostly involved rival claimants to the throne and a Thracian invasion. However, his reign provides the best picture of the Macedonian monarchy. An Athenian treaty with Macedon in the 440s records Perdiccas as head of state, but also several other Argeads, each of whom is called

“king.” In addition, Thucydides (2.99) says that “there are in Macedonia the Lyncestian and the Elimeioatae and other highland nations who each have their own sovereignty despite being subject to Perdiccas.”

Archelaus (413–399) improved Macedon’s defenses and administration, including relocating the capital to Pella, but his murder instituted several years of short reigns and turbulent successions. The reign of Amyntas III (393–370) was little more than a struggle for survival with internal disputes complicated by an Illyrian invasion and the loss of much territory—even the capital for a short time. Amyntas’ three sons succeeded in order: Alexander II (370–369/8), Perdiccas III (365–359), and Philip II (359–336).

Philip II, against all odds, steered Macedon from virtual annihilation to become the leading power in the Greek world. He is most celebrated for his military reforms, creating a standing professional army with revolutionary new weapons and training. Philip also added a newly equipped cavalry that could be used as a front-line assault weapon, and continued to employ hoplite infantry, slingers, javelins, and archers. Arguably he was the first commander to employ what are now called “combined arms tactics.” Most importantly, Philip reconstituted the relationship between the baronage and the monarchy, creating the “Companion Class” that fostered loyalty to the crown never before seen in Macedon.

As a result, by 357 Philip was quickly able to conquer the Illyrians, Paeonians, and Thracians. The same year Philip became involved in Thessaly and, in 355, with the Social War; in 346 he ended the Third Sacred War and became influential at Delphi. Fear of Philip’s growth aroused the city-states and in 338 he met and defeated a combined Greek army at Chaeronea. The battle established Philip as hegemon, or master, of the Greek world and he established the League of Corinth, announcing his plans for the invasion of Persia. However, Philip was assassinated in 336 and his 20 year old son, Alexander, succeeded as king.

Alexander III (the Great) moved quickly, suppressing rebellions to the north and then that of Thebes, which was destroyed in 335. In 334, he invaded Asia and by 330 had conquered the Persian Empire. The war to capture the Upper Satrapies—modern Iran, Afghanistan, and Pakistan—took another five very difficult years and considerable Macedonian manpower.

When Alexander died of illness in 323, his generals contended for the empire. Antipater was regent in Macedon and immediately faced an Athenian-led coalition of Greek states. Antipater was defeated at

Thermopylae and withdrew to Lamia in Thessaly. Only the arrival of Macedonian forces from Asia enabled him to defeat the Greek coalition, but his victory in the Lamian War (323–322) helped secure his position. Antipater died in 319, and Polyperchon became regent, initiating a long and bitter contest for control. Cassander, the son of Antipater, was able to rally the Greek states against Polyperchon and by 315 ruled Macedon.

Despite attempts by Antigonus I Monophthalmus to take control of Greece and Macedon, Cassander managed to eliminate Alexander's bloodline and take the royal title in 305. The direct threat from Antigonus ended with his death at Ipsus (301) and the postbattle settlement confirmed Cassander as ruler of Macedon and Greece. Cassander was succeeded by three of his sons, none of whom ruled long or well, and Demetrius I Poliorcetes, the son of Antigonus, gained the throne in 294. But in 288, Demetrius faced a multipronged attack that ended with Pyrrhus of Epirus on the throne. Pyrrhus' tenure was brief. In 287, he was ousted by his former ally, Lysimachus, who ruled Macedon until 281.

After a period of rapid successions and even anarchy, Antigonus II Gonatas, the son of Demetrius I Poliorcetes, became king in 277/6. His reign was long, ending with his death in 240/39, but plagued by constant threats from Epirus. He was succeeded by his son, Demetrius II (239–229) and he by Antigonus III Doson (229–222).

The history of Macedonia entered its final phase with the accession of Philip V (222–179), the son of Demetrius II. Philip took the side of Hannibal in the Second Punic War, which brought the enmity of Rome. The First (215–205) and Second (200–196) Macedonian Wars reduced the power of Macedon considerably and attempts to restore it resulted in the defeat of Perseus, the son of Philip, by the Romans at the battle of Pydna (168). With that, Macedon ceased to exist as an independent nation.

Macedonian War, First (215–205)

Causes

The First Macedonian War was fought between King Philip V of Macedon and Rome after Philip signed a treaty of mutual cooperation against Rome with Hannibal, who had recently defeated Rome in the battle of Cannae in 216.

Course

The Roman strategy was mostly defensive. They struck a treaty of alliance with Macedon's inveterate enemy the Aetolian League in 211, intending that the latter would fight as Rome's proxy in Greece. Philip's strategy was to push westward against the Illyrian peoples, especially those linked to Rome through informal ties of friendship, with a view to perhaps invading Italy itself to link up with Hannibal. The king's plans were frustrated because he was unable to match Roman naval power. The Romans controlled the seas with a new Roman ally (from 210), Attalus I of Pergamum. The war ground to a stalemate. Philip (and his allies, the Achaean League) became bogged down in land operations against the Aetolians and their allies, thus recreating the conditions of the earlier Social War (220–217).

Consequences

In the absence of significant Roman infantry deployments in Greece, the Aetolian League made peace with Philip in 206, compelling the Romans to make an unsatisfactory peace (the Peace of Phoenice) with the king in 205.

Macedonian War, Second (200–196)

Causes

The Second Macedonian War was fought between Rome and King Philip V of Macedon. Various causes for the war have been cited: Rome's desire for revenge, greed for plunder, fear of Philip's imperial ambitions, and the need to demonstrate Roman *fides*, "good faith," to their allies, and friends in the East (Attalus of Pergamum, Rhodes, Athens, and the Aetolian League), who sought Roman protection against Philip's attacks.

In 200, only a year after the Roman victory over Carthage in the Second Punic War, the Senate asked the assembly to authorize a war on Philip, but the people, exhausted by the recent war with Carthage, refused. They reconsidered after a timely speech by the consul Publius Sulpicius Galba. Envoys were dispatched to the east armed with a conditional declaration of war on Philip. One delegation appeared in Athens, currently under attack by Philip's general Nicanor. Another embassy, headed by Marcus Aemilius Lepidus, met with Philip while he was besieging Abydus on the Hellespont. Aemilius demanded that Philip not wage war on any Greek state and submit his differences with Rhodes and Attalus to arbitration. Philip refused these conditions and a state of war came into being.

Course

The Senate dispatched its fleet to Greece under Galba's command in September 200. Philip was now at Demetrias, from where he marched to Athens and laid waste Athenian territory, while a detachment of Roman ships was dispatched to protect the Attic coastline. During the following

winter, Galba tried to bring the Aetolian League on side in time for his spring offensive. His strategy was to invade Macedon from the west while the Dardanians and Illyrians did so from the northwest; the Aetolians were needed to invade from the south via Thessaly, while the Roman fleet would patrol the eastern coastline of Greece. In early spring, 199, Galba entered Macedon and defeated Philip's cavalry in a few skirmishes. He then defeated Philip's phalanx and seized the modern Kirli-Derbend pass in northern Greece, before returning to the Illyrian coast to winter at Apollonia. In this same year, Philip scored some successes in Thessaly against the Aetolians and their ally, Amynder of Athamania, while his general Athenagoras defeated the Dardanians on Macedon's northern flank.

In early spring, 198, Philip seized one end of the Aous pass in Epirus, which he reckoned, correctly, the Romans would use to reenter central Greece from the Illyrian coast. The Romans entered the Aous valley by early May, and set up camp opposite Philip. While the Roman commander, Galba's replacement Publius Villius Tappulus (consul 199), was debating whether to try to force the pass, his replacement, Titus Quinctius Flamininus (consul 198) arrived. After a 40-day lull and a failed mediation attempt by Epirus, some skirmishing broke out between the two camps. A local shepherd showed Flamininus a route around Mount Meropus, which stood between the two armies. Flamininus sent a detachment of 4,000 men behind Meropus and surprised Philip by suddenly appearing in his rear. The detachment sent up smoke signals, indicating Flamininus should begin his attack. Philip, caught between two Roman armies and unable to deploy his phalanx in the narrow pass, fled south into Thessaly, where he laid waste the territory of his own subjects (probably in an attempt to deprive the Romans of supplies). Flamininus marched through the Aous gorge into Thessaly, and Philip withdrew into the Vale of Tempe, refusing to give battle. The king's plight was made worse by the news that the Achaean League had defected to the Roman side, and that Flamininus had taken Elatea, effectively shutting the king out of Phocis and eastern Locris.

While Flamininus was trying to force his way into Opus (November 198), the king requested peace talks. The Romans demanded that the king evacuate Greece, return all the gains he had made in Illyria during the First Macedonian War, and return to Ptolemy all the Asia Minor towns he had conquered between 204 and 200. Philip asked leave to send an embassy to Rome. Flamininus, playing for time while awaiting word about whether his

command would be extended for another year, readily agreed. In Rome, Flamininus' agents secured the extension of his command and scuttled talks with Philip's envoys. They departed Rome having accomplished nothing.

The campaign of 197 culminated in the battle of Cynoscephalae. A detachment of Macedonians, dispatched to seize the heights of Cynoscephalae, blundered in a thick mist into a Roman detachment on a reconnaissance mission. The early skirmishing soon evolved into a battle. The two sides were evenly matched until an unnamed Roman military tribune halted the pursuit of Philip's defeated left wing, wheeled about, and attacked Philip's victorious right wing in the rear. The Macedonians threw down their shields and retreated, while Philip withdrew toward Tempe. The king now sued for peace.

Consequences

The terms of peace were as follows: Philip was to surrender his fleet, set all his Greek possessions free, and pay an indemnity of 1,000 talents. He was allowed to retain his kingdom but had to surrender control of Thessaly. At the Isthmian Games in July 196, Flamininus declared "the Freedom of the Greeks." All Greeks would be free, independent, and subject to their own laws henceforward. The Romans would leave no garrisons behind nor demand any tribute.

Macedonian War, Third (171–168)

Causes

The Third Macedonian War was fought between Rome and King Perseus of Macedon. The causes of the war are obscure. Polybius' ancient analysis is far from satisfactory: he points to Perseus' inheritance of his father Philip V's anger and resentment toward Rome for various diplomatic humiliations at Rome's hands in the 190s and 180s. Philip, however, collaborated with Rome, always complied with Roman instructions and demands, and there are no overt signs of hostility toward Rome on his or Perseus' parts. Indeed, the first act of Perseus' reign in 179 was to renew Macedon's friendship with Rome, which the Roman Senate readily granted, in addition to acknowledging Perseus' legitimacy as Macedon's new king. Roman greed for glory and plunder, Roman fear of Perseus' growing power and influence in Greece, and Roman disdain for Perseus' pretensions to equality with Rome have been cited as motives for Rome's declaration of war. The desire to demonstrate their *fides* (good faith) toward King Eumenes II of Pergamum, Macedon's traditional rival, may also have influenced Rome's decision to go to war. In a closed-door meeting early in 172, Eumenes detailed for the senators a long list of Perseus' crimes and misdemeanors. Whether any of the allegations were true cannot be known, but what Eumenes said certainly stirred the senate to action.

Course

Roman envoys were sent around Greece in 172 to drum up Greek support. War was declared in spring 171, and Roman armies crossed the Adriatic several months later. An initial encounter in Thessaly resulted in a shock loss for Rome. Perseus tried several times to negotiate, but the Romans unacceptably insisted on the king's absolute surrender. The war continued in desultory fashion for several years as Roman troop morale sank, troop recruitment failed, and Rome's reputation among the Greeks plummeted. Meanwhile, Perseus attracted more allies, including the Illyrian king

Genthius and most of Epirus. The tide turned in Rome's favor in 169, when the consul Quintus Marcius Philippus restored Rome's reputation and invaded Macedon itself. In June 168, Philippus' replacement, Lucius Aemilius Paullus, won a decisive victory at the battle of Pydna. Perseus was captured and sent to Rome to grace Paullus' triumph, and later died in captivity. Genthius of Illyria was defeated later that same year.

Consequences

The Macedonian monarchy was abolished and replaced by four self-governing republics. The mines were closed and the republics were forbidden to have any dealings with each other. The Epirotes were punished by having 70 of their towns turned over to the Roman soldiers to plunder at will, and 150,000 people were sold into slavery.

Macedonian War, Fourth (150–148)

Causes

The Fourth Macedonian War was fought between Rome and Andriscus of Adramyttium, who claimed to be Philip, the son of Perseus, the last king of Macedon. Philip had in fact died in captivity at Alba Fucens in Italy in the late 160s.

In 153, Andriscus, posing as Philip, tried but failed to stir up a nativist

revolt in Macedon. In 151, he sought help from the Seleucid king Demetrius I Soter. The latter sent Andriscus under guard to Rome, but the Senate released him. Andriscus then went to Miletus, where he was imprisoned, but then released. He next went to Pergamum, and made contact with Callippa, a former concubine of Perseus, who fitted him out in royal attire and a diadem, and gave him money and slaves. He journeyed to Thrace, where various Thracian chiefs, including Teres, who was married to a granddaughter of Perseus, gave Andriscus troops.

Course

With the troops from Teres, Andriscus entered Macedon in 150 and won two battles against the Macedonians. He arrived at Pella and proclaimed himself King Philip VI. He then conquered most of Thessaly. The Senate sent Publius Scipio Nasica to try to negotiate a peaceful solution, but talks failed, and Nasica used Achaean troops to defend Thessaly. A Roman army led by the praetor Publius Iuventius Thalna was sent against Andriscus in 149, but was soundly defeated, and Thalna was killed. Another Roman army, under the command of the praetor Quintus Caecilius Metellus, arrived in 148. At some point, Andriscus' general Telestes defected with the Macedonian cavalry. Another troop of Macedonian cavalry won an initial skirmish against the Romans. Andriscus then divided his army in two and sent one half to ravage Thessaly while he remained with the other half near Pydna to confront Metellus. Metellus defeated Andriscus and won over the rest of his army. Andriscus fled to Thrace, but was handed over to Metellus by Byzes, a Thracian prince.

Consequences

Metellus celebrated a triumph, in which Andriscus was displayed, and adopted the honorific title Macedonicus.

Magna Graecia

A term (lit. “Great Greece”) properly applied to the area of Greek settlement in southern Italy, but also sometimes used to denote the Greek settlements in Italy and Sicily. Magna Graecia, which became wealthy from the fertility of its lands and its prime position for trade, had an important influence on the local Italian peoples. However, it gradually fell under Roman control from around 350 to 200. Its cities included: Caulonia, Croton, Cumae, Elia, Epizephyrian Locri, Metapontum, Neapolis, Paestum, Rhegium, Sybaris, Tarentum, and Thurii.

Magnesia

Magnesia was a region along the coast east of Thessaly, occupying the coastal lowlands on either side of the long ridge of Mount Pelion and Mount Ossa to the north. Like the Achaeans of Phthiotis and the Perrhaebians, the Magnesians were in the Classical Period dependents (*perioikoi*) of the Thessalians; writing two centuries later, Aristotle says that the Thessalians achieved this domination over their *perioikoi* through war. The Magnesians were a member *ethnos* (tribe) of the Delphic Amphictyony, and were colonizers, giving their name to Magnesia on the Maeander in Asia Minor.

With the Thessalians, the Magnesians medized in 480, and the Persian fleet that fought at Artemisium, after suffering off the dangerous and harborless east coast of Pelion, was based at Aphetæ, at the southern tip of

the Pelion promontory. In the fourth century, the Magnesians fell successively under the sway of the tyrants of nearby Pherae in Thessaly, the Boeotians, and Philip II of Macedon. When Demetrius I Poliorcetes founded Demetrias around 290, he brought much of the population of Magnesia into the new foundation, and the area remained under Macedonian sway until 196, when the Romans declared Magnesia independent. Demetrias later headed an independent Magnesian League, though there were further periods of Aetolian and Macedonian control.

Magnesia, Battle of (190)

After the defeat of Macedon at the battle of Cynoscephalae (197) the only Hellenistic power strong enough to threaten Roman control of Greece was the Seleucid Empire. Its king, Antiochus III the Great, invaded Greece on assurances that the Greeks would join him to throw off the Roman shackles. However, the support did not eventuate and after defeat at Thermopylae (191) Antiochus fled to Asia Minor. After the Seleucid navy was beaten at the battles of Side and Myonessus (190), a large Roman army, with forces from Rhodes and Pergamum, crossed the Hellespont. It was led by the Consul Lucius Cornelius Scipio, accompanied by his elder brother Publius Cornelius Scipio Africanus, the conqueror of Hannibal at Zama. This led to a decisive battle in 190 at Magnesia ad Sipylum (Magnesia near Mount Sipylus), in Asia Minor. Antiochus might have won the battle except for Eumenes II of Pergamum's cavalry support to the Romans.

The Romans had 25,000 infantry, 3,000 cavalry, and 16 elephants. Antiochus had 60,000 infantry, over 12,000 cavalry, and 16 elephants. More specifically he had 16,000 *sarissa* phalangites in the center; toward the right wing were 1,500 Galatian heavy infantry, 4,000 heavy cavalry, 1,200 horse archers, 10,000 light infantry, and 54 elephants. Toward the left wing were 3,500 Galatian and Cappadocian heavy infantry, 2,700 auxiliaries, 4,000 heavy cavalry, scythed chariots and camels, 2,500 light cavalry, and 24,000 assorted light infantry.

Antiochus had fortified a position across a river and after a few days of inaction, the Romans moved nearer, securing their left flank with the river (they lacked enough cavalry to protect both flanks). The battle saw victories on the right wing of each army. Despite being outnumbered almost three to one Eumenes crushed Antiochus' left wing through his aggression, first using light troops to nullify the chariots and camels and then in the disorder charging with his 3,000 heavy cavalry to rout the rest down to the phalanx. In the center, the Seleucid phalanx was able to hold off the Roman infantry until forced by Eumenes' cavalry to edge behind their fortifications. On the other flank Antiochus personally led a decisive heavy cavalry charge to rout the Roman infantry on the left wing, resting on the river. Unfortunately, rather than turn and attack the exposed Roman flank and relieve his phalanx in the center Antiochus pursued too far. The Roman camp guard of 2,000 infantry rallied the retreating men and, aided by 200 cavalry brought by Eumenes' brother from the other wing, counterattacked Antiochus. The enthusiasm of this small force and the defeat of most of his left wing prompted Antiochus to flee and the rout spread to the rest of the army including the victorious phalanx in the center. Antiochus reportedly lost 50,000 infantry and 3,000 cavalry while the Romans only lost 350 men. Antiochus' defeat at Magnesia did not win any real territory for Rome but it paved the way for later eastward expansion and made Antiochus submit to the power of Rome.

Magnesia on the Maeander

Magnesia on the Maeander was one of two cities called Magnesia in Asia Minor; the other, identified as "Magnesia ad Sipylum," was the location of a major battle in 190. The site of Magnesia on the Maeander visible today is situated at the base of Mount Thorax, near the Lethaeus River, a tributary of the Maeander. The unknown site of the original city was probably closer to the Maeander, but was moved either for defensive reasons or to escape the silting of the river in the early fourth century. Rich in fertile alluvial land, the original city had been gifted to the exiled Themistocles in the fifth century by the Persian king, Artaxerxes I, to supply him with grain: it yielded 50 talents per year until his death. Magnesia apparently had a military focused on cavalry.

Magnesia's experience of conflict according to most sources was poor. The earliest reference to conflict is contained in a fragment of the seventh century poet Callinus, suggesting that Magnesia was engaging in successful conflict against Ephesus, though there are also references to an Ephesian victory over Magnesia.

Magnesia was later ravaged by the Persian commander Mazares in the sixth century. It remained under Persian control in the fifth century, and was sometimes used as a base by Tissaphernes during the Second Peloponnesian War. Captured from the Persians in 391 by the Spartan Thibron, the unwallled city was then moved to its new site near Mount Thorax. Magnesia surrendered to Alexander in 334 and to Rome in 190. With even the new site eventually buried under alluvial mud, much of Magnesia was well preserved into modern times.

Malis, Malians

Malis was a small region in central Greece, consisting of the flat agricultural plain of the lower Spercheios River, around the end of the Malian Gulf, and the hills on either side. The chief cities were Lamia, on the north side of the plain, and Trachis on the south side. On the east, south of the gulf, was the major sanctuary of Demeter at Anthela, close to where the pass of Thermopylae led into eastern Locris. Anthela was one of the two sanctuaries controlled by the Delphic Amphictyony, and the Malians were a member *ethnos* (tribe) of the Amphictyony. There may have been at least a loose political federation of Malian cities, as they often seem to have acted in concert.

In 480, the Malians medized, though with Xerxes’ army camped in their territory they scarcely had any choice. According to one story, the man who showed the Persians a route around the position at Thermopylae, leading to the Greek defeat, was a Malian, Ephialtes. In 426, the people of Trachis, at war with their neighbors on the west, the Oetaeans, sought help from Sparta. The Spartans responded by founding a new city, Heraclea Trachinia, nearby, to help the Trachinians and to be a secure point on the main route by land to the north. Indeed, Brasidas passed this way in 424. The other Malians, however, opposed the foundation and made constant war against it. The city fell into *stasis* in 399, and survived having its walls pulled down by Jason of Pherae in 371.

With the decline of Heraclea, Lamia became the main city of Malis. In 323, the Macedonian regent, Antipater, used Lamia’s fortifications as a safe

refuge while his army was besieged by the Athenians and their anti-Macedonian allies. The failure of the four-month siege, which ran into early 322, was the decisive turning point of the war. Between 280 and 188, Malis was part of the Aetolian League. Lamia was besieged by Philip V of Macedon in 208, again in 190, when it served as Antiochus III's headquarters in his war with Rome, and was plundered by the Roman Manius Acilius Glabrio.

Mantineia, Battle of (418)

A land battle fought near Mantineia in Arcadia in late summer 418, between the Peloponnesian League and a coalition of Argos, Athens, Mantineia, and Arcadians. The action occurred during the period of supposed peace in the Second Peloponnesian War (431–404) following the Peace of Nicias. The Spartan king Agis II, accompanied by 10 "advisors" to supervise him after his poor performance in Argos earlier that year, was attempting to reassert Spartan authority in the Peloponnese against Argive moves (supported by Athens) to create an effective anti-Spartan coalition there. Agis' immediate aim was to relieve the other main Arcadian city, Tegea, which was on the verge of defecting from Sparta under pressure from the coalition army.

Agis drew the coalition forces away from Tegea by invading Mantineia. He narrowly avoided a looming disaster when stung into reconsidering his attempt to make a difficult attack against the coalition force's very strong position on a hilltop. In an interesting example of Spartan questioning of authority, a veteran soldier (referring to Agis' recent much criticized

withdrawal from Argos without fighting) called out to him that he “was trying to remedy one evil with another” (Thucydides 5.65). Agis halted just short of the enemy and withdrew, to the bewilderment of the enemy generals who failed to exploit the opportunity.

The following day, under pressure from their troops, the coalition generals moved down to the plain. Thucydides gives a detailed description of the deployment but not the numbers involved (although noting that the Spartan force looked bigger). From his account, it is clear that the outflanking movement that won the battle for the Spartans, and which was attempted again at Nemea and Leuctra, was more by accident than design.

Agis opened up a potentially fatal gap in his front when trying to correct the natural rightward drift of hoplite armies by extending his left wing to the left and moving two contingents of Spartiates from the right to fill the gap. The two Spartan officers, judging they were too close to the enemy, refused to move. The Mantineans and Argives broke the now isolated Spartan left wing, causing considerable casualties and pushing the enemy back to their camp. However, on the Spartan right, the accidental outflanking of the enemy allowed the Spartans to turn in and catch them on their flank. The coalition right and center collapsed, with the Athenians escaping major casualties only because of the protection of their cavalry and Agis’ decision to return to aid his defeated left wing. The victorious coalition right wing suffered major losses from the intact Spartans as they tried to return to the fray.

Coalition dead were around 1,000, while the Spartans lost 300. Despite the element of luck, the Spartan victory effectively reduced the anti-Spartan movement in the Peloponnese, and Argos subsequently made peace.

Mantineia, Battle of (362)

This immense land battle of 362, involving some 50,000–60,000 Greek combatants, had deep repercussions for the Greek balance of power. The lead-up to the conflict began with differences among members of the Arcadian League (specifically Mantineia and Tegea), tension between the Arcadian League and Elis in the 360s, and the alliances of the various parties. Elis battled the Arcadians in 365 and 364 over borderlands. Arcadia supported one faction of Eleans desiring a new political system, then seized the panhellenic shrine of Olympia from Elis and occupied it.

Next, in 363/2, the Arcadians used sacred treasures at Olympia to finance a federal military, ignoring their pro-Spartan member state Mantineia's disapproval and going along with the approval of Tegea, another member-state whose loyalties lay with Thebes. The Arcadian assembly voted to not use these funds, which removed from the Arcadian federal army all persons who needed wages, leaving only better-off individuals. Tensions increased when Tegeans, aided by a Theban army, arrested Mantineans making peace overtures to Elis. The Mantineans protested this, and so the Arcadian League became divided. Tegea and Megalopolis remained allied with the Boeotian League and the Mantineans asked for help from Athens and Sparta.

In 362, Epaminondas brought a Boeotian League army to Nemea and then Tegea along with Thessalian and Euboean contingents, and soon divisions from Messenia, Argos, Euboeans, Thessalians, and Locrians alongside, of course, Tegea and Megalopolis. The Mantineans had help from Sparta, the Eleans, the Achaeans, and the Athenians. As a show of defiance against Sparta Epaminondas first attacked south, which most populations in his coalition resented; despite almost catching Sparta undefended, Epaminondas' troops were repelled by Agesilaus II. Epaminondas next went back up to Tegea. Hoping to win a decisive victory before leaving the Peloponnese, Epaminondas led the Boeotian–Tegean force against Agesilaus' coalition army at Mantineia.

Epaminondas died in the battle, although using innovative and clever tactics including, in addition to heavy hoplite phalanx in a "beak-like" formation, the innovative integration of light infantry and cavalry supporting each other. Sparta's military was weakened by the Spartiate demographic decline and by the losses suffered at the battle of Leuctra in

371, but was not defeated, partially because the Theban side did not press their advantage after Epaminondas' death. Both sides claimed victory. A Common Peace treaty resulted, the first called by this term and the first since 387/6 not involving foreign powers such as Persia; an inscription even refuses help to rebels from the Persian Empire. Sparta's refusal to be involved in the treaty was closely linked to Messenia gaining recognition as a legitimate political entity autonomous from the Spartan state.

Xenophon ends his *Hellenica* with this battle, throwing his hands up and complaining (justly) that everything became even more complicated after it. He correctly notes that neither side gained territory. He thus avoids the most significant (in terms of Aegean geopolitics) result of this battle: with Epaminondas' death, and the end of Theban hegemony, would come the successes of Philip of Macedon against an exhausted Greece.

Mantineia, Mantineans

Mantineia was a major Arcadian city, located in the northern part of the Arcadian plateau, about 2,000 feet above sea level. The city was, very unusually in Greece, located in the center of flat and marshy valley, astride a river. The urban center seems likely to have been a late foundation, with population brought in from a number of villages probably located on or against the surrounding hills. Whether Mantineia was politically unified before this *synoecism* is not certain. Siting the city in the valley was perhaps a matter of convenience, rather than military prudence. The city walls, nearly 2.5 miles (4 kilometers) long, had 10 gates, allowing easy access to the surrounding farmland. Defensively, there were 105 towers, and the location on the river, Hans van Wees has suggested, allowed animals to be brought in in time of attack.

Mantineia sent 500 hoplites to fight with the Spartans at Thermopylae in 480, but the Mantineans arrived late for the battle of Plataea the following year. There were other occasions when Mantineia supported Sparta, including at the battle of Olpae in 426/5. But in the 420s they extended their control over much of northern Arcadia, and in 421 broke away from Sparta and allied with Argos. After the Spartan victory at the battle of Mantineia in 418, the city was forced to give up its Arcadian ambitions. Relations with Sparta remained tense, and in 385 the Spartan king Agesipolis I attacked the city. He blockaded the city with a trench but, learning that the inhabitants had a large quantity of grain stored up, resorted to the tactic of damming up the river to flood the town and undermine the mud-brick walls. Fearing the consequences if the Spartans captured the town, the Mantineans agreed to terms: the walls were demolished, and the city broken up; the population moved back to their original villages. The city was refounded in 371/70, after the Spartan defeat at Leuctra. Lycomedes of Mantineia instigated the formation of a reborn Arcadian League, centered at the new foundation of Megalopolis. But conflict, especially with Tegea, led to war between the members, and the battle of Mantineia in 362, where Mantineia was supported by Athens and Sparta.

Mantineia's Hellenistic history is not well documented; at various times it was a member of both the Achaean and Aetolian Leagues. But in 223, Antigonos III Doson enslaved the population in retribution for its having massacred an Achaean garrison. The city was later refounded, and Mantineans fought for Octavian at the battle of Actium in 31.

Marathon, Battle of (490)

A defensive battle fought on the plain of Marathon in northeast Attica between an Athenian/Plataean army and the Persians. It ended the first Persian invasion of Greece, which had been mounted to punish the Athenians and Eretrians for aiding the Ionians during the Ionian Revolt. Herodotus states (6.94) that Darius' instructions to the commanders of the force, Datis and Artaphrenes, were to "enslave Athens and Eretria and bring the captives before him."

The size of the Persian land force is unknown, but perhaps a reasonable estimate is 25,000–30,000 (ancient writers give the usual exaggerated Persian numbers, ranging between 200,000 and 600,000). Eretria fell through treachery and the Persians crossed to the mainland to attack Athens. They landed at Marathon on the advice of Hippias, one of the Peisistratidae, who fled to Persia after his tyranny at Athens was overthrown. Marathon was an easy crossing from Euboea and offered suitable terrain for the large Persian army and its cavalry. The Athenians requested assistance from Sparta and marched northeast with around 10,000–11,000 hoplites (1,000 from Plataea).

The "war-archon" or polemarch, Callimachus held overall command, but the 10 *strategoi* (generals) were effectively in control, holding command in rotation for one day. The Athenian/Plataean force was in the foothills, to negate the Persian numbers, and the *strategoi* were divided over whether to defend or attack. Miltiades is reputed to have been the architect of the Athenian tactics and with Callimachus' support persuaded the Athenians to attack. The Athenians charged the Persians at the run, probably when they began to move south in the direction of Athens. The Persians were amazed at the attack by an outnumbered force unsupported by archers or cavalry. However, their own cavalry played no part in the battle—this was a mystery even in antiquity, but it may have been off scouting or already embarked on the ships (or, less likely, still on Euboea). The Greeks had weakened their center to extend their phalanx to cover the entire Persian frontage and the

Persian infantry broke though there. However, although outnumbered, the Greek hoplites proved superior to the Persian foot and the Greek wings pushed their opponents back and re-formed a solid line. A large part of the Persian force was surrounded and some 6,400 Persians died. The rest escaped on their transports, although seven ships were captured. The Athenian celebrations were cut short when a shield signal was seen on the hills above and the Persian fleet sailed south toward Athens. A forced march of 22–26 miles (35–42 kilometers) ensured they reached the city before the Persians, who then left for home. The 192 Athenians killed were, contrary to convention, buried on the battlefield. Their burial mound (*soros*) on the plain locates the epicenter of the battle. The Spartans arrived too late to take part. The battle became a key element of Athens' self-image and the veterans, the *Marathonomachoi*, held a special place in later Athenian tradition.

Mardonius (d. 479)

Mardonius was an Achaemenid Persian noble and general, who played a prominent role in the Second Persian War (480–479). Mardonius was the nephew and son-in-law of Darius I. Herodotus, our main source, provides a picture more literary than historical. Mardonius is shown as a driving force behind the decision to invade and, during the 480–479 campaign is portrayed as consistently spurring his cousin Xerxes on against the Greeks.

In 492, Darius sent Mardonius to organize the recently resubjugated areas of Asia Minor after the Ionian Revolt. Following this, he extended

Persian control across the Thracian coastline and the Chalcidice—an essential precursor to a land invasion of Greece. During the invasion of 480–479 he was one of Xerxes’ senior officers and was left in charge when Xerxes returned to Persia after Salamis. Mardonius commanded the Persians at the battle of Plataea and handled the preliminary maneuvers and skirmishing well. He quickly seized the opportunity to attack the Greeks when they were in a position of considerable disarray, but the attack was poorly coordinated. Mardonius was killed and his army defeated. He seems to have been a generally effective administrator and commander in the east, but he and his troops were outclassed at Plataea.

Mausolus and the Hecatomnids

The Hecatomnid dynasty ruled Caria, in southwestern Asia Minor, as Persian satraps for two generations from 392 to 334. The dynasty’s founder, Hecatomnus, was ordered by the Persian king to attack Evagoras of Cyprus in 391, but secretly aided him. His son, Mausolus, is the best-known member of the family. Mausolus reigned from 377/6 to 353/2 and is most remembered for his tomb in Halicarnassus, the Mausoleum, constructed posthumously by his sister and wife Artemisia, who reigned until 351/50. Mausolus moved the Carian capital from inland Mylasa to Halicarnassus

(modern Bodrum), a largely Greek city on the coast, enlarging the city by merging several discrete communities. He was open to Greek influences, while also preserving Carian religion and culture.

The dynasty was constantly involved in conflict. Mausolus conducted campaigns in Anatolia, attempting to take Miletus by subterfuge and succeeding in capturing Heraclea under Latmus. He also besieged both Assos and Sestos with a fleet of 100 triremes. From 362, he was involved in the later stages of the satraps' revolt, but returned to the Persian king's favor and remained satrap afterward. Demosthenes accused Mausolus of having instigated the Social War against Athens in 357, but in reality the extent of his involvement (including tangible military assistance) is uncertain.

After Mausolus' death, the satrapy passed to his wife Artemisia, who was said to have fought a war against Rhodes, then to his sister Ada via his brother Idrieus. Ada was expelled by her brother Pixodaros, who was succeeded by his brother-in-law Oronomates. Ada, however, cooperated with Alexander and, adopting him as her son, orchestrated her own forceful return to power.

Medicine, Military

A significant question in Greek military history is whether medical care was institutionalized in Greek military structures. In some periods, doctors were hired to accompany military campaigns, especially for the sake of leaders and wealthy members of campaigns. However, at the most basic level, soldiers would have no doubt attempted to ease their injuries and the injuries of their comrades, applying whatever medical knowledge (or lack thereof) that they had. In general, your personal wealth and rank in the

army probably affected your ability to access medicine in ancient Greek armies.

The ancient Greeks generally did not have doctors who were hired by the military. The lack of a standing army in most city-states meant that doctors were probably only hired occasionally to accompany military campaigns. According to Xenophon, the Spartans had doctors as part of the king's retinue. Xenophon also states that doctors were hired by generals to keep their men in good health. The same passage (*Cyropaedia* 1.6.14–15) also discusses the importance of avoiding unhealthy camp sites (alluding to circumstances such as marshy land, which could cause a variety of diseases). Similar themes are discussed in the Hippocratic corpus, a Greek collection of reference texts for doctors. The Greeks were aware of some environmental causes of disease and appear to have made attempts to avoid them.

Additionally, according to Xenophon, ordinary soldiers were selected to act as doctors. This does not seem to have involved much training; rather the soldier was appointed as a carer for wounded comrades while the army was on the move. We see Patroclus in Homer's *Iliad* removing an arrow and cleaning the wound for a fellow soldier, a skill that he has reportedly learned from Achilles (see illustration). This type of tale may reflect a reality on the battlefield, where soldiers passed on knowledge to their comrades and gained some level of competence in treating their own wounds and the wounds of others. However, in the case of infectious disease, this practice may have actually caused the spread of illness. Thucydides notes the unique misery associated with choosing to either abandon your comrade to a lonely death or risk contracting an illness yourself—a situation that eventually migrated off the battlefield and into mainstream Athenian society during the plague in Athens in 430, during the second year of the Peloponnesian War.

Achilles binds the wounded arm of his companion, Patroclus, in a scene from the interior of an Attic drinking cup, ca. 500. Although the scene is mythological, it would have been one familiar to men who no doubt tended each other's wounds on the battlefield. The cup, found in an Etruscan tomb in Italy, is now in the Altes Museum, Berlin, Germany. (VPC Travel Photo/Alamy Stock Photo)

However, being abandoned on the field while sick, injured or dying does not seem to be a phenomenon limited to soldiers who had infectious diseases. Often, the circumstances of war meant that there simply was no time for medical assistance. An example of this is the Athenian retreat from Syracuse in 413, where Thucydides, perhaps rhetorically, describes injured soldiers as more miserable than those who were already dead. As the retreat took place, injured soldiers begged their comrades for assistance and followed as far as they could, as uninjured or relatively uninjured soldiers simply had to abandon the wounded to save their own lives.

Much of the burden for getting the critically injured off the battlefield appeared to fall on friends and comrades. Certainly, some (particularly those with arm wounds) would have been capable of continuing to keep up with their uninjured comrades. Potentially, given the speed required and the resources available, some of the wounded might have been carried on litters, provided there was someone willing (or required, in the case of slaves) to carry them. Depending on the logistics of the campaign, there may have also been supply wagons available for carrying the wounded. The

wealthy will have had a distinct advantage here, as an injured cavalry member with an unwounded horse would also have a significant advantage over an infantryman.

Those soldiers who were abandoned on the battlefield generally will have succumbed to their wounds, been killed by enemy soldiers, or been captured. Wounded soldiers, once captured by enemy forces, will most likely have been sold into slavery or simply killed. Diodorus provides an account of prisoners of war being provided as sacrifices to the gods by the Carthaginians. However, by the Hellenistic Period prisoners of war could be ransomed, whether by the military or by their relatives and friends back home. It appears that the wounded who were captured in battle would have had some chance of getting back home, which was usually dependent on being ransomed or the establishment of a treaty. For those left injured but alive in a hostile area, chances of survival seem exceedingly low.

Even when circumstances provided an opportunity for medical treatment to take place, this did not always mean an increased chance of survival. The small number of doctors must have also constantly faced the decision whether or not to treat a particular patient. Some wounds were simply too dire for even a trained doctor to be able to make a difference, to the extent that medical texts actually instruct doctors to refuse to treat patients in such circumstances (in the civilian setting, this was to protect the doctor's reputation).

However, this does not mean that no palliative care existed on the battlefield. Other soldiers, especially those acting in a quasimedical role, would have made efforts to increase the comfort of the dying. Also, given that these men were somewhat less likely to be hindered by concerns about their professional reputation, they were probably more likely to attempt medical assistance in a case where it appeared that all hope was lost (such as a deep stomach wound, which would have almost certainly been fatal in a matter of days).

Even in cases where nonfatal wounds had time to be treated, if there were not enough doctors on a campaign, then many soldiers must have been left untreated or exposed to substandard care. This will have created the situation where some injuries could fester or worsen, leading to fatal or incapacitating consequences, especially when the medical assistance of other soldiers lacked expertise and resources.

Some individuals may have continued to participate in military duty

while wounded, as different areas of service make different demands. A commander might be missing an eye (like Philip II of Macedon), but his speech and mind were his most vital tools. A rower might have limited sight or have a clubfoot, but he could probably continue to row with those conditions. A cavalry soldier need not be able to walk long distances, but must be able to ride a horse. Hoplites and light armed troops probably had the highest level of physical fitness required to serve effectively, but we even hear of exceptions in this area. However, severe wounds (such as limb loss and blindness) would presumably have excluded individuals from military service entirely.

Megalopolis

Megalopolis (strictly *Megale Polis*, “Great City”) was a major new urban foundation in southern Arcadia created in the years 370–367. A large number (39 in one account) of small Arcadian cities were prompted by the actual or recent presence of a Boeotian army under Epaminondas to combine into an urban center capable of resisting Spartan aggression. Synoecism (*Synoikismos*) is the Greek term for such a physical relocation of cities to a new center. True to its name, Megalopolis covered some 350 hectares (1.3 square miles) and the circuit-walls extended for about 9 kilometers (5.5 miles). Its population, considerable at first, declined in the third century and unoccupied space within its walls gave rise to witticisms about the “Great Wilderness.” Modern estimates of its total territory range from 400 to 1,500 square kilometers (around 155 to 580 square miles).

Megalopolis became the capital, or at least the leading city, of the Arcadian League, which comprised all Arcadians hostile to Sparta. Notable

structures included the Thersilium, a roofed assembly-building of unusual design for meetings of the supreme governing body of the League, the “Ten Thousand” (not to be taken literally) and a theatre capable of seating 20,000 persons.

Megalopolis depended at first on its alliance with Boeotia. In 361, the year after the battle of Mantinea, Boeotia had to intervene to stop the secession of some malcontents. When Boeotian military power in the Peloponnese faded during the 350s because of the Third Sacred War, Spartan pressure made Megalopolis appeal to Athens in 352/1. Megalopolis later made an alliance with Athens in 342/1 when Athens was trying to build up resistance to the growing threat from Philip II of Macedon. At this point Athens had decided an alliance with the Arcadians was preferable to its previous alliance with their enemy Sparta. However, Megalopolis also made an alliance with Philip at about the same time and did not take part in Athens’ war against him (340–338).

Megalopolis resisted the revolt led by King Agis III of Sparta in 331 and did not take part in the Lamian War (323–322). In later times, it took the side of Cassander, passed in turn under the control of Demetrius I Poliorcetes and Antigonos II Gonatas, but liberated itself by 280. It remained consistently hostile to Sparta. The growing power of the Achaean League challenged Megalopolis’ dominance in Arcadia but in 235 its tyrant Lydiadas resigned his power and brought the city into the League. Megalopolis was sacked by King Cleomenes III of Sparta in 223 but revived to play an important part in the League. It produced three notable figures in League affairs, Lycortas and his son Polybius, the historian, and the military leader Philopoemen.

Megalopolis, Battle of (331)

Agis III of Sparta meticulously planned a revolt against Macedonian overlordship and asked for Persian assistance (333). He also issued an appeal to all Greeks to assert their freedom and gathered 30,000 infantry and 2,000 cavalry. Agis defeated the local Macedonian governor and garrison at Corinth. Antipater, the regent of Macedon, quickly resolved a brief insurrection in Thrace (one perhaps coordinated by Agis) and marched south with 40,000 men. The two sides met outside the Arcadian city of Megalopolis, which Agis was besieging. The battle occurred either after receiving news in Greece of Alexander III's victory at Gaugamela or just before. The battle was the last attempt by Sparta to establish a hegemony and the last attempt at any Greek resistance to Alexander's Macedonian rule.

The Spartans formed up on a hill and met the Macedonians who were cramped for room. The Spartan army fought for a long time and very fiercely but began to fall back. Agis' royal squadron charged and the Spartans forced the Macedonians back down the hill, but on the plain the weight of the Macedonian numbers told. Agis succumbed to multiple frontal wounds and his bodyguard carried him back to camp. The rest of the Spartans, regaining the advantage of the hill, resisted fiercely. Eventually Macedonian numbers told and the Spartans retreated in disorder. On being carried away and surrounded by the enemy Agis told his men to save themselves and he, fighting from his knees, challenged his assailants to combat, but they attacked him from a distance. He killed some of the enemy before finally being felled by a javelin. Over 5,300 Greeks were killed and 3,500 Macedonians (1,000 according to Curtius Rufus).

A *polis* on the Isthmus of Corinth, Megara had ports on both the Saronic Gulf (Nisaea) and the Corinthian Gulf (Pagae and Aegosthena); that fact, and its position on the isthmus, gave it some commercial and considerable strategic importance. Megara was an active and independent presence in the Archaic Period, but found itself eclipsed in the Classical Period by its larger neighbors (Athens, Corinth, and Boeotia). By the fourth century, Megara seems to have been committed to a program of peaceful neutrality.

Megara's territory was approximately 470 square kilometers (about 180 square miles), of which scholars estimate 20 percent was arable. Its population likely reached 40,000 at its peak, of which around 25,000 would have been citizens. During the invasion of Xerxes Megara could muster a hoplite force of 3,000 and a naval contribution of 20 triremes.

Megara coalesced as an independent *polis* during the eighth century, before which its five constituent villages were dominated by Corinth. During the eighth and seventh centuries Megara was heavily involved in the colonizing movement, founding colonies in Sicily as well as the Black Sea region. Megara experienced repeated border conflicts with both Athens and Corinth during the sixth century, as well as brief naval conflicts with Samos and Miletus. The Spartans passed through the Megarid repeatedly in the course of their late sixth century conflict with Athens, suggesting that they were allied with Megara at the time.

Although it stood aloof from early clashes with Persia, Megara was a member of the Hellenic League and a staunch supporter of the Greek cause against Xerxes. After the Persian War Megara remained a member of the Peloponnesian League with the exception of a brief period from about 460 to 446 during which it was allied to Athens. In the late 430s, the Athenians passed the "Megarian Decree," barring Megarians from all harbors in the Athenian Empire and from the Athenian Agora. This decree became one of the proximate causes of the Second Peloponnesian War. During that war Athens also repeatedly ravaged Megarian territory, causing significant economic damage.

Megara appears to have leaned toward a pro-Theban alignment in the fourth century conflicts between Thebes and Sparta. The sack of the city by the troops of Demetrius I Poliorcetes in 307 was a major blow. Megara joined the Achaean League in the 240s, the conditions of which included the concession of sovereignty over the ports of Pagae and Aegosthena and constitutional changes.

Megara, Battle of (458)

The battle of Megara was an Athenian victory over the Peloponnesian League early in the First Peloponnesian War (460/59–445). In dispute with Corinth, Megara left the League ca. 460/59 and allied with Athens. This was important to Athens, allowing it to protect its western border from invasion from the Peloponnesians. Consequently, when the Peloponnesians attacked Megara, the Athenians reacted quickly, even though they were already campaigning in Aegina and Egypt. The *strategos* (general) Myronides hastily levied an army from those normally too young or old to serve and marched west.

Details of the fighting are obscure—Diodorus Siculus records a fairly stock hard fought battle resulting in Athenian victory, while Thucydides (who is to be preferred here) records rather an inconclusive first engagement followed by a major victory 12 days later against a predominantly Corinthian force trying to set up a trophy on the original battlefield.

Whatever happened, the victory was a setback for the Peloponnesian League. It was also Myronides' first known success, contributing to his later ranking by writers such as Diodorus Siculus and Plutarch as a leader alongside Solon, Miltiades, Themistocles, Aristides, Cimon, and Pericles. The battle was celebrated by later generations as the famous battle where “the oldest and youngest” triumphed over the Peloponnesians.

Meleager (d. 323)

Meleager, son of Neoptolemus, was one of Alexander the Great's commanders. He took part in the campaign against the Getae (335), commanded infantry at Granicus and Issus, and cavalry at Gaugamela, and served in all subsequent campaigns. Following Alexander's death, Meleager proposed that the succession should go to either Philip III Arrhidaeus or Hercules, son of Barsine, and led the infantry in support of the opposition to Perdiccas. Appointed co-regent with Perdiccas, Meleager was outsmarted and killed by his rival.

Melos

Melos is a small volcanic Greek island, situated on the western edge of the Cyclades in the Aegean Sea. From early prehistoric times, the island was involved in the trade of obsidian. Melos was settled ca. 700 and considered to be a colony of Sparta. It was for this reason that after the Persian Wars

Melos did not become a member of the Delian League. Melos remained a loyal ally of the Spartans, although in the first part of the Second Peloponnesian War it remained neutral. However, the Melians actively sided with Sparta after Nicias led an Athenian force of 60 ships and 2,000 hoplites in an unsuccessful attack on the island in 426.

In 416–415, during the second phase of the Second Peloponnesian War, the Athenians attempted to force the Melians to join the Delian League. This was probably as much about the challenge that the mere existence of an independent Melos posed to Athenian status as it was about any intrinsic strategic value Melos possessed. The Athenians landed a force of just under 3,000 hoplites, 300 archers, and 20 mounted archers (*hippotoxotai*) on the island; they then sent ambassadors to the Melians to negotiate their terms. The Athenians announced that they would spare the island on the condition that Melos would submit to the Athenian demands and pay them tribute. Otherwise, the Melians would have to face the complete destruction of their city-state. When the Melians refused their request, the Athenians organized a siege of the city. The Melians fiercely defended their city for many months but with the help of reinforcements and traitors inside the city the Athenians forced an unconditional surrender. The Athenians massacred every adult male and all the women and children were sold into slavery.

Thucydides presents in great detail the Athenian sacrilegious behavior in a dramatic literary piece, the so-called Melian Dialogue—one of the more famous passages in his history. The form of the dialogue—a point-by-point debate rather than a pair of speeches—is unique in Thucydides and has sometimes been seen as evidence of “notes” made by Thucydides that he later intended to turn into matching speeches. Thucydides uses the Melian Dialogue to reveal Athenian imperialism at its most naked, with its main message that “the strong exert their power and the weak submit.” Thucydides’ positioning of the Melian Dialogue immediately before the disastrous Sicilian expedition and the emphasis he gives to it have been interpreted as him deliberately presenting Athenian hubris and its resulting punishment. The Athenians afterward established 500 cleruchs, or military settlers on the island. After the defeat of Athens in 404, the Melian survivors were restored to the island by the Spartan general, Lysander.

Memnon and Mentor of Rhodes (ca. 380–333, ca. 385–340)

Often inaccurately described as simply a mercenary, Memnon of Rhodes was arguably the most dangerous opponent Alexander the Great faced during his conquest of the Persian Empire. An experienced military commander who had married into the Persian aristocracy, Memnon served the Persian Empire for most of his adult life.

Little is known of Memnon’s early life. He was born in Rhodes in or around 380 and is first mentioned in 358 as serving alongside his older brother Mentor under the Phrygian satrap Artabazus (the son of Pharnabazus). Mentor married Artabazus’ daughter, Barsine. In about 353, Artabazus rebelled against the Persian king, Artaxerxes, with Mentor and Memnon as two of his commanders. When the revolt failed, Mentor fled to Egypt, while Memnon and Artabazus went into exile at Pella, the capital of Macedonia. Mentor switched sides, betraying Sidon and Egypt to Artaxerxes, and was recalled to Persian service in 343, but died soon afterward.

Meanwhile, Memnon remained in Macedonia for three to four years, where he came into contact with the Macedonian royal family, including Philip II and the future Alexander the Great, who was seven years old at the time. Plutarch claims that Memnon and Alexander spoke at great length, with the young crown prince asking serious questions about Persian military strength, tactics, and dispositions. The details of Memnon’s conversations with Alexander cannot be confirmed, but whatever

impressions if any the young prince made on the Rhodian, Memnon's time in Pella enabled him to observe Philip as ruler, diplomat, and military commander. More importantly, it convinced him of Philip's intention to invade Persia. Also, unlike his Persian counterparts, Memnon came away from Pella with a clear understanding of Macedonia's military capabilities.

Through Mentor's influence, Memnon was recalled to Persian service, and when Mentor died Memnon in turn married Barsine. In 339, Memnon helped repel an assault by Alexander's father, Philip II of Macedon, on Byzantium. In Macedonia, Memnon had gained a sense of the political intrigue that plagued Macedonia's newly established hegemony over Greece, and the depth of Greek antipathy to Macedonian rule. Thus when Alexander invaded Persia, Memnon urged Darius to take the initiative by using Persian gold to foment rebellion in Greece. Darius initially rejected that advice, but after the Persian defeat at Granicus awarded Memnon command of the western satrapies. Memnon organized the defense of Halicarnassus when Alexander besieged the city, and was nearly successful. More importantly, he employed Persia's naval superiority to initiate an island hopping campaign and negotiations with Sparta to take the war to Greece by sea. Unfortunately for Persia, Memnon died besieging Mytilene in 333, but his amphibious campaign and the Spartan-led insurrection he incited posed the greatest threat to Alexander's rule since he became king. Had Memnon lived, Alexander might have been forced to abandon Asia Minor and return home to defend his throne. As it was, Memnon's near success drove Alexander to eliminate the threat by conquering Phoenicia before driving into the Persian interior.

Memnon's widow, Barsine, later became Alexander's mistress and gave birth to a son, Heracles, who briefly contested for Alexander's throne. Alexander's admiral Nearchus married Barsine's daughter by Mentor, and initially supported Heracles' bid for the throne, but met with no support. Barsine and Heracles were murdered by Polyperchon in 309.

Mercenaries

Mercenaries played an integral role in the warfare of the ancient Greeks from earliest times to the Hellenistic monarchies. However, although men who served purely for profit rather than for honor or fidelity must have existed since the earliest times, the ancient Greeks never had a term that explicitly identified a mercenary.

The first mercenaries of Archaic Greece probably emerged in the Homeric culture of reciprocal relationships and aristocratic friendships known under terms relating to *xenia* (guest-friendship). *Xenoi*, technically foreigners, ranged from friends and allies to mercenaries. Homer also calls some of the allies of Priam at Troy *epikouroi*. The *epikouros* resembles closely the mercenary or ally, a foreigner literally fighting alongside those directly involved in a war. The poet Archilochus identifies himself as such an *epikouros* and *epikouroi* appear quite commonly in Herodotus in the service of others. Importantly, Herodotus (2.152, 163.1–3) styled the 30,000 Carians and Ionians who found service with Psammetichus in 664 as “*epikouroi*.” Such *epikouroi* served in foreign armies as late as the late fifth and early fourth centuries. Arcadia was one of the main sources of Greek mercenaries in classical antiquity—according to Xenophon’s *Hellenica*, Lycomedes the Arcadian asserted that whenever anyone wanted *epikouroi* they came to Arcadia. *Epikouria* and *xenia*-relationships brought allies together in service, even though such terms hid the mercenary nature of the relationship. Inevitably, booty and profits accrued at the conclusion of

hostilities were shared among the successful combatants.

In the late sixth century, the spread of coinage as a form of money in the Greek world transformed military relationships. Coins emerged simultaneously and symbiotically with more blatant mercenary relationships. A new term also emerged for a man who took pay for service: the *misthophoros* (“wage taker” or “wage carrier”). In time, *misthophoros* displaced terms like *epikouros* and *xenos* in referring to mercenaries. Coins transformed all manner of military relationships. The coin taken as a wage (*misthos*) mitigated the need for a state or a general to divide up the booty at the end of a campaign, as had been the case with allies and guest-friends. Coinage, therefore, ushered in a new era of military service. The first large-scale wage earners appeared in naval contexts because of the requirements of Greek navies for thousands of oarsmen drawn from poorer status groups who needed payment to induce them into service. As the fifth century progressed, wage earners appeared more regularly in land armies, both as citizen-soldiers and as mercenaries. *Misthophoros* carried some stigma, especially for those in the service of others for payment, but it was not until the fourth century and later that sources talk in terms of foreign wage earners specifically as in the *xenoi-misthophoroi* found in later sources like Arrian.

The Greek *polis*-navies led the way in providing pay and opportunities for service to large numbers of increasingly professional oarsmen and specialist crews. The Athenian navy is a good example of this development. This navy had been hugely expanded after the chance discovery of a rich seam of silver (the basis of Greek coinages) and its crews received pay from as early as the Persian War period. As the fifth century progressed and Athens’ empire drew resources from the Aegean into the state, the navy became more and more coin-oriented and increasingly more professional oarsmen, both citizens and foreigners (*xenoi*), rowed for the Athenians.

Mercenaries provided useful support for the regimes of sixth century tyrants in Greek cities. Tyrants used coins to draw men from beyond the immediate aristocratic circle to their cause. Often these men came from beyond the *polis*. This was certainly the case for Peisistratus and we are told explicitly by Herodotus and the *Athenaion Politeia* that when he finally established his tyranny he did so with both silver from the mines of the northern Aegean and mercenaries provided by fellow tyrants at Argos and Naxos.

The fifth century saw increased monetization in the Aegean. The Athenian use of coined money as the medium of exchange within its empire for its system of tribute and its means of paying and maintaining its navy significantly increased professional and mercenary conditions. The Peloponnesian War of 431-404 added impetus to the increasingly professional and financial nature of warfare. Several speeches in Thucydides—even at the start of war—allude to the power of money as a means of attracting oarsmen in particular from the Athenian cause. Eventually, the naval crews of Persian-funded Sparta received coins in great quantities. Persian funds provided pay at a higher rate than those of Athens, luring mercenary oarsmen away from Athenian fleets.

The Peloponnesian War had seen a steady increase in mercenary infantry units and guards with tyrants, Persian satraps and some states on the periphery of the Greek world. The most important turning point in the history of Greek mercenary service, however, took place at the end of the fifth century. In 404, the Great King of Persia died, leaving his empire to Artaxerxes II. A younger brother, Cyrus, who had been instrumental in providing Sparta with the resources to defeat Athens, rose in revolt and had many of his Greek guest-friends (*xenoi*) and the Spartans as his allies bring men to him to overthrow the Great King. Xenophon, who served on this expedition recorded the story of how the Greeks followed Cyrus to the heart of the Persian Empire and defeated the Great King at Cunaxa only to see Cyrus himself killed, forcing them to return to the Greek world north via the Tigris and over the Caucasus Mountains to the Black Sea. This work, called the *Anabasis*, provides a very detailed account of a mercenary army in Asia, with information as to how the army was gathered, paid and organized.

Xenophon was a guest-friend of a Theban named Proxenus who was in turn a guest-friend of Cyrus. This set of relationships illustrates neatly the way that mercenary service worked in the Classical Period. Aristocratic friends of powerful people brought into service others with whom they were already connected. Local elites might bring large groups with them in a chain reaction not dissimilar, perhaps, to Homeric heroes bringing with them bands of men from home to serve in the armies of more powerful rulers who were their own guest-friends. The military structure of this army reflected that of the regular *polis*. Generals (*strategoi*) provided an inner council and link to the paymaster. File-leaders, usually translated as

captains (*lochagoi*), commanded the smaller contingents of varying sizes and the regular soldiers made up a large assembly that received information and heard debates and orders conducted by their high command in much the same way as the Athenian democratic assembly on the Pnyx.

Cyrus offered the men good pay for service, initially a Daric a month or about a drachma a day and bonuses on completion of the job. This would appear to represent a very good daily wage. Although pay rates varied, oarsmen and hoplites in Athens might expect between a drachma or (more commonly) half that; three obols. The men also received assistance with supplies—a market travelled with the army to assist them with food provisioning. The *Anabasis* represents a significant and transformative moment in mercenary service because of the numbers of men involved and the ambition of the enterprise more than the mercenary service itself. Over 10,000 Greek hoplites followed Cyrus deep into the Persian Empire to overthrow the Persian king. The importance of the hoplite was a driving force of mercenary service. The Persian elites served as cavalry and infantry generally armed with bows, short spears and small wicker shields (see illustration in Persian (Achaemenid) Empire entry). They could draw on ample levies of light-armed troops from their imperial domains. The Greeks offered them the hoplite or heavy infantryman, adding significantly to Persian military power.

The fourth century represents the great age of Greek mercenary service in the Mediterranean. Greek hoplites found themselves serving the governors of the western Persian Empire and the Great King in an increasingly less stable environment. Several wars fought for control of Egypt in the 380s, 360s, and 340s and an enormous satrapal revolt from 366–360 kept thousands of Greeks employed in mercenary service. Similarly, in the west, the great tyrant of Syracuse in Sicily Dionysius I employed mainland Greeks in his wars against his neighbors and more significantly against the Carthaginians. By 340 Carthage too had begun to employ mercenaries from mainland Greece. Finally, Alexander's conquest of the Persian Empire saw as many as 50,000 Greeks fight for the Persians, and a good number served Alexander as well. On the other hand, Greek cities began employing light-armed infantry from the northern Aegean, most notably the peltasts of Thrace, to augment their heavily armed hoplite forces. This movement of heavy infantry out of Greece and specialist light infantry into the mainland illustrates nicely that mercenary service was

demand driven as states sought to increase their power in arms in which they were weak. Even the wars of the Greek mainland saw increasing mercenary activity. The Third Sacred War over Delphi (356–346) saw the Phocians melt down the sacred treasures of the sanctuary into coins to employ thousands of mercenaries in their defense. The fourth century experienced much mercenary activity. Treatises appeared on how to employ mercenaries; philosophers and orators discussed them and their usefulness and at the same time lamented the loss of the past as a golden age of citizen-amateurs. That said, the citizen-hoplites still fought and died in defense of their states and all the major pitched battles of the century from Coronea to Chaeronea were fought primarily by Greek citizen soldiers.

Alexander's death and the wars of the Successors mark another turning point in the history of mercenary service. In the new circumstances of the Hellenistic Period and the new kingdoms created in the wake of Alexander's conquests, and the money that these had released into circulation from the vaults of Persia's treasuries, the generals sought to employ Macedonians and Greeks in as large numbers as possible. Rewards for service peaked again as competition for good soldiers increased exponentially. The absence of old national identities in this age saw professionalism more firmly rooted in military relationships. To this age belong the first contracts between paymasters, the emerging Hellenistic kings, and their men in the form of inscriptions. Such contracts were something new and soldiers were now professionals, tied to their kings and to their units. In this age, tellingly, the generic Greek word for a soldier—*stratiotes*—represents a professional and the citizen amateur requires definition.

As the Hellenistic monarchies became more established, the kings attracted soldiers to them with offers of pay and bonuses. In Egypt, the Ptolemies settled veterans on land. Initially this successfully bound men to the king, but the decline in Macedonian and Greek military strength in Egypt was stark in the third century, culminating in the need to enroll native Egyptians into the army that won at Raphia in 217. In Asia, the Seleucids enjoyed longer and more settled military stability through the use of military colonies of active servicemen. These colonies laid the foundations for a military class that replenished itself with each new generation. The core of the royal armies became established, embedded, and professional. However, mercenaries from outside the kings' domains continued to play important roles in the armies of the Hellenistic monarchs.

Peoples on the periphery of major powers provided specialists for the royal armies. Cretan archers, Balearic slingers, Thracian peltasts, and Galatian light infantry all saw service as the Hellenistic Period drew on.

Mesopotamia

Often considered the cradle of civilization, Mesopotamia is the area encompassing the Tigris and Euphrates river valleys; most of it is in present day Iraq. Mesopotamia was part of the so-called Fertile Crescent, a region of good agricultural land in an otherwise arid landscape. From the third to first millennia the area was home to groups such as the Sumerians, Akkadians, Assyrians, and Babylonians who, directly and indirectly, had a great cultural influence on the Greeks. From the sixth century the area was under the control of the Persian Empire, until Alexander the Great conquered it in 331. Babylon on the Euphrates was the great city of the empire, and also the place where Alexander died in 323. In the Hellenistic Period, Mesopotamia formed part of the Seleucid Empire, before it was lost to the Parthians in the second century.

Messenia

Messenia is the large region in the southwest Peloponnese bounded by Triphylia and southern Arcadia to the north and separated from Laconia to the east by the Taygetus range. The region is hilly and has heavy rainfall. It has abundant pasturage and arable land, including one of the most fertile areas in Greece, the Macaria plain on the lower River Pamisus. The Spartan poet Tyrtaeus described Messenia as “good to sow and good to plough.”

In the eighth century, Messenia was conquered by Sparta in the First Messenian War (traditionally ca. 736–716) and its population mostly reduced to the status of Helots. A great revolt in the seventh century, the Second Messenian War (ca. 650–630), ended in failure and resulted in tighter Spartan control. A revolt ca. 465–456, the Third Messenian War, also failed. Messenian refugees were settled at Naupactus in Western Locris ca. 456 by Tolmides and served Athens in the Second Peloponnesian War. When the war ended they were expelled from Naupactus. Some are found serving as mercenaries with Conon ca. 396 (*Hellenica Oxyrhynchia* 20.3).

In winter 370/69 a Boeotian-led army liberated Messenia after invading and ravaging Laconia. A new Messenian state, one of the great achievements of Epaminondas’ leadership, was formed, with a newly built city on Mount Ithôme. This site had been the stronghold of Messenian resistance in the Third Messenian War. The new city, known as Messene, was protected by a 6-mile (9.5-kilometer) circuit of fortification walls, constructed to the highest contemporary standards of town-fortification. The walls are the best surviving example of fourth-century fortification (see

first illustration in Fortifications entry). Messenia also included a number of towns that had been *Perioikoi* under Spartan domination. The relationship to the Messenian state in Hellenistic times of such places as Asine, Corone, and Mothone is not certain.

The bitter hostility of Sparta to the new Messenian state forced it to rely upon the protection of its ally Boeotia. When the Third Sacred War (356–346) limited Boeotia's capacity to assist, Messenia turned elsewhere for friends. It made an alliance with Athens in about 355 but, despite a later alliance with Athens and thanks to Philip of Macedon's careful cultivation of it from about 348 on, opted for prudent neutrality when Athens and its old friend Boeotia went to war with Philip (340–338). After the battle of Chaeronea (338), Messenia was a favored ally of Philip's. Messenia joined the anti-Macedonian side in the Lamian War (323–322).

Messenia was caught up in the power struggles of the generations after Alexander the Great's death. Cassander attacked it in 316 and Demetrius Poliorcetes in 295. Faced with continuing hostility from Sparta, Messenia was also often on bad terms with its Arcadian neighbors, mainly because of disputes over territory that was absorbed into the new foundation of Megalopolis. The failure of Messene and Megalopolis to form a common front against their enemy Sparta illustrates how common bad relations between neighboring Greek states were.

Messenia was also opposed to the growing power of the Achaean League in the Peloponnese in the late third and early second centuries. The reasons for this are not clear. Messenia was often allied with the Achaean League's enemies, Elis and Aetolia. Messenia was never a decisive force in Peloponnesian affairs and was often a source of instability because of its feuds. It was finally incorporated by force into the Achaean League in 182 (Polybius 23.17).

Messenian War, First (ca. 736–716)

The First Messenian War refers to the Spartan conquest of Messenia in the eighth century. It lasted for 20 years and was fought by “our fathers’ fathers” according to the Spartan poet Tyrtaeus (ca. 680–620), quoted by Pausanias (4.6.5) and traditionally dated 736–716. The Spartan subjugation of Messenia about this time is historical fact. The detailed narrative given by Pausanias is part of a patriotic Messenian history fabricated well after the liberation of Messenia in 370/69.

Messenian War, Second (ca. 650–630)

The Second Messenian War refers to a great rebellion by the Messenian Helots against their Spartan overlords in the seventh century and is traditionally dated ca. 650–630. That it reportedly lasted 20 years, the same as the First Messenian War, should worry historians. Even more so should the fact the main source is the elaborate and detailed narrative given by Pausanias, author of a learned travel-guide, *Description of Greece* (lived ca. 150 CE).

Pausanias says (4.15) that he had to choose for his accounts of the Messenian Wars between two sources: Myron of Priene (a third-century historian) and Rhianus of Bene in Crete (a third-century epic poet, author of various lost epics on early history). Why Pausanias chose these two, and

not, say, the standard historical work of Ephorus is to do with the way writers of his day cultivated out-of-the-way erudition. A more pressing historical problem is raised by Pausanias himself: Myron assigned the legendary Messenian hero Aristomenes to the First War while Rhianus assigned him to the Second. The wars are too far apart in time for one man to be in both, and Pausanias preferred Rhianus. However, stories could easily cluster around a legendary Robin-Hood-like figure such as Aristomenes, without any historical basis.

That Messenian folk-memory preserved stories of the great rebellion is likely. That these stories preserved detailed, accurate accounts of alliance-making (and breaking), battles and the feats of individuals is extremely unlikely. It goes against all that is known of orally transmitted traditions in the absence of written historical records.

Possibly some authentic memories are preserved in the mass of tradition that Pausanias records. Exploits of Aristomenes, the gallant leader to the end of the failed resistance, would be lovingly remembered, but freely embroidered and expanded. Memories of the place-names of great battles, such as the battle of the Great Trench (Pausanias 4.17.2) might survive but little else that is authentic. To use the accounts of the First and Second Messenian Wars for the history of hoplite warfare or anything else is naïve.

Messenian War, Third (ca. 465–456)

The Third Messenian War marked a critical stage in Greek diplomatic history. What began as a Helot revolt grew into the dissolution of the

Hellenic League, the alliance that fought the Persians, and the inception of the open hostilities that ravaged Greece throughout the rest of the fifth century.

At some point between 469 and 464, a destructive earthquake hit Sparta, devastating the city and leaving its citizens vulnerable. Many Helots used the opportunity to revolt, citing the continued Spartan mistreatment of their people. Along with the *Perioikoi* of Aethaea and Thuria, the Helots moved west and gathered in their traditional homeland of Messenia. The Spartans attempted to end the rebellion by sending Arimnestus, the man who supposedly killed Mardonius at the battle of Plataea, with 300 picked men to Messenia. At the short battle of Stenyclerus, Arimnestus and all 300 Spartans fell to a well-organized, and much larger, Messenian army. The Messenians were well trained in the Spartan way of war, as many likely fought at Plataea alongside Arimnestus.

Sometime after the battle, the Messenians moved to a well-fortified position on Mount Ithôme. With their city in ruin and the rebellion growing stronger, the Spartans appealed for help from allies, most notably the Athenians, who were more skilled in siege warfare. The Athenians responded by sending a large force of 1,000 under Cimon, but their involvement could not sway the war.

The Spartans then became paranoid, thinking that the new political policies of the Athenians might eventually have them side with the rebels. Unceremoniously, the Spartans dismissed the Athenians while keeping the rest of the allies in place. The Spartans contended that they simply no longer needed the assistance of the Athenians, but the Athenians caught wind of what they thought were unwarranted Spartan suspicions. Upon returning to Athens, the Athenians immediately broke the alliance with Sparta that had been formed against the Persians (ca. 481) and allied themselves with Sparta's traditional Peloponnesian enemy, Argos. They also allied with the Thessalians and the Megarians, and began construction of defensive works in preparation for war with Sparta.

Meanwhile, the Spartans continued their siege of the Messenians. After a prolonged affair, the two sides came to terms. The Spartans allowed the Messenians to safely leave Mount Ithôme on condition that they were not to return to the Peloponnese. Seeing another opportunity to work against the Spartans, the Athenians settled the Messenians in the strategic position of Naupactus, a city taken from the Western Locrians and located on the north

coast of the Gulf of Corinth. In that location, the Messenians would prove to be a valuable asset for the Athenians throughout the Peloponnesian Wars.

Metic

A metic (Greek *metoikos*, plural, *metoikoi*) was a formally recognized resident alien or foreigner. Although they existed in other states (Sparta is an exception), the best evidence is for Athens. There, metics paid a special tax that entitled them to live in Athens, with civic obligations but limited rights. A metic was registered in the deme where he lived and had to have a *prostates* or sponsor who was a citizen.

Metics were eligible for military service and some liturgies (compulsory public functions involving service and/or expense)—but not being a trierarch. They contributed to the *eisphora* (war tax) when it was levied. A metic could not legally marry a citizen or (unless they had a special exemption) own land or a house. What they gained was permanent residency, protection in the courts (there were fines for unsuccessful prosecutions of metics), and financial equality with citizens. Many were involved in commerce or manufacturing.

Metics could be vulnerable in times of crisis. For example, under the Thirty Tyrants wealthy metics seem to have been particularly targeted for arrest and execution. Although largely a means of raising money, it seems likely that the fact they were non-Athenians (or even non-Greek) was a factor.

Miletus

Miletus was one of the most prominent *poleis* in Archaic Ionia. The settlement lay on the coast, on the southern side of the Gulf of Latmus, near the mouth of the Maeander River. Today the site, in modern Aydın province in Turkey, is several kilometers inland, as silting by the river has turned the gulf into a broad plain nourishing cotton crops. The site of Miletus was situated on generally flat ground with a small hill, Kalabaktepe, to the south. The earliest Bronze Age settlement had been on an offshore island, giving protection from threats from the mainland. By the Late Bronze Age, the settlement had moved to the mainland, where a small peninsula flanked by two good harbors was fortified. In the Archaic Period, in the seventh century, walls were erected on Kalabaktepe.

Miletus was famous for its wealth, and was one of the major Ionian contributors to the Delian League in the fifth century. Its military power was great, and it contributed 80 ships to the battle of Lade in 494. Even in the Late Bronze Age, the Hittites knew Miletus as a formidable neighbor. In its prime, Miletus controlled an extensive territory of between 150 and 2,000 square kilometers (around 60 to 770 square miles), and established a reputed 90 colonies in the Aegean, the Black Sea and elsewhere. By the late Archaic Period, especially in the sixth and early fifth centuries, Miletus had become the most important intellectual center in the Greek world, and was home to several prominent pre-Socratic philosophers.

In the late sixth century, Miletus suffered, according to Herodotus, a series of annual Lydian invasions, but withstood these due to its fortifications and its control of the sea. In 499, Aristagoras, the tyrant of Miletus, instigated the Ionian Revolt against the Persians. The revolt effectively ended with defeat at the battle of Lade in 494, at which Milesian naval supremacy was broken. After the battle the Persians besieged and sacked the city. Fifteen years later, Miletus fought on the Persian side at the

battle of Mycale in 479, but it was an uneasy alliance that culminated with Miletus betraying and attacking the Persians. After Mycale, Miletus joined the Delian League, and in 440 gained the League's protection against an aggressive Samos. On the other hand, Miletus revolted against Athens on two occasions, in 454 and 412.

Passing back under Persian control after the Second Peloponnesian War, Miletus never regained its former strength. Its most enduring conflict then was not with foreign powers, but with the water that sustained it, as the progradation of the Meander River into the Gulf of Latmus slowly transformed the ocean into land, prompting territorial conflict with neighbors such as Myous. Miletus resisted Alexander the Great in 334, but was captured by force. Passing back and forward among large powers through the Hellenistic Period, it eventually ended up under Roman rule, where it endured as an important site until the Maeander eventually reduced the harbor of Miletus to a muddy swamp.

Miletus, Battle of (411)

The battle of Miletus was an Athenian victory during the Peloponnesian War (431–404). An Athenian force under Phrynichus, Onomacles, and Scironides, consisting of 3,500 hoplites (including 1,000 allies and 1,500 Argives—500 of whom were light troops provided with Athenian armor)

was attempting to secure the strategic coastal city of Miletus. The Milesian force consisted of 800 hoplites, supported by an unknown number of Peloponnesian hoplites, mercenaries, and Persian cavalry under Tissaphernes. Alcibiades fought alongside the Milesians. The Argives, advancing overconfidently, were routed by the Milesians, losing around 300 men, but the Milesians withdrew when the Athenians drove back the Peloponnesians and Persians. The Athenians set up a trophy and began to besiege the city but withdrew when they learned of an inbound Peloponnesian relief fleet. Thucydides comments favorably on Phrynichus' prudence in avoiding battle—in contrast to his colleagues who wished to stay and fight.

Miletus, Siege of (494)

Toward the end of the Ionian Revolt (499–493), the Persians attacked Miletus, the epicenter of the rebellion. As supplies could be brought in by sea the presence of the Ionian fleet at nearby Lade precluded an effective siege. However, when this fleet was defeated, the city was subject to a full investment by land and sea. The details are scant, but the Persians used a variety of tactics, including undermining the walls, to take the city. Most of the male inhabitants were killed and the women and children enslaved; some survivors were relocated to the mouth of the Tigris River on the Persian Gulf. The Persians retained the city and surrounding plain but gave the hilly parts of the Milesian *chora* to local Carians.

The Athenian tragedian Phrynichus wrote a play about the capture of Miletus—one of the few known about a contemporary event. Although the play does not survive, it was apparently so moving that the Athenians fined Phrynichus for the distress he had caused and banned further performances. After the loss at Lade and the siege of Miletus, the Ionian Revolt was

effectively over apart from mopping up.

Military Service, Greek States and

All Greek states in the Classical Period, including Athens, fielded contingents of hoplite infantry drawn exclusively from the citizen body, who were armed for hand-to-hand combat with a spear, usually protected by bronze or composite body armor, and always carried a large round shield (see illustrations in Hoplite entry). These soldiers and their equipment were especially well adapted to fight in what was known as the phalanx formation—a tightly organized battle formation usually composed of eight parallel ranks and as many files as there were men to fill them (see first illustration in Phalanx entry). Universally in the Greek *poleis* of the fifth century, citizens who could afford the cost of the hoplite’s equipment were required to serve the state throughout all of their adult lives. In Athens, for example, men whose families met a certain property qualification were enrolled in the ranks of the hoplite force (*catalogus*) at the age of 18 and could be called on to serve until they reached the age of 60. In return, Athenian hoplites were entitled, expected, and in some cases required to participate directly in the political life of the state.

Most believe that hoplites represented a kind of “middle class” in most Greek city-states during the Archaic and Classical Periods (700–323), consisting largely of independent farmers and landowners. As a propertied class in the state, these citizens would have been able to afford the cost of the weapons and armor and were capable of absorbing the economic strain of prolonged absence from home during the campaigning season. The loss of

the hoplite's labor on the family farm, it is thought, could have been offset by the labor of slaves who would have been owned by moderately prosperous households. Furthermore, many believe that as the hoplite phalanx became the dominant force on the battlefields of Archaic Greece, those who fought also came to dominate the political field, developing a sense of class ideology and solidarity that ultimately forced the local aristocracies to cede power.

In democratic Athens, where political distinctions between property classes gradually diminished, military class distinctions always remained important, at least as long as individuals were responsible for supplying their own equipment. Even at Sparta, where all adult male citizens were provided with weapons, armor, and extensive training, citizens were nonetheless required to contribute a significant amount of food and drink to the public messes.

Other oligarchic states also tended to align political rights with the obligation of military service. Military service was compulsory for the politically enfranchised, who could actually be fined for not owning the proper military equipment. In some states, those who did not meet a property qualification may even have been prohibited from possessing hoplite arms and armor, though they may have still performed voluntary military service as light troops (*psiloi*, *gymnoi*).

Prior to the fourth century, there is no evidence that Greek soldiers, other than the Spartans, received any formal military training. In his explanation of their military system, Xenophon implies that Spartan hoplites were capable of maneuvers, such as a unique counter-march technique, that no other Greek army could achieve. In the fourth century, there is some evidence that training had become a more common part of military service, such as the Athenian *epheboi*, though such training regimens may have been necessary due to the increasing use of more specialized and sometimes more professional soldiers, such as peltasts and mercenaries.

Some states also experimented as early as the sixth century with the use of specially selected and trained units of 300 men, kept under arms at state expense. At Sparta, they were known as the *Hippeis* ("Horsemen"), and at Thebes they were initially called the "Charioteers" and later reconstituted as the "Sacred Band." Athens too possessed a specially trained unit of 300 men, who Herodotus says scored a significant victory at the battle of Plataea (379)

against some Persian cavalry.

Although the evidence is sparse, sometimes hoplites attempted to evade military service. The frequency of evasion is not certain, nor is it clear how often individuals were prosecuted for it, but service evasion is routinely mentioned in Athenian forensic oratory, comedy, and drama, indicating it posed problems for the efficient mobilization of hoplites.

The remains of the Monument of the Eponymous Heroes, mid-fourth century, Agora, Athens. Bronze statues of the patron heroes of the ten Athenian tribes formed the centerpiece of this monument, where the Athenians posted public notices. These included white boards (see Document 6) listing the names of men called for service, or those tribes whose troops were to report for a campaign or expedition. (Photo by Iain Spence)

Miltiades I, Son of Cypselus (Sixth Century)

Miltiades was a member of the great Athenian family, the Philaids, and was a great-uncle of the fifth-century general, Cimon. Miltiades' father was an Athenian Cypselus, probably so named due to family connections with the family of Cypselus of Corinth. Miltiades was an Olympic victor in the four-horse chariot race. In the mid-sixth century, Miltiades left Athens at the invitation of the Dolonci, Thracians living in the Thracian Chersonese, to help defend them from marauding Thracians from outside the peninsula. He set up a personal fiefdom on the peninsula, with his base at Agora near the neck. To defend it, he built a wall across the narrowest part of the peninsula, from Cardia to Pactye. Herodotus suggests he did this because he did not want to live in Athens under Peisistratus, though Peisistratid policy was also interested in the Hellespont area. Making war on Lampsacus, on the other side of the Propontis, he was captured but released, according to Herodotus, through the intervention of Croesus of Lydia (this part is probably apocryphal). He died childless, and rule of the Chersonese passed to his nephew, Stesagoras, and thence to Miltiades II. After his death, the people of the Chersonese set up a hero cult for Miltiades.

Miltiades II, Son of Cimon (d. 489)

Miltiades, son of Cimon, was a member of the Athenian aristocratic house of the Philaids, and is most famous as the victorious general at the battle of Marathon in 490. He was the nephew of Miltiades I, son of Cypselus, the local ruler of the Thracian Chersonese. Miltiades I's successor, Miltiades II's brother, Stesagoras, was soon after murdered with an ax while fighting a war with Lampsacus. Miltiades' father, Cimon, had been murdered by the Peisistratids (sons of the tyrant Peisistratus), yet the Peisistratids now sent Miltiades out to maintain Athens' interest in the Chersonese. Miltiades' rule was less amicable than his uncle's: he used a ruse to seize the most powerful men from the cities of the Chersonese, and ruled with the aid of 500 Thracian mercenaries. He also married a Thracian princess, Hegesipyle, daughter of Olorus. (The historian Thucydides' father was also called Olorus, and was no doubt related to Miltiades' family).

When Darius I invaded Scythia in 513, Miltiades supported a Scythian suggestion that the Ionians break down the bridges over the Ister (Danube) River, leaving Darius trapped; but he was overruled by the Ionian tyrants, who owed their rule to Darius. Nevertheless the Scythians, stirred up by Darius' invasion, attacked the Chersonese, and Miltiades vacated his holdings for three years. Returning, in about 496 he took advantage of favorable winds to sail from Elaious to the island of Lemnos in one day, expelled the inhabitants, and acquired the island for Athens. After the failure of the Ionian Revolt, Miltiades again fled the Chersonese. A son by his first marriage, Metiochus, was captured and sent to Darius I, who treated him well and gave him land and a Persian wife; his children were regarded as Persians.

Miltiades returned to Athens, but there found himself brought to trial by his enemies on the charge of being a tyrant on the Chersonese. Acquitted, he was elected one of the 10 generals for 490/89, and thus was one of the commanders at Marathon. According to Herodotus, Miltiades' was the decisive voice in favor of fighting the Persians at Marathon, and was the commander on the day of the battle. With his new won prestige, the following year (489) Miltiades was given a force of 70 ships and laid siege to the island city of Paros, allegedly due to a personal grudge against a particular Parian. The 26-day siege was unsuccessful and Miltiades returned to Athens, having achieved nothing, and nursing an infected thigh wound

(incurred, according to a no doubt hostile story, while trying to burgle a sanctuary). Once again he was put on trial, this time by Xanthippus, the father of Pericles. Too ill to speak, he was defended by friends and relatives, who reminded the jurors of his services at Lemnos and Marathon. He was fined the enormous sum of 50 talents, but died soon afterward from his wound, leaving his son Cimon, the famous fifth-century general, to pay the debt.

Mithridates VI Eupator (Reigned ca. 113–65)

Mithridates VI Eupator was as an ambitious king of the mountainous and partially Hellenized Anatolian state of Pontus. His Iranian dynasty, having two centuries of ties with the Seleucids, had assumed some Greek cultural characteristics by the second century including the use of the Greek language for official matters. His father had assisted Rome against Carthage in the Third Punic War (149–146) and against Aristonicus' revolt (132–129) and was given Phrygia as a reward. He married a Seleucid princess and was assassinated in 120, at which point Mithridates inherited the Pontic kingship around the age of 11. He endured a number of murderous intrigues resulting in him killing his own mother and a brother. He obtained most terrain surrounding the Black Sea, gaining resources and soldiers. He took over Bithynia and Cappadocia while the Romans fought the Social War (91–87). Alarmed, Rome sent special legates to force Mithridates to recognize Bithynia and Cappadocia's respective kings and to remove his armies from these places, then urged Bithynia's king to invade Pontus and seize booty to compensate the Romans for their assistance. However, in 90 Mithridates defeated this king, attacked Pergamum and gruesomely killed a Roman

envoy. The period of 89–88 saw many cities in Asia Minor welcome Mithridates as *Soter* or Savior. He then built a fleet to attack Rhodes and ordered his satraps and the magistrates of the cities in Anatolia to order a simultaneous mass murder of all Romans and Italians of both sexes and all ages, and to share these victims' valuables with Mithridates. Slaves betraying or killing their masters were offered freedom; debtors killing their (presumably Italian) creditors were offered 50 percent debt-remission. Atrocities are reported for Ephesus, Pergamum, Adramyttium, Caunus, and Tralles among other cities. Later called the "Asiatic Vespers," the massacre involved between 80,000 to 150,000 casualties and sparked a swift Roman military response.

Support for Mithridates evidences a common anti-Roman attitude. Anti-Roman sentiment in the Greek East was surely aroused by usurious and extortive Roman tax collectors and a proliferation of underground anti-Roman literature supports this. We can conjecture that Mithridates helped mold this frustration into a resistance movement. However, Appian reports that the mass murders were sparked not only by hatred of Rome, but also by fear of Mithridates. Lucius Cornelius Sulla punished several Greek cities for supporting Mithridates, for example, looting Athens in 86, and defeated Mithridates thoroughly in 85. Shortly after this, Mithridates was made *amicus* of Rome, paid indemnities, and surrendered his Asia Minor acquisitions and warships. The Roman province of Asia was forced to pay ruinous indemnities. Mithridates rose again in the 70s, assisted by his son-in-law Tigranes. The Roman general Lucullus patiently warred for seven years against Mithridates, ejecting him from Pontus. Finally Pompey pursued him until in southern Russia in 63 he committed suicide, the last hope of the Greeks against the Romans.

Music

Sparta, as the most militaristic of the Greek city-states, is where we might expect to find evidence of the formal use of military music, and we are not disappointed. Ancient commentators noted the Spartans' use of panpipes and flutes in the ranks to keep the army "in step," as if this were an unusual practice in need of some explanation (e.g., Plutarch, *Lycurgus* 21; *Moralia* 238b-c). Plutarch even goes as far as to say that Lycurgus had made it a legal requirement.

A passage in Thucydides describes the use of music to keep order before the battle of Mantinea in 418 (see also the illustration in the "Chigi Vase" entry). After the sacrifices and the opposing generals had made speeches and the Spartan soldiers had sung their war songs, Thucydides (5.70) records the advance of the two armies into battle as follows:

... the Argives and their allies advanced with great fury, but the Spartans advanced slowly in step with their many flute-players. This custom was not a religious matter, but it was designed to help them keep in unison and to move forward steadily without breaking ranks, as great armies can do when they are confronting an enemy.

Many other cities also used music in battle. Most armies also sang war songs to settle nerves and build camaraderie. Before or during battle, the trumpet or conch could be used by leaders to sound an alarm or predetermined signal.

Music in ancient Greece was also found in the context of military celebration and rites following a victory. Xenophon records a famous moment when the Spartans celebrated the destruction of the Long Walls of

Athens in 404 with girls playing flutes. War dances were celebrated in honor of Zeus and other gods. *Korybantes* were male performers, who celebrated the Phrygian goddess, Cybele, by drumming, stamping, and dancing in armor. In Crete, there were *Kouretes*, who honored Zeus through a similar form of martial dance as part of a rite of passage for young men. The origin of the *Kouretes*, some said, is found in the myth of the birth of Zeus on Crete. To “shield” the cries of the baby from his father, Cronus, who wanted to eat his newborn son, the *Kouretes* clashed their shields and spears, sang and danced.

Mutiny

Mutiny is defined as collective, violent (actual or threatened) opposition to established, regular military authority. Given that definition, most hoplite armies, even Sparta’s, were insufficiently formal in terms of their discipline and punishments to have had the kind of regular authority one can mutiny against. The Macedonian army, however, did have formal discipline and penalties for misbehavior so there we find mutinies, expressions of grievances, and a couple of military conspiracies in addition to insubordination.

There may have been earlier incidents for which no record remains, but historians have traditionally called two incidents during Alexander’s campaign mutiny. One incident, the so-called mutiny at the Hyphasis, was not actually a mutiny because there was no threat of violence and no orders for the soldiers to oppose. This incident is actually another, less serious type of military unrest called an expression of grievances. These less notorious incidents were often insubordinate, but nonviolent, vocal confrontations or

communications in which soldiers typically sought to protest various grievances, real and illusory, and protect their interests. In this case the soldiers communicated their discontent by their silence and then through their officers. The soldiers were successful and during the march down the Indus Alexander restored order.

The Opis mutiny, the only actual mutiny, occurred in 324 when soldiers in Alexander's army mutinied over their discharge and replacement with Persians trained in the Macedonian manner of fighting. The infantry soldiers clamored loudly and even those who were not being discharged refused openly to serve further. In response, Alexander charged the ringleaders and had his bodyguards round them up and execute them. He then harangued the rest of the army and went forward with his plans. In response, the Macedonians begged forgiveness and accepted the reforms so that Alexander took them back and restored order.

The fact that Alexander encountered military unrest in his army does not detract from his reputation as a brilliant leader. Every army commander, even in hoplite armies, faced the threat of indiscipline; forces where discipline was important and enforced were susceptible to mutinies and other serious forms of military unrest. The resolution of such incidents and restoration of order was what distinguished good commanders. After 323, in the Hellenistic world, military unrest would prove to be a significant problem, but in the hoplite armies of Greece there was insubordination, but no incidents that meet the criteria for mutinies.

Mycale, Battle of (479)

The battle of Mycale was the final major engagement of the Second Persian War (480–479). Greek tradition dated the battle to September 479, the same day as the battle of Plataea, but this seems too coincidental to be true.

The Greek fleet under the Spartan king Leotychidas II at Delos was invited to Samos by locals, who guaranteed an easy victory. Herodotus records 110 ships there in 480, but they may have been reinforced (Diodorus has 250 in 479, but this seems too high). The Persians withdrew, beached their ships at Mycale (a promontory on the mainland, on the north of the Bay of Miletus), built a stockade around them, and linked with a 60,000 strong army under Tigranes. Diodorus Siculus records 100,000 men but this is probably a major exaggeration. Unless supplemented by rowers equipped as hoplites or men from troop transports not mentioned in the accounts, the ships’ marines (see illustration in Naval Warfare entry) comprised the sole Greek hoplite force. If so, at a maximum of 30 per ship (the usual complement was 14: 10 hoplites and 4 archers) the Greek hoplites can only at best have numbered between 3,300 and 7,500 and could not have faced a Persian army of this size. The Greeks landed and, encouraged by a rumor that the Persians had been defeated at Plataea that morning, routed the Persians. The Persians’ Ionian Greek allies defected during the battle, joining in the slaughter of the Persian fugitives. Herodotus emphasizes the Athenian role in the battle, while Diodorus has the Persians attack the Greek landing force. Herodotus’ account is probably to be preferred, but the most important aspect of the battle is its result.

Mycale confirmed Greek naval superiority in the Aegean and Hellespont and many of the Aegean islands defected to the Hellenic League. This enabled the Greeks to conduct offensive naval and amphibious operations against the Persians and laid the foundations for the Delian League and Athens’ subsequent maritime empire.

Mycenae

Mycenae, in the northeast of the Argolid, was such an important Bronze Age palace city that the four centuries of Greek history in which it flourished, are called the Mycenaean Period (ca. 1600 to 1100).

According to legend, Perseus founded Mycenae. In the *Iliad*, it is the seat of Agamemnon, commander of the Greek forces at Troy. Its impressive archaeological remains and preeminence in epic poetry may suggest that it was indeed the major Greek city of the Bronze Age. Homer describes the city as “well-built” and “golden” (*Iliad* 2.569, 7.180, 11.46). Its remains are consistent with this image. In the surviving written records of the Mycenaean palace communities, the Linear B clay tablets, Mycenae also appears as a leading city.

The famous Lion Gate (see illustration) marks the main entrance to the citadel through its cyclopean walls. There are also spectacular corbelled “beehive” tombs, known as *tholoi*. Heinrich Schliemann, who was also the first major excavator of Tiryns and Troy, excavated Mycenae in 1876. He revealed grave circles and rich funerary dedications, including the gold so-called mask of Agamemnon.

Destruction layers are apparent for the late 1200s and the demise of the citadel soon followed. Small contingents of Mycenaean troops fought in the major battles of the Persian War of 480–479, but, as with its Bronze Age neighbor, Tiryns, it was destroyed by the Argives, around 468. Argos seemed intent on appropriating Mycenae’s past glories for itself, as the new power in the region. By 150 CE, Mycenae was largely deserted.

James McDonald

The Lion Gate, the main entrance to the Bronze Age citadel of Mycenae. Built around 1250, the gate is named for the two lionesses depicted on the relieving triangle, which serves to reduce the weight on the 14-foot-long lintel. The structure, with its 9-foot-high doorway, remained visible throughout antiquity, and is mentioned by the second-century-CE traveler Pausanias. (Photo by Peter Londey)

Myronides (ca. 510–450)

Myronides was an Athenian general celebrated for two brilliant successes on land in the 450s. He commanded the force of “the oldest and youngest” Athenians that in 458 defeated Corinth and its allies in the territory of Megara. In 457, he defeated the Boeotians at the battle of Oenophyta, bringing all Boeotia except Thebes under Athenian domination. Memories of his brilliant generalship lived on in Athens in later generations.

Mytilene. See Lesbos

Mytilene, Siege of (428–427)

The siege of Mytilene, the main city in Lesbos, early in the Second Peloponnesian War (431–404), is mainly famous for the debate at Athens over the fate of the captive Mytileneans. Thucydides provides a detailed contemporary account of the operation, which was precipitated by the revolt of Lesbos (except Methymna) from Athens. Mytilene rebelled in 428, but their preparations were not yet complete when the Athenians got wind of the revolt and sent out a fleet. This blockaded Mytilene from sea while the Mytileneans sent to Sparta for aid. In early 427, a Spartan officer, Salaethus, arrived to lead the resistance and tell Mytilene that help was at hand. However, Mytilene surrendered before the relief fleet arrived. The city was out of food and when Salaethus issued hoplite equipment to the ordinary citizens with the intent of marching out to fight they refused to obey orders and demanded a redistribution of food. The Mytilenean leaders came to terms, allowing the Athenian army into the city. The Athenian commander, Paches, agreed not to kill or imprison anyone until a Mytilenean delegation made its case at Athens.

Thucydides records the debate at Athens in some detail, using it to set out two opposing views of empire and how to deal with revolts. Cleon, who

proposed that all adult male Mytileneans be killed and the women and children sold as slaves as a deterrent to others initially won the debate and a ship was dispatched with the orders. However, the next day the Athenians reconsidered and Diodotus' argument, that killing people who had surrendered would ensure that future revolts would be fought to the bitter end, prevailed. Interestingly, neither speaker addresses the issue of the morality of the punishment—the entire debate is framed in terms of realpolitik and what was best for Athenian interests. The second ship rowed day and night and arrived in Mytilene as Paches was reading the first decree but had not yet begun the executions. The population was spared, though over 1,000 ringleaders of the revolt were executed anyway. Athens demolished Mytilene's fortifications and took over its fleet. No tribute was imposed, but the land (except for Methymna) was allocated as plots to Athenians. The Lesbians continued to cultivate the land but paid a high rent to their Athenian landlords.

Naupactus

Naupactus was the most significant town of western Locris, situated on the north coast of the Corinthian Gulf, near its western end. Little is known about the city's early history; it seems to have increased in size around 500 with the arrival of new settlers from other parts of Locris. Naupactus had fertile land and access to good timber, but it was most valuable because of its strategic location close to the narrowest point of the Gulf, and its possession of a good harbor. The name itself means a place for building ships. In 456/5, after the fall of Ithôme, the Athenians removed the city from Locrian control, and settled Messenian exiles from the Peloponnese there. The existing inhabitants and the Messenians coexisted, forming a *sympoliteia* (a community formed by joining two groups). The Messenians at Naupactus were a useful source of hoplites for Athens, but Naupactus was most important as a naval base to disrupt enemy shipping, especially Corinthian, traveling along the Gulf. During the Second Peloponnesian War, it also made a useful base for raids on the Peloponnese. The Athenian general Phormio fought several engagements in the area in 430–429.

After the war, the Messenians were expelled and Naupactus given back to the Locrians. For parts of the fourth century it was an Achaean dependency, before Philip II of Macedon gave it to the Aetolians in 338. Thereafter, it became the main Aetolian naval base, until the second century when it came under Roman rule. The city long remained a significant port, called by the Venetians Lepanto, and was the Ottoman base at the battle of Lepanto in 1571.

Naval Tactics

Greek naval tactics included several different maneuvers that required skilled and disciplined crews to turn their ships into weapons. The main warship for two centuries, the trireme, was designed to be a weapon by utilizing the large metal ram fitted to the bow (see illustration in Naval Warfare entry). Larger ships of the Hellenistic Period, "fours," "fives," and others, carried more troops and mounted artillery pieces for greater lethality in close quarters. The largest ships described in the Hellenistic Period, "sevens" all the way up to one attested "forty" were almost certainly prestige pieces, and when they are described as being present in battle would have acted as command and control platforms more than offensive vessels. No matter the tactics used, all required clear and effective command and control to be effective. As Athens demonstrated time and time again, superior training and seamanship was able to overcome unfavorable odds.

The most basic of naval tactics was that of boarding, using hoplites and other infantry to board an enemy vessel to gain control of it. An Athenian trireme usually carried a complement of 10 hoplites and 4 archers, though this number varied over time and at the behest of different commanders. The greater size of Hellenistic vessels allowed them to carry more archers and artillery which could "soften up" an enemy ship before boarding. The Athenians relied on ramming tactics more than boarding, and consequently carried fewer marines than the ships of other city-states (who might carry two or three times as many). Boarding was the most basic of tactics: that does not mean that it was easy to effect or that naval battles devolved into mere land battles afloat. When the battle of Sybota in 433 became a contest between ships boarding one another, the historian Thucydides makes

specific note of this by remarking that it was not a battle employing the normal “science” of naval battle but was one of brute force. As a naval commander during the war, Thucydides was well placed to comment on naval tactics.

The first difficulty which the marines and missile troops who fought from the deck of a warship had to contend with was the inherent difficulty of doing anything on a moving and unstable platform. The deck was in constant motion and, depending on weather conditions and maneuvering, probably wet and slippery. This helps explain why all excess gear was removed before battle and left ashore, to clear up deck space as well as to lighten the vessel for speed. Also, unlike a conventional hoplite battle on land, the marines did not fight in a large formation like the phalanx and could not count on the collective protection provided by such a formation.

Secondly, the ship had to approach an enemy vessel without being rammed before they were in position. The great danger was that in approaching an enemy vessel the ship intending to board would be out-maneuvered by the enemy and rammed before the marines could engage. The ship was also at risk of being rammed by an enemy vessel even after successfully coming alongside and boarding, or being left vulnerable to boarding itself with all of the ship’s marines engaged elsewhere. In the Hellenistic Period, shipborne artillery such as *ballistae* made close-quarter maneuvering even more dangerous.

Triremes were not of a uniform design or construction, and they were usually better suited to different tactics depending on their construction. Athenians seem to have preferred light and fast vessels which they could use to out-maneuver opponents, to utilize the ram rather than boarding tactics. This did, however, make them less suitable for operations in confined waters, such as in the Great Harbor at Syracuse in Sicily in 413. The confines of the harbor made it virtually impossible for the Athenians to use their great mobility to attack the flanks of the enemy warships. In addition, the Syracusans modified their own ships by strengthening the bows and reinforcing the upper-works of the prow which gave them the advantage in the harbor where usually only head-on attacks were possible. In this instance, the Syracusans were better able to adapt their vessels and their tactics to overcome the Athenians, who were not as experienced in such confined waters.

As a side-note to the naval battles of the Sicilian campaign, the

Syracusans also employed an unorthodox tactic in the form of a fireship. The ship was packed with dry wood, set on fire, and allowed to drift down with the wind into the anchored lines of the Athenians with the aim of setting them alight. This unusual tactic was one often used much later during the age of sail and the great naval encounters of the seventeenth to nineteenth centuries.

Ramming was the primary means of attack for warships into the Hellenistic Period, and several different tactics were employed. Boarding of an enemy vessel did cause far less damage to the captured ship than ramming, but wooden ships do not sink easily and even one which had been the victim of ramming would often still be captured by the victors. During the battle of Salamis off Cyprus in 306, Diodorus mentions that many ships were disabled when their oars were sheared off by the maneuvers of enemy ships and could take no further part in the fighting.

One of the usual ramming tactics used by warships was the “breakthrough” maneuver, the *diekplous*. This involved the attacking ships forming into a line-ahead formation and breaking through the defending ships in line-abreast formation. This gave the attacking side the chance to attack the exposed flanks and sides of the defending ships. It was a tactic that came with great risk, for the attacking ships were left with their own flanks exposed when passing through the line of the defenders. The Greeks of Chios successfully used this tactic in the battle of Lade against the Persians in 494, though their ships also carried a large complement of marines in case the Persians were able to board.

The other common ramming tactic used by warships was “sailing around” or “encirclement,” the *periplous*. This was generally favored when one side had a measure of numerical superiority which allowed the wings of the attacking side to overlap those of the defenders. It also required fast ships, fast enough to get around the wings of the defending ships to attack from the rear, presumably while the defenders were being kept occupied by the other attacking ships to the front. The numerically inferior Greek forces at the battle of Salamis in 480 negated the risk of being outflanked in a *periplous* maneuver by fighting in the narrow channel between the island of Salamis and the mainland. This was effective, and the faster and numerically superior Persians were not in any position to encircle the Greeks. This allowed the Greeks to launch what was effectively a *diekplous*, which their slower ships were able to pull off because their crews were

much better rested than the Persian ones who had been at their oars for many hours beforehand.

Finally, warships could form up in a defensive circle formation known as a *kyklos*. At Artemisium in 480, the numerically inferior Greeks formed this defensive circle, holding the Persians at bay until just before nightfall. At a signal the Greeks all attacked outward at the Persians, who by that point were sailing around the Greek formation and had left their flanks exposed to the Greeks (see Document 5). This particular tactic, however, failed a numerically *superior* Peloponnesian fleet in 429. A group of 47 Peloponnesian ships were sailing from Corinth with their vessels loaded more as troop carriers than fighting ships. They were intercepted by the 20 Athenian vessels guarding the narrow straits leading out of the Corinthian Gulf. The Peloponnesians were surprised by the audacity of a fleet less than half their size, but they nevertheless formed a defensive circle, bows out. The Athenian commander Phormio then had his ships sail around the Peloponnesians, feigning an attack every now and again. This resulted in the Peloponnesian ships closing ranks even further, and as Phormio had known would happen, the wind came up and caused the Peloponnesian ships to fall foul of one another. The Athenians attacked in force and won a decisive victory. This example illustrates very well the need for good seamanship and good command and control, as well as the importance of understanding weather conditions.

All of these tactics, especially the *diekplous* and *periplous*, required a high standard of seamanship and discipline. At the beginning of the Second Peloponnesian War, the Athenian statesman Pericles told the Athenian population that the Spartans would not find it easy to challenge Athens at sea. In this famous passage, Pericles says that the unseamanlike Spartans will find familiarity with the sea difficult, that the Athenians themselves who had been practicing since the Persian Wars had not yet perfected the art of seamanship. Further, seamanship was a skill that required constant practice and was not a leisurely pursuit; so exacting a skill to maintain that it left no time for leisure (Thucydides 1.142). This was an accurate assessment, for the Athenians proved many times the superior training which allowed them to employ the above tactics to great success over many decades and become the most powerful navy in the Aegean.

Naval Warfare

Naval warfare played a pivotal role in conflicts during the Classical and Hellenistic Periods, both between Greek city-states and between Greeks and foreigners. The Greeks had a long and rich maritime history, from when the Minoan king Minos supposedly established a thalassocracy based on the island of Crete. Greeks colonized the entire Mediterranean basin, fought wars with Persians and others, and interminably fought each other. The rough nature of terrain throughout the region and the primitive nature of roads meant that naval forces had much greater strategic and operational mobility than land forces.

Apart from the literary record, Greek naval warfare has left behind little evidence. Yet many naval battles of the era had decisive impacts on conflicts and wars of the time, turning the tide or winning them outright. The great naval battle of Salamis in 480 helped halt the Persian advance into Greece, and in 405, it was the naval battle at Aegospotami in the Hellespont (Dardanelles) that ensured Spartan victory over Athens in the Second Peloponnesian War.

Examination of Greek naval warfare relies heavily on written sources, as few archaeological remains of ships or equipment survive and artistic depictions are more stylistic than representative. Various historians and even playwrights served on naval campaigns and described them. The historian Thucydides was a naval commander during the Second Peloponnesian War, which he later wrote about. His failure to save the strategically important city of Amphipolis in 424/3 while in command of a

naval force led to his exile. The great playwright Aeschylus almost certainly fought at the battles of Artemisium and Salamis, the latter battle being the focus of his play *The Persians*.

The main warship of the Classical Period was the trireme, which had evolved from smaller vessels known as penteconters. The trireme was a swift vessel either sailed or rowed, though always rowed during battle. The ship itself was a weapon, fitted with a large ram and primarily designed for ramming attacks against other vessels using speed and maneuverability. It also carried marines (*epibatai*) armed for close combat or with bows and missile weapons which could be used to target the crews of other vessels. Occasionally, when seamanship training was poor, a commander might prefer to employ boarding tactics using the *epibatai* rather than the more complicated and disciplined tactic of ramming.

Funerary *stele* of Democleides, son of Demetrius, Athens, ca. 400–380. Democleides probably died in one of the naval battles in the Corinthian War (395–387/6). His monument depicts the two offensive weapons of classical naval warfare—the trireme’s ram and the *epibatai* (marines) carried on board. Democleides, a marine, is shown sitting in sad contemplation on the prow of his trireme, helmet and shield beside him. Located in the National Archaeological Museum, Athens, Greece. (DeAgostini/Getty Images)

Naval battles could involve hundreds of ships and tens of thousands of men and, although generally naval battles were fought within sight of land, this could still be quite some distance and marines were weighed down by armor. Bad weather conditions, such as those after the battle of Arginusae, could prevent the rescue of sailors in the water, and storms could be deadly. For example, a key event in the Persian War of 480 was the destruction by bad weather of a Persian fleet sailing around the weather side of the island of Euboea (see Document 5). This helps highlight the dangers of sailing the Mediterranean, especially during particular times of the year. Usually the four months of winter put a halt to major operations at sea, although there is the case of a small contingent of Athenian warships sailing from mainland Greece to Sicily in the middle of winter 414/3 to reinforce the desperate Athenian forces there. Winter was an impediment to sailing, but pressing military imperatives could override the Greek aversion to sailing at dangerous times of the year.

Because of the restricted carrying capacity of warships, fleets often put into a port or landed ashore at night to eat and rest. Fleets could and would sail across the open ocean if needed, or they might sail along the coast depending on the circumstances. Likewise, ships and fleets would sail overnight if required. In fact, there are numerous examples of generals and admirals waiting until nightfall to commence an attack or a landing of troops with their ships. A clever ploy in 415 allowed the Athenians to sail their ships full of troops down the coast of Sicily by night and land on the shores of the Great Harbor at Syracuse, surprising the defenders there (Thucydides 6.64–65).

The operations which Greek naval forces undertook ranged across a wide spectrum, including both combat and noncombat operations. Naval operations are now commonly divided into three different major roles containing subordinate tasks: Military, Diplomatic, and Constabulary. These are modern terms used to categorize modern naval operations; nevertheless, Greek naval forces can clearly be seen undertaking all three roles in the Classical and Hellenistic Periods.

As is true of all navies throughout history, the core job of Greek naval forces was to fight and to win at sea. Battle between fleets was a key feature of the Greek wars with Persia from 480 to 449, as well as during the Second Peloponnesian War and the wars of the fourth century. As already noted, several of these battles had a critically defining impact on the war in which

they were fought. These battles could involve anywhere from 40 through to over 400 ships, rivaling battles fought on land in numbers of combatants involved. The battle of Sybota in 433 involved 270 ships in total, which means there would have been between 40,000 and 55,000 combatants present, depending on the sizes of the respective crews. Such a large number of rowers and combat troops required a significant investment in training, as well as in money. Rowers were not slaves and were paid, and the larger the fleet and the longer it spent away, the more financially costly was the campaign.

Because ships were very capital- and human resource-intensive, battle was often seen as a way in which to bring about the outright defeat of an enemy. The Persian forces which invaded Greece in 480 aimed at destroying the Greek naval forces so they might have control of the sea. This would have allowed the Persians to land troops in the Peloponnese, thus bypassing the Greek attempt to defend the narrow Corinthian isthmus. After the small Spartan army was annihilated at Thermopylae, the Greek naval forces which had been successful at Artemisium were forced to fall back. Gathering at the island of Salamis off the coast of Attica, the Greeks finally resolved to hold their position and fight the Persians. When the Persian forces were defeated, they retreated back to Asia and the army left behind was defeated the year after by the combined Greek forces at the battle of Plataea. Without victory at Salamis, the Peloponnese would have been left wide open to attack from the sea by Persian naval forces. The battle of Plataea may have expelled the Persians from Greece, but without victory at sea off the coast of Salamis there would have been no Plataea.

Fifty years after the battle of Salamis the Corinthians tried to convince the Spartan assembly that one large-scale victory at sea over the Athenians would break their power. Though it took longer than envisaged, the Athenians were eventually defeated when their navy was completely destroyed by the Peloponnesians under Lysander in 405 at Aegospotami. The destruction of the Athenian fleet left their city exposed to blockade by sea as well as land and the Spartans were able to starve them into submission. Athens feared the same thing in 387 when a combined fleet of 80 ships from the Peloponnese and Syracuse set up near Abydos, blocking grain ships sailing from the Black Sea to Athens. Salamis (in Cyprus) was the scene of a naval battle in 306 when the fleets of Ptolemy I Soter and Antigonus I Monophthalmus, two of Alexander's Successors, met in battle.

Antigonus' force, led by his son Demetrius I Poliorcetes, was victorious and destroyed Ptolemy's naval force, opening the way for an invasion of Egypt.

Outside of battle between fleets, Greek naval forces were involved in other forms of combat operations. The interception and protection of trade was a very important task assigned to navies. This was especially true for the protection of Athenian trade. Athens was a maritime power and relied heavily on the import of food and other goods, as well as the export of high value crops such as olive oil and wine. After the loss of their fleet in Sicily in 413, the Athenians fortified and set up a fleet base at Cape Sunium at the southern tip of Attica to protect the grain ships rounding the cape. Spartan ships were sent out specifically to raid Athenian trade near Cnidus in the eastern Aegean, a threat which the Athenians took very seriously and successfully countered with their own naval force. During the Third Macedonian War, Perseus dispatched warships to the Aegean to protect grain ships bound for Macedonia.

As noted above, the Spartan victory at Aegospotami allowed Sparta to cut off the supply of grain to Athens. Prior to this, the Spartan king Agis had remarked that so long as grain ships continued to sail into the harbor of Athens, his siege of the city by land was a fruitless undertaking. Because ships could not stay at sea for extended periods of time they did not execute a blockade by staying off-shore, but by having a nearby base from which they could intercept vessels attempting to break through the blockade. Nevertheless, navies could effectively cut off land forces as the Athenians did to the Spartans trapped on the island of Sphacteria in 425, who were besieged by the blockading Athenians for 72 days. In his *Constitution of the Athenians* 2.11–12, the “Old Oligarch” (or Pseudo-Xenophon) remarked that the Athenians were able to control unruly allies by using their navy to cut off the recalcitrant city-state from seaborne trade.

Navies granted the different city-states of Greece great mobility, a capacity to bypass rough terrain, inhospitable political territory and enemy forces. The Greek force holding the pass of Thermopylae in 480 was protected from an outflanking maneuver by the attending fleet at Artemisium. In 424 the Spartan general Brasidas was forced to take a longer and rougher journey overland to northern Greece to attack the Athenian allies there, since he dared not go by a sea which the Athenians controlled. It also required skillful maneuvering to avoid marching the army through the territory of neutrals and inflaming political sensitivities, less of a

consideration when going by sea. Alexander the Great used a force of 20 Athenian triremes to swiftly carry siege equipment to help take the city Halicarnassus in 334.

Not only did a navy allow for mobility, it also allowed for the landing of troops in enemy territory to raid or cause serious damage. Persia's first invasion of Greece, by Darius in 490, resulted in an amphibious landing at Marathon, followed by a seaborne retreat. It was this invasion that convinced the Athenian statesman Themistocles to build the fleet which would protect Athens and indeed all of Greece during the following invasion in 480. Marathon was a hoplite victory and yet it still resulted in the construction of a strong navy, the Athenians realizing an army of hoplites could do little in the face of a superior naval force able to move much more quickly than a land force.

The Second Peloponnesian War fought between the Athenians and Spartans provides numerous examples of amphibious campaigns. The starkest illustration of the predominance of naval forces is the fact that the war involved only a few pitched hoplite battles, of which one (the battle of Mantinea in 418) was technically during the Peace of Nicias between the two main powers. Further, most of the war was conducted far removed from the actual cities of the main protagonists, from Sicily in the west all the way to Rhodes and the Black Sea in the east.

During the first 10 years of the war Athenian strategy centered on its sea power, used to take control of the islands outlying the Peloponnese and giving them bases from which they could launch attacks on the Spartans and their allies. These attacks ranged from small raids on territory to large attacks on cities all the way up to attempts at establishing a fortified position in the Peloponnese where the unruly Helot population of Sparta might be enticed to desert. The ultimate success of this strategy was when in 425 the Athenian navy trapped some 420 Spartan hoplites on the island of Sphacteria (see illustration in Pylos [Sphacteria], Battle of entry). So dire did the Spartans find this situation that they immediately asked for a truce. When the truce failed and the 292 survivors (including 120 Spartiates) were captured by the Athenians, a shocked Sparta asked for a full-blown peace treaty to get them back, and when this failed they refrained from their annual invasions of Attica lest the Athenians execute the prisoners.

Perhaps the greatest example of an amphibious operation in Classical Greece and indeed in all of ancient history is the Athenian expedition

against Sicily in 415–413. Thucydides says of it that it was the largest military undertaking up to that time and he goes on to detail a force of 136 warships, some utilized as transports, as well as a large supporting force of 30 supply ships and over 100 other boats. These forces operated in southern Italy and then down the entire eastern coast of Sicily, culminating in a long and bloody siege of Syracuse. Over the course of two years of operations, a constant stream of reinforcements was sent by both sides from Greece to Sicily. This entailed naval operations back in Greece. In one case, the Athenians desperately tried to prevent Peloponnesian reinforcements sailing from the Corinthian Gulf while Corinthian warships did their best to engage the Athenian warships and allow the transports full of soldiers to slip past. In this they were successful and some 700 hoplites were able to reinforce Syracuse against the Athenians. Alexander the Great did not utilize naval forces on a large scale, and his long overland march west from India helps demonstrate the folly of even an ostensibly strong land power ignoring the power and utility gained from possession of a strong navy. In the Hellenistic Period, wars often ranged across the Aegean, with troops carried across the sea from Egypt, Greece, and Cyprus.

The use of navies for constabulary tasks, especially the policing of piracy, is perhaps the oldest and the most enduring of all naval operations. Thucydides (1.4–5) says that King Minos of Crete, who he thinks was the first to establish a navy, did his best to put down the piracy which had become rife throughout the Aegean. Early in the Second Peloponnesian War the Spartans tried to recruit pirates to attack Athenian shipping since their own navy was so inferior. Down into the fourth century the historian Diodorus (16.5.3) states that pirate ships had made the entire Adriatic Coast unsafe for merchant ships, necessitating naval intervention. Warships were critical, not only in directly combating pirate vessels but also in neutralizing pirate bases of operations. At the end of the day, the causes of piracy had their roots on land, and the stability and security provided by a strong navy, as in the case of Athens and Rhodes in the Aegean, was of critical importance to the maintenance good order at sea.

Naval forces were often utilized for diplomatic purposes, especially by the Athenians to control their allies. Land forces were unavoidably intrusive, but naval forces could reach far and wide and make a statement of strength or support without any actual encroachment into territory or acts of outright aggression. The Athenian statesman Pericles sailed a force of 100

ships around the Aegean and into the Black Sea as a show of strength. He displayed to potential adversaries Athens' ability to strike anywhere along the coast while simultaneously showing the allies that Athens' navy was in control of the sea—both a threat and a sign of support to those allies. During the Second Peloponnesian War, both the Athenians and Peloponnesians often sent out warships to collect money or tribute from allies and neutral powers, with the clear message that noncooperation would lead to the intervention of warships packed with troops.

Warships could be used in more subtle ways for diplomatic purposes. Before the outbreak of the Second Peloponnesian War, Athens decided to conclude a defensive alliance with the island of Corcyra, a bitter enemy of Athens' rival Corinth. Corcyra possessed one of the most powerful navies in Greece, and that fact in itself helped persuade the Athenians it would be better to have those warships on their side than that of potential enemies. When Corinth threatened Corcyra with attack, the Athenians sent 10 ships to reinforce the island. This small contingent of warships had the dual role of providing comfort to the Corcyraeans that Athens would indeed aid them, as well as signaling to the Corinthians that Athens was resolved to uphold its defensive alliance with Corcyra despite Corinthian threats.

Athens' war with its allies (the Social War) in 357–355 had its origins in the reemergence of Athenian naval power. Justifying the need for their navy by referring to the threat of piracy, Athens became more forceful with allies and neutrals alike. Seeing this rise in Athenian power as a threat, several of its most powerful allies revolted and conducted their own maritime operations against Athens and its remaining allies. The direct military use of Athenian naval power had dire diplomatic consequences, convincing others of the threat Athens posed and leading to war.

In the third century, the Ptolemies of Hellenistic Egypt became the dominant maritime power in the Aegean. Ptolemy I built up a powerful navy in the last two decades of the fourth century, strong enough to campaign simultaneously around the Aegean. He established a strong presence in Cyprus, both allowing for a solid defense of Egypt from the north as well as allowing his forces to strike at the Phoenician coast and up into the Aegean.

Ptolemy II Philadelphus inherited both the strong navy and a strong strategic position, which allowed him to dominate affairs in the Aegean. Ptolemaic naval bases were established throughout the southern Aegean,

including on Cos, Samos, Thera, and Crete. These provided bases from which ships could strike out at enemies, protect trade and maintain a diplomatic presence.

Ptolemy II made contact with Rome as early as 273, demonstrating more than just a token interest in the western Mediterranean. The image of a Ptolemaic warship with the name *Isis* was found in the Black Sea and can be dated to the mid-third century. The Ptolemies were also very active in the Red Sea, trading from the port of Berenice and other places with ports along the coast of Africa, Arabia, and even into India. The size of the Ptolemaic navy in the Red Sea is unknown, but likely to have been large enough to protect their trade interests and military expeditions, especially from piracy, though they faced no great naval threat in the area.

Ptolemy III Euergetes was able to capitalize on a strong position in the Aegean to extend Ptolemaic influence over the coast of Syria and Cilicia at the expense of the Seleucid Empire. It was only with the rise of Rhodes as a strong naval power in the late third century that Ptolemaic Egypt lost its position as supreme sea power in the eastern Mediterranean. Even then, by the time of Octavian and Mark Antony's civil war, Ptolemaic Egypt still possessed a powerful navy which was finally defeated at the battle of Actium in 31.

Naval warfare played a crucial role in the major conflicts of the Greeks, from the Persian Wars to the wars between Alexander's Successors. Athens, Rhodes, and Ptolemaic Egypt were amongst the greatest maritime powers in the ancient world, their strength at sea allowing them to establish and maintain great cosmopolitan cities where goods and ideas were exchanged around the Mediterranean and the Indian Ocean.

Naxos, Battle of (376)

The Athenians' first unaided naval victory since the end of the Peloponnesian War (431–404), the battle of Naxos, fought during Athens' war with Sparta 376–374, reestablished Athens as a major maritime power. The Spartan fleet consisted of 60 to 65 triremes, under the command of Pollis; Athens sent a fleet of possibly 83 triremes, under the command of Chabrias, to lay siege to Naxos, a Spartan ally. Pollis responded by bringing the entire Spartan fleet into the bay of Naxos and, commanding the right wing himself, successfully engaged the Athenian left where he killed Cedon, an Athenian commander, sank some ships and forced the rest into flight. Seeing the distress on his left wing, Chabrias sent reinforcements to the left and was himself able to break the Spartans and rout the majority of their ships, capturing 8 and destroying 24. Athenian losses totaled 18 ships. Mindful of the precedent of Arginusae, Chabrias refrained from pursuing and destroying the Spartan fleet, concentrating instead on recovering Athenian survivors and dead from the water.

Naxos, Naxians

Naxos is the largest island of the Aegean Sea, and belongs to the group of the Cycladic islands. During the sixth century, Peisistratus, the Athenian tyrant, attacked Naxos and installed the tyrant Lygdamis on the island. By 528, the Spartans had overthrown the tyranny at Naxos and many exiled oligarchs returned back to the island. In 500/499, the island was attacked by Aristagoras, the Milesian tyrant who in the name of the Persian Empire tried to conquer the island. Herodotus mentions that the island was attacked because exiled Naxian aristocrats appealed to Aristagoras for help in order to return to the island. He also suggests that the failure of the attack led in part to the Ionian Revolt of 499–493. During the last years of the Persian Wars, the Naxians tried to expel the Persians from the island. However, the island did not manage to restore its former military power.

The island joined the Delian League in 477. Around 468/7, the Naxians tried unsuccessfully to revolt from the League. As a result, the Athenians enslaved the Naxians—Naxos was the first member of the League to be subjugated in this way. After the enslavement, Naxos lost its autonomy and this could in practice involve the following: the demolition of its fortifications, the establishment of an Athenian military garrison on the island, the confiscation of its fleet, and the payment of a monetary tribute to Athens. By the 450s, Athenian cleruchs were established on the island of Naxos. The behavior of the Athenians toward the Naxians revealed their oppressive nature and imperialistic intentions.

Naxos gained its freedom with the Athenian defeat in the Second Peloponnesian War (431–404) and in 376 an Athenian attack on it drew off the Peloponnesian fleet blockading the Piraeus. The 83-strong Athenian fleet under Chabrias defeated the 65-strong Spartan fleet under Pollis—largely because of the initiative of Phocion. This was the first truly Athenian naval success since the end of the Peloponnesian War and led to a surge of states joining the Second Athenian Confederacy. Naxos, too, joined the Confederacy but subsequently attempted to revolt—again unsuccessfully.

Nearchus (d. ca. 312)

Nearchus, son of Androtimus, was born on Crete but his family later settled in Amphipolis. Although probably older than Alexander the Great, at some point Nearchus became one of his companions. In 337, during the family discord over Philip's impending marriage, Philip II exiled Nearchus, Harpalus, Ptolemy, Erigylius, and Laomedon. The exiles were recalled on Philip's death and Nearchus was rewarded with the satrapy of Lycia early in Alexander's conquest of Persia (334/3).

Nearchus reappeared in the historical accounts in 328, arriving in Bactria with reinforcements for Alexander's invasion of India. His main claim to fame is as the admiral in charge of the fleet Alexander dispatched to establish the route from the Indus River to Persia. Nearchus' description of this was used by Arrian. Based on Arrian's record of detailed distances for each stage of the voyage, it seems Nearchus took careful notes. Later geographers, such as Strabo also used Nearchus' work. When Alexander died (323), Nearchus supported the unpopular claim of Alexander's son by Barsine. He later served Antigonos I (Monophthalmus) and Demetrius I (Poliorcetes) and was probably killed at Gaza in 312.

Nemea, Battle of (394)

A decisive Spartan land victory over the allied states of Argos, Athens, Corinth, and Boeotia (Thebes) during the Corinthian War of 395–387/6. The Spartans marched along the coast of the Gulf of Corinth under the command of the boy-king Agesipolis’ guardian, Aristodemus. The Spartan army was composed of 6,000 Spartan hoplites; 7,500 hoplites from Elis, Triphylia, Acroreia, Lasion, Sicyon, Epidaurus, Troezen, Hermione, and Halieis; 600 Spartan horse; 300 Cretan archers; and 400 Marganeis slingers. There were also an undisclosed number of hoplites from Tegea and Mantinea, probably bringing the total to more than 15,000 soldiers. Of the 24,000 hoplites on the allied side, there were 6,000 Athenians, 7,000 Argives, 5,000 Boeotians, 3,000 Corinthians, and 3,000 Euboeans. There were also substantial cavalry regiments brought by the Boeotians (800), Athenians (600), Chalcidians of Euboea (100), and Opuntian Locrians (50).

The two armies met on opposite sides of the Nemea River, a dried up river bed to the southwest of Corinth. The battle commenced with each side heavily favoring their right flank, the Boeotian-led allies winning a victory over the Spartan allies, and the Spartans winning a victory over the Athenians stationed on the left of their line. With the battle hanging in the balance, the Spartans seized an opportunity to turn the allied wing. Finding that the allies were in too deep a formation to allow this, the Spartans collided with the Argives, Corinthians, and Boeotians as they attempted to return from their pursuit. The Spartans routed their enemy, collecting 2,800 casualties from the Boeotian led alliance, while only suffering 1,100

casualties of their own, most coming from their own allies.

Neodamodeis

Neodamodeis are first attested as part of the Spartan army in 421 (Thucydides 5.34). They were ex-Helots who had been freed to serve as hoplites. In contrast to the Helots who had served with Brasidas, and who were freed only on their return to Sparta, *Neodamodeis* were freed before they served. Their precise social status is uncertain. Their title apparently referred to their new (*neo-*) standing and to their connection with the citizen body (*damos*), but they were not equal to Spartiates in power and privileges.

Neodamodeis were used on prolonged campaigns outside the Peloponnese, such as those in Sicily in 413 (Thucydides 7.19) and in Asia Minor in 399–94 (Xenophon, *Hellenica* 3.1.4, 4.2). They are last attested in 370/69 as a garrison at a key point on the Spartan frontier before the Boeotian invasion (Xenophon, *Hellenica* 6.5.24). After this Sparta hardly needed troops for prolonged campaigns outside the Peloponnese and in any case *Neodamodeis* disappear from historical sources after 370/69.

Nicias (ca. 470–413)

Nicias, son of Niceratus, was a moderate Athenian politician and general (*strategos*) during the Peloponnesian War (431–404). He was reelected *strategos* each year between Pericles' death (429) and his own (415). Thucydides, who probably knew Nicias personally, provides a generally favorable portrait of a man of some ability brought down by bad luck and an overly cautious nature. He comments on Nicias' capture and execution at the end of the Athenian expedition to Sicily that he "... of all the Greeks in my time, least deserved such a miserable death as his entire life was devoted to studying and practicing *arête* (virtue)" (Thucydides 7.86.5.)

Nicias was a very wealthy man, famously owning 1,000 slaves he leased out as miners. Following Pericles' death, Nicias was the voice of caution against the advocates of a more aggressive strategy. His main opponents were Cleon (first opposing him over Pylos/Sphacteria) and then Alcibiades. Nicias enjoyed a few years of political dominance between the signing of the Peace of Nicias (421) following Cleon's death and Alcibiades' first venture—support for the anti-Spartan movement in the Peloponnese which culminated in the battle of Mantinea (418).

Alcibiades' attempt to undermine Sparta in the Peloponnese was really formal recognition that the Peace of Nicias between Athens and Sparta had effectively failed. Thucydides (5.16) notes that Nicias had a personal as well as a policy motive for peace—he wanted a trouble free life and to avoid risking his good war record and reputation in further operations. If true, it suggests that Nicias was no longer really interested in shouldering the burden of command, or perhaps believed he was no longer really up to it.

This is certainly consistent with Nicias' remaining career and especially his opposition to the Athenian expedition to Sicily in 415. When it became clear the expedition would occur, Nicias tried to dissuade the Athenians by insisting on a huge force. When the assembly voted the forces he had recommended he had little choice but to accept command, along with Alcibiades and Lamachus.

On arrival, Nicias made a final attempt to avoid combat, arguing that they should sail home after a show of force. This was rejected by his fellow

generals. With Alcibiades' recall and Lamachus' death, Nicias became the senior commander in Sicily and had the misfortune of presiding over the military disaster he had feared and had worked so hard to avoid. His caution, which if heeded in 415 would have prevented the expedition in the first place, now worked against him. When decisive action was required to withdraw, Nicias delayed, according to Thucydides through a mixture of illness, excessive religious observance, and a fear of what would happen if he returned home unsuccessful. The result was the complete destruction of the expeditionary force and Nicias' capture and death (413).

Nicias' career was characterized by moderation. He was a solid commander but ultimately unable to cope with the complexities and strains of managing a major war in the context of the volatile Athenian democracy.

Notium, Battle of (406)

Notium, the harbor of Colophon, situated west of Ephesus was the site of a Peloponnesian naval victory over the Athenians during the Second Peloponnesian War (431–404). Militarily unimportant, it ended Alcibiades' checkered career as a general.

The two main accounts, Xenophon and Diodorus Siculus and his apparent source, the *Hellenica Oxyrhynchia*, differ in detail—perhaps

because the latter's information derives from Athens and Xenophon's from Sparta. Alcibiades had originally sailed with 100 ships but as Xenophon later records that Alcibiades' fleet significantly outnumbered Lysander, who had 90 ships, he must have received local reinforcements prior to the battle (Xenophon, *Hellenica* 1.4.20, 5, 15). While visiting Thrasybulus, the Athenian commander in the Hellespont (Dardanelles), Alcibiades left his helmsman, Antiochus, in command with strict instructions not to engage the Peloponnesian fleet under Lysander at nearby Ephesus. Antiochus, however, chose to take 10 (or perhaps two) triremes and sail past Lysander's fleet, laughing at them. Lysander sent ships in pursuit, sank Antiochus' ship, and then launched a general attack in good order. The main Athenian fleet, clearly unprepared, entered the engagement piecemeal and lost either 15 or 22 ships. Although most of these crews escaped, the result was embarrassing and Alcibiades' enemies ensured he was blamed on the valid grounds Antiochus was unsuitable to lead. Alcibiades, stripped of his command and replaced by Conon, went into exile (for the final time).

O

Oenophyta, Battle of (457)

The battle of Oenophyta is an obscure but major Athenian victory over a Boeotian League force led by Thebes in autumn 475. Diodorus Siculus' details of Athenian preparations before a victory by Myronides in Boeotia may well refer to Oenophyta. Although he treats this as a separate engagement, Diodorus seems to have created two battles from one. Other than that, no details of the preparation or fighting are preserved in the extant sources.

However, it is clear that Oenophyta reversed the result of Tanagra, significantly extended Athenian power to its north, and made Myronides' reputation as a general. Shortly after the major Athenian defeat at Tanagra, Myronides led the Athenians back into Boeotia. At Oenophyta in southeast Boeotia, although apparently outnumbered, he decisively defeated the Boeotian League army. Athens reasserted control over all of Boeotia except for Thebes. Myronides followed up by subduing Locris and forcing Phocis to ally with Athens, but returned home after failing to overawe the Thessalians.

Olpae, Battle of (426)

Olpae was a stronghold near Amphilocheian Argos. In 426, it was the site of a battle fought between Athens and their Acarnanian allies and the Peloponnesians and their Ambraciot allies during the Second Peloponnesian War (431–404). The Athenian *strategos* (general) Demosthenes defeated the Ambraciots and Peloponnesians under Eurylochus, rehabilitating his reputation after his earlier defeat in Aetolia. Demosthenes commanded an Acarnanian and Athenian army that had combined to retake Olpae. Outnumbered, Demosthenes placed a contingent of hoplites and light troops in ambush on his left wing. Their attack on the rear of the enemy right wing caused a rout.

Demosthenes negotiated a secret agreement allowing the Peloponnesian survivors to withdraw if they abandoned their Ambraciot allies. At dawn the next day, Demosthenes attacked and destroyed a second Ambraciot army coming to help those at Olpae. The reported Ambraciot casualties were so huge that Thucydides refused to record them because he found them incredible. Despite this, and the success of Demosthenes' deal with the Peloponnesians in discrediting them as allies in the region, the subsequent peace between the Ambraciots and Acarnanians did little to extend Athenian influence in the area.

Olympia

Olympia, in Elis in the western Peloponnese, was an important panhellenic center and the most important sanctuary of Zeus. Just as Delos was a particularly significant sanctuary for Ionian Greeks, so Olympia was

important to Dorians. Its temples and shrines drew a steady flow of religious pilgrims. Its quadrennial athletics festival, the Olympia, was the first of the four *agōnes* (contests, sing. *agōn*) officially recognized as part of the *periodos* (schedule of festivals), the others being the games at Delphi, Nemea, and the Isthmus.

The Olympia with its associated games were traditionally founded in 776; lists of victors were maintained until 217 CE. Participation in the Olympic Games was open to all free Greek men. Victors included generals, shepherds, nobles, and philosophers. Unmarried women could watch, but women could not compete. A separate *agōn* for women, the Heraea, was held before the men's games.

Victors in the *agōnes* were not just considered to be skilled athletes, but men of *arête* (virtue). The only material prize, for which athletes competed, was an olive wreath. Welcoming the athletes before they entered the stadium was a line of statues dedicated to famous victors, but funded through the fines of those who had cheated. As suggested in Pindar's *epinikia*—poems written to celebrate the victors—winning delivered great fame in the mortal world and demonstrated divine favor.

As at Delphi and Delos, Olympia housed sacred treasures dedicated by many of the leading *poleis*. Excavations have unearthed many dedications of *tropaia* (trophies of arms taken in battle), including examples from the Persian Wars, notably a fine bronze helmet inscribed with the name of Miltiades, victor of Marathon.

In 432, the Corinthians tried to borrow Olympian and Delphian sacred funds to fight Athens, although the proposal was not carried through. In the fourth century, Elis and Arcadia fought over control of the sanctuary. Olympia remained a wealthy and important sanctuary in Hellenistic and Roman times, though as the Greek world declined, so did the fortunes of the sanctuary.

Olympias (ca. 373–316)

Olympias was the daughter of a Molossian king, whose family claimed to be descended from the legendary Achilles. She married Philip II in 357, with whom she had two children; the famous Alexander the Great, and a daughter, Cleopatra.

Olympias was a devoted worshipper of Dionysus, and the subject of great negativity in the ancient sources, where she appears as a vengeful, spiteful woman. Although anecdotes of her poisoning and roasting her rivals alive are likely to have been greatly exaggerated and the consequence of hostile sources, Olympias certainly showed she was highly capable and ruthless when she entered the political struggles of Alexander's Successors. She fought to secure the Macedonian throne for her grandson Alexander IV, and was responsible for numerous deaths including those of the royal couple Philip III Arrhidaeus and his wife Adea Eurydice. Olympias was forced to surrender to her political enemy Cassander following a disastrous siege at Pydna in 316. An assembly voted for her execution, and she met her death bravely at the hands of her victims' families.

Olympic Truce (*Ekecheiria*)

The Olympic *ekecheiria* was a truce associated with the Olympic Games, held every four years at the sanctuary of Zeus Olympios in Eleia.

The traditional view is that the announcement of the *ekecheiria* by envoys from Elis led to several months of peace throughout Greece. Lämmer argues, however, that since *ekecheiriai* were also declared for the other three major panhellenic festivals, all held in summer (when most Greek warfare took place), the truce must merely have guaranteed safe passage for festival-goers. In 420, nevertheless, although no visitors to the games seem involved, the Eleians fined the Spartans for attacking their own territory after the *ekecheiria* had been announced there.

Aristotle, citing an inscribed disc at Olympia, reported that the Eleian king Iphitus and the Spartan reformer Lycurgus had established the *ekecheiria*, and Pausanias says the truce was inscribed on the disc. The earliest mention of the *ekecheiria*, however, is found in Thucydides, and the disc may be a Classical creation.

Olynthus

Olynthus, an important city in the Chalcidice and capital of the Chalcidian Confederacy is located about 2.5 kilometers (1.5 miles) inland, at the head of the Gulf of Torone, between the peninsulas of Pallene and Sithonia. The site has been extensively excavated and provides a large part of our knowledge of Greek housing.

Originally a Neolithic settlement, Olynthus was resettled by Greeks in the seventh century. However, when the Persian Artabazus captured it in

winter 480/79 Olynthus was inhabited by the Bottiaeans—he handed over the settlement to local Greeks. The city was fairly insignificant until 432, when parts of the Chalcidice revolted from Athens and the Macedonian king, Perdiccas II, persuaded the inhabitants of several nearby coastal towns to move to the safer site of Olynthus. The city expanded considerably and sometime prior to 382 became the capital of the Chalcidian Confederacy.

In that year, Amyntas II of Macedon and two Chalcidian towns—Acanthus and Apollonia—complained to Sparta that Olynthus was expanding into Macedon and forcing cities into the Chalcidian Confederacy. The Spartans dispatched an expeditionary force from the Peloponnesian League. In 381, when the Spartan commander Teleutias was killed, Sparta sent out reinforcements under King Agesipolis I. Although he died of illness, the Olynthians were forced to make peace and the Confederacy disbanded.

However, this may have been very temporary as “the Chalcidians” appear as a group in the new Second Athenian Confederacy, founded in 378/7. Twenty years later, Olynthus had regained its full power and position at the head of the Chalcidian Confederacy. For the next 10 years or so, it preserved its independence by alternately allying with Athens and Macedon. The final alliance, with Athens, failed to save the city. Having forcibly detached the rest of the Confederacy from Olynthus, in 348 Philip II seized it after a short siege, through the treachery of two prominent citizens, Lasthenes and Euthyrates. He destroyed the town (ironically preserving it for the extensive archaeological digs in the twentieth century) and sold the inhabitants as slaves. Although a small part of the city’s northern area seems to have been reoccupied, it was a mere shadow of its former self. The last inhabitants were moved to the site of Cassandreia in 316.

Omens and Portents

The interpretation of omens and portents was not a simple science. Even the religiously conservative Herodotus questioned whether it was the Magi's sacrifices to Thetis which stopped a damaging storm at Sepias, prior to Artemesium, or whether the storm had "naturally abated" (Herodotus 7.191). But more often than not, Herodotus and other commentators were willing to accept that signs from the physical world were indications of divine will. For example, Thucydides reports that it was retrospectively explained and widely accepted that the devastating earthquake at Delos had been a portent of the miseries to beset Athens in the Peloponnesian War (431-404). Even spiders spinning black webs were interpreted by Pausanias as an omen of the destruction of Thebes by Alexander the Great.

The closed society of the Spartans may have made them more conservative in religious matters than most other Greeks. While their tardiness at Marathon has been criticized as being more political than a genuine religious qualm over the progress of the full moon, it is not an isolated example. The Spartans made few exceptions in religious practices. The Argive democrats, who knew the Laconian mind better than most, banked on its piety by timing a coup to coincide with the festival of the *Gymnopaediae* in the hope of discouraging Spartan interference.

Before most battles, the seers who generally accompanied the armies would closely examine the sacrifice for signs of what would come. Whether the animal was blemished, or balked at the altar, how the flames behaved, and the way that the fat and entrails burned were all studied carefully. The seers would then say whether these omens were favorable or not, and only then would an army willingly march against its foe.

When the gods did not visibly support one side over the other or offer a clear sign, it was still possible for a commander to claim that the gods were on side. All that needed to be done was to espouse the righteousness of the

cause. Natural phenomena could also be used to lend weight to *either* side of the argument. For example, Thrasybulus interpreted a sudden snowstorm at Munychia as direct evidence of divine approval, while a solar eclipse deterred Cleombrotus from attacking the Persians after Salamis. Examples in which omens were ignored, but a victory was achieved nevertheless, are hard to find. Pelopidas deliberately ignored an eclipse and the advice of his seers against entering into battle, yet his army won. But Pelopidas, who lost his life in this battle, may have been the lonely exception to prove this rule.

There was a corpus of *chresmoi* (prophetic verses) and *logia* (oracular fragments), which were also used for advice in times of war or disruption. Thucydides notes how these proliferated before the outbreak of the Peloponnesian War. These verses tended to be more a resource for the general population in times of anxiety rather than part of any authorized divinatory process. Not all citizens relied on these prophecies. The verses of Bacis and the gullibility of those interpreting them are parodied in Aristophanes' *Knights* (121–124).

The most reputable sources of advice from the gods, of course, were the major cults and sanctuaries. There were clear political advantages to be gained from the control or influence of these sites. Themistocles' successful restoration of the sanctuary of the Lycomidae at Phlya and his attempt to create a cult of Artemis Aristoboule in public celebration of his role in the victory of Salamis, may serve as two examples.

But even the most renowned religious center of the Greek world, Delphi, could err. It famously predicted that Xerxes' army would defeat the Greeks. In supplementary advice it changed its position to say that a "wooden wall" would save Athens from the Persians. Of course, oracles can be interpreted in many ways. In this case, the general view was that the Pythia (the priestess who delivered the oracle) meant a wooden barricade on the Acropolis, but Themistocles "correctly" argued that the wooden walls were ships of the Athenians (Herodotus 7.140–143, 8.51–2). Irrespective of the interpretation, omens and portents were taken very seriously by the ancient Greeks and could affect the morale of the troops and the strategy of the generals.

Onesander (Active Mid-First Century CE)

Onesander was a Platonic philosopher who wrote a commentary (now lost) on Plato’s *Republic* and a military treatise called *Strategikos* (*On Generalship* or *The General*) which is still extant. The latter named work was dedicated to Quintus Veranius Nepos, who was the Roman governor of Britain in 57 CE and who died while in office, thereby dating Onesander’s treatise to the mid-first century CE. It is an important and comprehensive work on the duties of a general.

Onomarchus (d. 352)

Onomarchus was a Phocian aristocrat and general, who was the supreme Phocian commander for a period from 354 to 352 during the Third Sacred War (356–346). He was one of the Phocians fined by the Delphic

Amphictyony for tilling sacred land, charges which had been the trigger for the war, and commanded forces alongside Philomelus, the initial Phocian commander. After Philomelus' death at the battle of Neon in 354, Onomarchus gathered together the defeated Phocian forces, and became the leading proponent for continuing the war, and indeed doing so more ruthlessly than ever. He either began or accelerated the looting of Delphic treasures to pay for mercenaries, and Phocis reached the height of its power, with forces of over 20,000 men, under his leadership. He also killed and confiscated the property of many of his enemies within Phocis.

With his enlarged forces, he prosecuted the war energetically, attacking the neighboring eastern and western Locrians and making several incursions into Boeotia. By allying himself with Lycophron and Peitholaus, the tyrants of Pherae, he opened up a new front in Thessaly. A probably apocryphal story claims that, when he was defending the Phocian town of Elatea against a Boeotian attack, he lined up the women, children, and elderly outside the walls but behind his army, to demonstrate to the enemy the desperation with which they would fight. Probably in 353, Onomarchus invaded Thessaly to help his Pheraean allies against their enemies in Thessaly, and also against Philip II of Macedon. Onomarchus defeated Philip twice, on one occasion inviting the Macedonian forces to pursue his retreating men into a crescent-shaped valley, only to attack them from the ridges on the flanks. Philip withdrew, "like a ram," he said, "to attack all the more violently" (Polyaenus, *Stratagems* 2.38). The two generals met again the next year (353/2) at the battle of Crocus Field, near the Gulf of Pagasae. This time Philip won a comprehensive victory and Onomarchus was killed. He was succeeded in command by his brother, Phayllus.

Orchomenus (Boeotia)

Orchomenus was a city in Boeotia in central Greece. The site was one of the many excavated by Heinrich Schliemann. Its foundational myth involved an eponymous King Minyas who gave his name to the region and the people (the Minyans), already attested to in Homer's Catalogue of Ships. During the Middle and Late Helladic Periods, the city was prosperous and produced a unique style of pottery known as Grey Minyan Ware, and it was a significant city during the Mycenaean Period, giving rise to a number of epic and mythical traditions.

Orchomenus was one of the first Boeotian cities to begin minting its own coinage in the mid-sixth century. It was a prominent rival to Thebes, and stubbornly refused to join the Boeotian League. It gradually but steadily declined throughout the fifth century, which seems to have stemmed from the flooding of the fertile Copai's plain to form Lake Copai's. Orchomenus sided with the Spartans against Thebes in both the battle of Haliartus in 395 and the battle of Coronea in 394. Eventually Orchomenus was destroyed by the Thebans in 364, and then again in 346. It was rebuilt by Philip II of Macedon in 338 and continued to prosper during the third and second centuries before being completely destroyed by Sulla in 86 during his war against Mithridates VI Eupator.

Ostracism (Ostrakismos)

Ostracism represents an interesting formal or institutional attempt to

prevent civil conflict. The practice (or something very similar) is attested at Argos, Megara, Miletus, and Syracuse; however, our best evidence is for fifth-century Athens. The premise behind it was to defuse internal conflict and prevent it from escalating into full-blown *stasis* or civil strife involving violence by temporarily removing a key participant in the conflict. It may also have been in part designed to avoid the sort of situation later described by Aristides where he lamented that he and Themistocles were so bitterly opposed that they even opposed each other's good measures.

At Athens, this was done by a two-stage vote of all the citizens. Every year a vote was taken in the Athenian *ecclesia* (assembly) to decide whether the political climate was sufficiently strained to warrant an ostracism. If a majority voted for an ostracism, this was done by a second vote taken soon afterwards. The voting took place in the Agora, under the supervision of the archons, by voters nominating the individual they most wanted removed from Athens. The votes were scratched on a very common resource in ancient Greece—old bits of broken pottery, called *ostraka* (sing. *ostrakon*). Hundreds of *ostraka* have been found with an individual's name and his father's name and/or deme—sufficient to identify him precisely, and occasionally a comment like “let him leave!”

The quorum for the vote was 6,000 and it is generally accepted that if this number of votes had been cast, then the individual named on most *ostraka* was exiled. However, there is a minority view that an individual had to have 6,000 votes cast against them to be ostracized. This is based on a fragment of Philochorus (F30) who wrote in the late fourth/early third century, some time after ostracism had fallen into disuse.

The man who received the most votes had to leave Athens within 10 days and was exiled for 10 years. He was not fined, did not lose his citizenship or property, and when the 10 years was up simply returned to his normal place in society. The idea was that 10 years would ensure the individual lost his influence and contacts, and the conflict which had caused the decision to hold an ostracism would have passed. Occasionally, a state emergency resulted in an individual being recalled early. Aristides was ostracized in 482 but recalled to help repel the Persian invasion of 480. Cimon was ostracized in 461 but recalled sometime after the disaster in Egypt (454) to negotiate the Five Years' Peace with Sparta.

The date ostracism was established in Athens is also the subject of debate. It was traditionally assigned to Cleisthenes' reforms (508/7) but the

first known ostracism (a Peisistratid called Hipparchus) was not until 487—part of a sequence which also saw Megacles, an Alcmaeonid and apparently other Alcmaeonids exiled from 487–485, probably because of fears they were pro-Persian. The gap between the alleged institution in 508/7 and first ostracism in 487 suggests that ostracism was instituted a few years after Cleisthenes, and later incorrectly linked with his major reforms. Attaching reforms to known and famous reformers is not uncommon in ancient Greece—apart from Cleisthenes this also seems to have occurred with Solon and Lycurgus. However, it is equally possible Cleisthenes introduced ostracism to target his opponent, Isagoras, whose failed attempt to seize power with Spartan help led to his exile without the need to hold an ostracism.

Although ostracism remained part of the Athenian legal system in the fourth century, it fell into disuse in the late fifth century. It had deficiencies, including issues with literacy levels. Aristides is famously supposed to been asked by an illiterate fellow-citizen to write “Aristides” on his *ostrakon*. When Aristides asked him why, the man replied that he was just sick of hearing everybody refer to Aristides as “the Just” (Plutarch, *Aristides* 7). In addition, any practice designed to curb individuals can be subverted and in the case of ostracism, there is early evidence of attempts to influence or manipulate the process. For example, a batch of 190 *ostraka* with Themistocles’ name on it was found that had clearly been produced by a small number of people with the clear intention of handing them out to others. The final straw came in 417, with the ostracism of Hyperbolus—a relatively minor player in Athenian politics at the time. He was ostracized because the two main politicians, Nicias and Alcibiades, organized their supporters to vote for Hyperbolus, to ensure neither of them was exiled.

A fifth-century Athenian *ostrakon*, naming the prominent politician Themistocles. Themistocles survived several ostracisms until ca. 471, when he was voted into exile. Located in the Agora Museum, Athens, Greece. (Gianni Dagli Orti/Corbis)

Othismos

From the Greek word “to push,” the *othismos* is a phase of hoplite combat where one side pushes against the other. The true nature of the *othismos* has been long debated. The “literal model” proposes that all hoplite warfare involved both sides clashing “shield against shield” and physically pushing each other—in something akin to a rugby scrum—as in the battles of Delium in 424 (Thucydides 4.96) and in the last phase of the battle of Coronea in 394 (Xenophon, *Hellenica* 4.3.19). The “figurative model” proposes that the “push” was more metaphorical—a description of one side forcing the other back—such as occurred at the “Tearless Battle” between Sparta and Argos in 368 (Xenophon, *Hellenica* 7.1.31) or at the opening of Coronea (394) where much of the fighting was conducted “at spear length” (Xenophon, *Hellenica* 4.3.17). It seems that whether a hoplite battle developed into a literal or figurative pushing match was dependent upon the circumstances of the individual engagement.

P

Pangaeum, Mount

Mount Pangaeum is an isolated mountain chain, over 6,000 feet (1,828 meters) high, 15 miles (24 kilometers) long, and 10 (16 kilometers) wide, lying north of the Aegean in eastern Macedonia, just east of the Strymon valley. It was important in antiquity as a rich source of gold and silver. The area was mined by local Thracians as early as the seventh century, but by the sixth century outsiders, possibly Thasians and certainly Athenians, were also exploiting the area. One of the chief sources of wealth for the Athenian tyrant Peisistratus was mining interests at Pangaeum, and there are archaeological remains of sixth-century Athenian settlements on the nearby coast. In the fifth century, Athenians such as Cimon and the historian Thucydides had private interests in Thracian mines, probably around Pangaeum.

There were also larger, public attempts to exploit the area's resources. In around 512, Histiaeus, tyrant of Miletus, was allowed by the Persians to found a colony at Myrcinus in the Strymon valley, most likely in order to exploit the mines and timber in the area. In 465 the Athenians attempted to colonize Ennea Hodoi ("Nine Ways") on the lower Strymon with 10,000 settlers, but met with disaster when they tried to push further inland. The Athenians returned more successfully in 437/6, and founded Amphipolis nearby. They only held the city until Brasidas captured it in 424, but spent much of the following 70 years trying to recover it, no doubt driven by the wealth of the area. In about 370, the Thasians colonized Crenides, east of Pangaeum, and this became the main mining center. But in 357 Philip II of Macedon took control of the whole area, renamed Crenides "Philippi," and exploited the mines vigorously. According to Diodorus, they gave him an

annual revenue of more than 1,000 talents. The mines continued in use in Hellenistic and Roman times. Since 2012 there has been some limited archaeological exploration of the ancient mines.

Panhellenism

To understand the concept of panhellenism, we must first understand the fierce independence of the Greek city-states. The concept of a single Hellenic identity may have been strong, with a common language, pantheon and culture, but there was no sense of a common "nation." Greeks certainly considered outsiders as barbarians. The word itself (in Greek, *barbaroi*) mimics the "bar-bar" thought to be spoken by foreigners. There were also persistent internal ethnic divisions, primarily between the Ionians (mainly, Athens and its allies) and the Dorians (mainly, Sparta and its allies). This is not to say that the Greeks did not consider themselves "Greek," just that there was no compelling urge to form a single panhellenic polity.

Religion could serve as a common focus for Greeks. The four great Panhellenic Games, all part of religious festivals, at Olympia, Delphi, Nemea, and the Isthmus, formed a *periodos* (circuit) in which citizens of many states competed. Other sanctuaries which attracted visitors from all over the Greek world included the Argive Heraion, Didyma, the Artemision at Ephesus, the Heraion at Samos, and the Kabeirion on Samothrace. Athens promoted its own Panathenaea, the mysteries at Eleusis, and the importance of Delos as a pan-Ionian site.

In the face of a common enemy, some (but not all) Greek states might combine successfully, often under Spartan leadership. The Persians were their “natural” foe. Of the leading *poleis*, only Thebes went over to the Persians in 480 and suffered the stain of having “medized” for years afterward. The generals at Plataea seem to have sworn a common oath to enforce a joint resolve against the Persians. Explaining their refusal of terms offered by the Persian general Mardonius, the Athenians cited the need to avenge the desecration of panhellenic temples, and their duty to defend a common Hellenic identity bound by blood, language, religion, and culture. But the mainland and island Greek states were ambivalent about aiding the Greeks of Asia Minor, though in the fourth century the need to defend panhellenic identity against barbarians in the east or west was the subject of popular speeches.

States might come together in a *sympoliteia*, with a merged citizenship, as occurred with the Achaean, Boeotian, and Aetolian Leagues, the Chalcidian Confederacy, or the alliance of Corinth and Argos in the Corinthian War. But the Peace of Antalcidas (otherwise known as “the King’s Peace”), which ended the latter conflict, did much more to unite the Greeks, albeit through force. Spartan hegemony was propped up through Persian gold purchased, in turn, by the abandonment of Ionia and Cyprus to Artaxerxes II. There were further Common Peace agreements, but the rise of Philip II of Macedon and his son Alexander, saw the first really effective panhellenic federalism in the 330s. It is ironic that it took the sheer force of the men of Macedon, the former fringe-dwellers of the Classical world and those considered by the traditional powers to be “the least Greek,” to unite the old *poleis*.

Paraetacene, Battle of (316)

Antigonus I Monophthalmus and Eumenes of Cardia are regarded as the two best generals of the Successors and fought a series of battles against each other in Asia Minor. Paraetacene and Gabiene were the last of these engagements. Both should be noted as the first pitched battles in the Hellenistic Period that saw a large number of elephants fight on both sides.

From the left, Eumenes drew up light cavalry fronted by elephants and light infantry, the veteran *sarissa* phalanx fronted by elephants in the center, and heavy cavalry on the right, with an advance and rear guard of slaves or pages. Eumenes commanded around 35,000 infantry, 6,000 cavalry, and 120 elephants. Antigonus' deployment was identical but with the 30 best elephants in an echelon line on his left. He had a similar number of infantry, 10,600 cavalry, and 65 elephants.

Antigonus' left wing commander insubordinately attacked first, charging Eumenes' right wing. He was winning until Eumenes counterattacked with light cavalry and infantry. Eumenes' veterans defeated the enemy phalanx in the center. Antigonus personally led a heavy cavalry charge between Eumenes' phalanx and left wing, bypassing the elephant screen, and easily routed the surprised cavalry salvaging a draw by winning on the left, with Eumenes victorious everywhere else. Eumenes' veterans in the phalanx refused to leave their baggage undefended and so abandoned the battlefield. Antigonus forced his men to encamp on the field and thus claimed a victory. Antigonus may have lost up to 8,000 men and Eumenes up to 5,000.

Parmenion (ca. 400–330)

Parmenion (Parmenio), son of Philotas, was a distinguished Macedonian nobleman and general who served under both Philip II and then Alexander the Great, who executed him in 330. According to Plutarch (*Moralia* 177c), Philip II contrasted himself with the Athenians, who were able to find 10 generals to elect every year, stating “over many years he himself had found only one general—Parmenion.” Despite the high regard in which he held Parmenion, few details survive of his service under Philip. He first appears with a major victory over the Illyrians in 356, campaigning independently of Philip. In 346 he captured the city of Halus in Thessaly and was one of the Macedonian ambassadors who negotiated peace with Athens. In 342/1 Parmenion campaigned on Euboea while Philip was in Thrace. Parmenion also fought in Thrace, probably in 340. In 336 Philip sent him to Asia as commander of the advance guard for his invasion of Asia.

Parmenion’s service under Philip indicates a senior general who could be trusted with major independent commands and diplomatic negotiations. Under Alexander, Parmenion was effectively second-in-command of the campaign, and commanded the left wing at Granicus, Issus, and Gaugamela. However, it is difficult to get a proper idea of his contribution from the extant sources. These tend to portray Parmenion as a cautious foil to the headstrong Alexander. For example, he advocated delay at Granicus and a night attack at Gaugamela. He is also supposed to have advised Alexander to accept Darius III’s peace offer (332), saying that if he were Alexander he would take it (QQ 8).

Parmenion was left in Media in 330 and executed there shortly after his son Philotas, who was with Alexander, was executed for treason. It is highly unlikely that Parmenion was actually implicated in the plot, but Alexander could not afford to let him live—he was too senior and influential and could

provide a focal point for unrest among Macedonians who saw Alexander's policies and practices as increasingly too Persian and un-Macedonian.

Parthia, Parthians

The name Parthian probably derives from the satrapy of Parthava, located in the northeastern part of the Achaemenid Empire, bordered by the satrapy of Hyrcania, the Dasht-e-Karir desert and the Oxus River. The Parthavians provided cavalry for the Achaemenids and later Alexander the Great. In the third century, Parthava experienced a series of incursions by a north Iranian Saka group called the Aparni/Parni—a nomadic peoples from the shores of the Caspian Sea (Strabo, *Geography* 11.7.1). Following these incursions the satrapy came to be called Parthia and its inhabitants the Parthians.

During the third century the city of Asaak north of the Kopet Dag mountains was the Parthian capital. Here, Arsaces was crowned the first Parthian king, establishing the Arsacid dynasty (Isidore of Charax, *Parthian Stations* 11). At the time of Arsaces' coronation, Parthia was a Seleucid satrapy. Arsaces failed in his early attempts to secure Parthian freedom. However, following a revolt by the Parthian satrap Andragoras against Seleucid rule, and Andragoras' subsequent defeat by Arsaces, the kingdom of Parthia was established, comprising the former Seleucid satrapies of Parthia and Hyrcania. The Seleucids were unable to counter this as they were tied up in an ongoing Ptolemaic War.

Arsaces' successors were quick to take advantage of Seleucid misfortune after the Romans defeated Antiochus III the Great at Thermopylae in 191 and Magnesia in 190. Mithridates I (171–139/8) added Bactria, Media, and Mesopotamia to Parthian territory and was crowned king in Babylon. He

also established the city of Nisa/Mithradakert in the former satrapy of Parthia, thereby recognizing the region as the Parthian “homeland.”

The Parthian Empire continued to grow under Mithridates II (124/3–88/7). He secured northern Mesopotamia and brought the city of Dura Europos under Parthian control. Mithridates also entered into formal trade relations with China. The resulting trade routes between Parthia and China became the basis for the silk road.

In 97, Mithridates II subjugated the region of Armenia, which became a major point of contention between Parthia and Rome. The Roman Senate sent Sulla to negotiate with Mithridates, setting the Euphrates as the border between Roman and Parthian territory. After Sulla, both Lucullus and Pompey attempted to meddle in Parthian affairs, but it was Crassus who brought things to a head when he crossed the eastern bank of the Euphrates with his army in 53, breaking the treaty between Mithridates II and Sulla. The resulting battle of Carrhae was an unmitigated disaster for the Romans. Caesar was on the brink of leaving for Parthia to retrieve the lost standards and avenge the loss at Carrhae when he was assassinated. Antony attempted to attack the Parthians in 38, but his campaign was a disaster plagued by tactical errors, betrayal, and desertion. In the end, Augustus negotiated the return of the standards and any surviving prisoners of war. The Euphrates was once again recognized as the border between the two empires although relations remained uneasy, especially with regards to Armenia. Several emperors, including Trajan, Verus, Septimius Severus, and Caracalla attempted to conquer Parthia with little consistent success. Roman invasions of Parthian territory ceased after the emperor Macrinus was forced to pay an extraordinary sum to the Parthian ruler Artabanus to end Parthian hostilities. From this point on Parthia began a slow decline and was eventually conquered by the Sassanids.

Pausanias, Son of Cleombrotus (d. 470)

Pausanias, son of the Agiad Spartan Cleombrotus, succeeded his father as regent for his cousin Pleistarchus, son of Leonidas, was given high command of the Greek forces in 479 and displayed admirable behavior at first. He defeated Mardonius' army at Plataea, refused a Greek suggestion to mistreat Persian corpses, and contrasted the austerity of Spartan food with opulent Persian food, astonished that Persians would invade so poor a country as Greece (QQ 31), supporting Herodotus' strong theme of environment's relation to culture. Over the next two years he led the Hellenic coalition against Persia, subduing Cyprus and Byzantium.

However, Pausanias' hubristic behavior began to repel the coalition, who complained. He was officially recalled to Sparta. Accusations surfaced that he had received a letter from Xerxes proposing a marriage alliance, wore Persian outfits, had Median and Egyptian bodyguards, indulged in Persian-style banqueting, and had developed a despotic, violent temper. This change in behavior was either the prime reason, or a pretext, for the Greek coalition's leadership being transferred to Athens. He was convicted for private acts of oppression but acquitted for medism (collaboration with the Persians). Pausanias then went to Byzantium without state backing, and was recalled to Sparta again in the second half of the 470s. Before his arrival he is reported to have made some sort of promise of freedom to the Helots. Convicted of this and of medism, he fled to the temple of Athena of the Bronze House. Rather than sacrilegiously slaying a suppliant, agents of the Spartan state enclosed the temple and let him die of hunger. This, however, was not enough to avoid later charges of sacrilege being leveled against Sparta.

Pausanias, Son of Pleistoanax (ca. 450–ca. 380)

Pausanias of the Agiad royal house at Sparta reigned 446/5 to 426, for a long period at first as a minor, when his father Pleistoanax was in exile. He became king again when his father died in 409/8.

Pausanias played no part in the Peloponnesian War until 405, when he brought up an army from the Peloponnese to join in the siege of Athens. In 403, out of jealousy at Lysander's power in dealing with the democratic uprising in Attica, Pausanias persuaded the Ephors to give him the command. In spite of some losses in clashes with the democrats, he encouraged them to make settlement with their opponents. The reconciliation between the two sides reestablished democracy in Athens. The small separate state created at Eleusis for the extreme oligarchs was subjugated by Athens in 401.

At this point, if not earlier, Pausanias was put on trial and narrowly acquitted. His policy of trusting that a democratic Athens would be a loyal Spartan ally was obviously controversial. When the Corinthian War broke out in 395 Pausanias led a force into Boeotia but he did not link up in time with Lysander, who was defeated and killed at Haliartus. Faced with prosecution for this failure, and with his Athenian policy in tatters, Pausanias fled into exile at Tegea, where he died.

Pay, Military

Military pay is a fixed regular payment (agreed in advance) paid by an employer (such as a city-state or king) to a sailor or soldier in return for military service. Military pay can be paid in money or in kind (i.e., in goods and/or services).

There is no military pay as such in our first surviving descriptions of Greek warfare: Homer's *Iliad* and *Odyssey*. In the Homeric world—which reflects, underneath a supernatural sheen, the Greek world of the late eighth and early seventh centuries—men participating in military operations did not receive fixed regular payments in return for their service. Instead, they were rewarded in other ways. They could be treated to a feast before setting out on a campaign, for example, or receive gifts of food and drink for overseas military expeditions. More importantly, Homeric fighters expected to receive a share of any booty won in a war or taken in a raid. A successful leader of a war or raid (always a king or another high-ranking man) distributed booty on the basis of his soldiers' status and their efforts in the fighting. Failure in war or raiding therefore meant that fighters received no tangible profit from their service.

For most of the rest of the Archaic Period (ending ca. 480), too, there was no military pay for men taking part in wars or raids. The brief campaigns during this period were mostly undertaken against neighboring cities, so fighters could depend on food they brought from home and on foraging in enemy territory. For slightly longer operations, the supplies soldiers acquired themselves may have been supplemented by gifts of food and drink from their aristocratic military leaders. In addition, throughout the Archaic Period each man could still expect a share of the booty from successful campaigns (the size of the share depending as before on his status and performance in the fighting).

The earliest explicit reference to military pay in the Greek world, concerning the payment of sailors sailing on foreign expeditions, is in a law of the city of Eretria (on the island of Euboea) from the last quarter of the sixth century. Three major factors led to the introduction of pay in the late sixth century for men on naval service. First, the adoption of coinage by cities in the Greek world over the course of the sixth century provided a more convenient means for cities to pay fixed wages to their military forces. Second, central authorities within Greek cities grew in power over the

course of the sixth century. These more powerful central authorities meant that cities could more efficiently mobilize their citizens for military service and use increased public revenues (raised in coin from sources such as indirect taxes and fines) to pay for that military service.

Third, and linked to these first two factors, the growing use by Greek states of the trireme to fight their wars on sea from the third quarter of the sixth century onward forced cities to introduce pay (in coin) for naval service. Triremes required crews of 200 men (in contrast to previous Greek warships which contained 30 to 50 men), so fleets of triremes required much more food than previous fleets. But because of the lack of space on board Greek triremes—200 men crammed into a ship 35 meters (115 feet) long, 6 meters (20 feet) wide, and 3 meters (10 feet) high did not leave much room for storage—sailors departing from their home cities for overseas expeditions could not take with them more than a few days' supplies. So that their trireme fleets could resupply themselves away from home, cities therefore had to provide pay to their crews to use in friendly territory to buy food in markets provided by friendly and allied cities. In hostile territory—where the increased numbers of men aboard triremes now meant that foraging was no longer a supply method that could readily be used to feed fleets—naval crews could use their pay to buy food in markets provided by private traders who sailed alongside their ships as a sort of supply train.

With the introduction of pay, the capacity of Greek states to find sources of money for their rowers now became a central and determining factor in the outcome of their naval and overseas wars. The more money a community could raise, the more sailors it could pay—and it could pay them for longer periods of time. Finding a reliable source of pay for their trireme crews was therefore an important consideration in the discussions of the Ionian Greeks before their revolt against the Persians in 499. The discovery of rich lodes of silver at Laurium in the 480s enabled the Athenians to not only construct the largest trireme fleet in the Greek world but also to pay the men sailing these triremes during the Persian invasion of 480–79.

In the decades after the Persian Wars, the Athenians were able, thanks to their silver mines and (even more importantly) to the tribute coming in from the subjects of their empire, to amass unprecedented amounts of silver. This enabled them to send out navies—accompanied by land forces—to engage in overseas operations much longer than any mounted previously by a Greek state. Using the pay they received from the state to buy their food

from traders, the tens of thousands of sailors and soldiers on Athenian overseas expeditions in the mid and later fifth century often besieged rebelling cities for months, and even years, at a time.

It is unclear when exactly pay for military service on land campaigns was introduced in the Greek world but, at least by the time of the early years of the Peloponnesian War (431–404), it was taken for granted that all states would provide pay for their soldiers serving both on sea and on land. The first evidence for how much Greek sailors and soldiers were paid in return for their military service also comes from this period. One drachma a day (paid monthly) was the usual rate of pay for sailors and soldiers in Athenian forces in the first two decades of the war, while three Aeginetan obols per day (again paid monthly) was the standard rate of pay for Peloponnesian infantrymen. (Three Aeginetan obols equaled 4.325 Attic obols; there were 6 obols in a drachma.) Rates of pay did not differ by rank or by type of service in state military forces, with the exception of cavalry—horsemen usually received double the pay given to infantrymen to enable them to feed their mount.

Since one or two obols could purchase enough food to live on for a day, pay rates at this time (which were roughly equivalent to what other public workers received at Athens in the late fifth century) gave men on military campaigns the potential to make a tidy profit. The opportunity for monetary gain from service was even greater at Athens for men with special skills—such as *thranitai* (the rowers on a trireme's uppermost bench) and helmsmen—who, in addition to the standard rates paid by the state, could be paid bonuses by trierarchs competing to recruit the best quality crews possible. Individuals serving in Greek military forces in the Classical Period (from ca. 480 to 323) could no longer expect, however, to receive a share of any booty won on campaign: plunder (and the profits from its sale) was now under the control of the state.

The monetary resources available to or possessed by Athens and other military employers determined how much they paid their military forces. While they ruled their empire, the Athenians were exceptional in the concentrated wealth they were able to accumulate and could pay their men well for extended periods of time. When the Athenians lost the power to extract tribute from their subjects in the last years of the Peloponnesian War, however, they had to halve their sailors' pay. Even then, Athenian generals still had to resort to desperate measures such as sales of plunder

and exactions of money from cities to fund their fleets. Since the Spartans and their allies lacked any reliable income stream large enough to support lengthy foreign campaigns, their naval forces fighting the Athenians at this time were only able to do so because of Persian financial support. But the Persian king proved to be a notoriously unreliable payer, and so sailors on Peloponnesian triremes were sometimes, too, forced to scrape for funds (even spending part of one summer as farm workers to earn enough money to live on).

No fourth-century Greek city-state was ever able to develop sources of revenue consistent or large enough to ensure that their forces would be regularly and reliably paid for any extended period of time. The Arcadians did seize control of the great sanctuary of Olympia in 364 and the Phocians Delphi in 356 to use the great wealth built up in the treasuries of these religious centers to finance large armies, but these treasuries were not sustainable sources of long-term military funding (or sources acceptable to other Greeks). For all other armies and navies, since the public finances of cities never quite matched their military ambitions, funding—and so the pay of the men who made up these forces—always remained uncertain. Even with the lower rates of pay in this period, overseas forces, in particular, often had to rely on plunder or exactions from cities to raise money to survive. Probably because of long experience of the inability of their states to deliver pay regularly or in full, it was common practice during this period for sailors and soldiers to bring their own money to spend while on campaign.

In response to the pressures military pay put on public treasuries, a new system of military payments emerged at Athens and other cities in the Greek world by the middle of the fourth century. Military pay, instead of (as before) being considered (and disbursed as) one payment, was now understood as consisting of two payments, one for subsistence and one for pay proper. The Athenians (and other city-states) were often in a position to provide only enough money to cover the first subsistence payment and left the cash for the second payment to be raised from the personal resources of trierarchs or sales of booty.

In the middle of the fourth century Philip II of Macedonia seized control of the silver and gold mines along the coast of Thrace. He used the enormous income he received from these mines both to pay large numbers of mercenaries, and to raise and train a large army of Macedonians into a

force more organized and efficient than any army previously seen in the Greek world. The exceptional revenues Philip possessed also enabled him to use this army on prolonged campaigns and so to take control of mainland Greece. These revenues and this army formed the basis, too, for his son Alexander's initial operations in his invasion of Asia. Alexander experienced problems paying his men on their march through the interior of Asia, but was able to use the vast wealth amassed in the capitals of the Persian Empire to pay his men monetary rewards previously undreamt of by Greek armies.

In the Hellenistic Period, the distinction between pay and subsistence rations, which had emerged in the middle of the fourth century, became established practice. With the formation of permanent kingdoms in the territories conquered by Alexander, Hellenistic royal dynasties could build up massive reserves of foods such as wheat, olive oil, and wine through taxation-in-kind and to mobilize these reserves to support their armies and navies. Hellenistic rulers used these resources and their vast monetary revenues to give their soldiers two payments in return for their service: pay (proper) in coin and (for the first time in Greek history) a payment of rations in kind—although the value of part or all of this second payment was often converted into and paid in coin. In the latter case, Hellenistic soldiers could be offered markets by their employers in which basic foods were sold to them at fixed prices (which were lower than the market prices for these foods).

Hellenistic rulers enjoyed resources much greater than any city-state ever had and therefore could raise much larger forces and pay their soldiers all year round—so creating the first permanent standing armies in the Greek world. Sometimes even Hellenistic kings, however, ran out of money to pay their men and had to resort to extraordinary (and dangerous) measures such as the plundering of temples to finance their campaigns. It would only be when Roman armies conquered the Greek world in the late third and second centuries that the funding of military force in this region would be fully secure.

Peace (*Eirene*)

In Aristophanes' comedy *Peace*, produced in Athens in spring 421, just before the concluding of the Peace of Nicias, the deity Peace (*Eirene*) has to be hauled out of a cave by Greek peasants, led by the Athenian Trygaeus. Earlier in the play War (*Polemos*) and his attendant Confusion (*Kudoimos*) have both speaking roles and take part in the action. In contrast peace is a silent figure, apparently represented on stage by a dummy. In the comedy, there is much about the blessings of peace, especially simple country life and the enjoyment of good food, and much dislike expressed of the hardships of military service and the arrogance of military men. Peace is addressed as "Divine Lady, mistress of dancing and weddings" (lines 974–5).

Aristophanes' *Peace* encapsulates the common Greek understanding of peace: it is difficult to attain, more often a matter of wishful thinking than reality, and fondly associated with the simple pleasures of life. Greek thinking about peace does not go beyond these obvious commonplaces.

Imagining peace as a goddess came readily to Aristophanes and his audience. Personifying abstract ideas such as Victory (*Nike*) or Good Order (*Eunomia*) was a common feature of Greek religious imagination. In actual practice, the first and only cult of Peace as a deity in Greece was established in Athens in 375/4, to celebrate the conclusion in that year of a Common

Peace treaty that gave some advantages to Athens, especially in comparison with the King's Peace of 387/6. A famous statue of Peace was made by the sculptor Cephisodotus, perhaps the cult-statue in her shrine. A late copy may be seen in the Glyptothek in Munich (no. 219). Peace is depicted as a beautiful woman, nursing the child *Plutus* (Wealth): she is the nurturer of life and bringer of prosperity, as all Greeks knew. However, this Athenian cult of Peace is as much a celebration of victory as the golden statuettes of Nike, the goddess Victory, which began to be dedicated on the Athenian Acropolis from this year on.

The modern student who turns to introductory or other works on ancient Greek history and society will usually find in the index plenty of entries on "War" or "Warfare," but none on "Peace" as a general concept. The word "Peace" (*eirene*) was also used in Greek in the concrete sense of a peace treaty, and index entries on "Peace" in this sense will be found (e.g., King's Peace, Peace of Philocrates), but that is all.

No Greek politician was ever idealistic enough to envisage a permanent end to war. It was hard enough to bring about a settlement ending a war. Down to the end of the fifth century peace treaties, like alliances, were usually made for a specific number of years. It might be expected that such treaties could be renewed and, from the fourth century onward, such treaties were usually made "For Ever" or for the indefinite future, no time limit being specified. No one expected these treaties to be perpetual.

The tenuous nature of peace in a world in which war was the commonest, if not the most effective, way of ending disputes between states may be seen from a pair of published speeches. Isocrates 8, *On the Peace* (ca. 355) shows the insecure basis of the peace treaty ending the Social War (357–355). Demosthenes 5, *On the Peace* (late summer 346) is a clever effort to insinuate that, while Athens has no choice but to acquiesce for the time being in the Peace of Philocrates, peace with Philip will not last.

King Pyrrhus of Epirus is reported (Plutarch, *Pyrrhus* 14) to have been asked by his chief diplomatic agent Cineas of Thessaly what he intended to gain by his forthcoming campaign in Italy (280–275). Pyrrhus answered the conquest of Italy. In reply to a series of more questions Pyrrhus gave conquest after conquest as his goal: Sicily, Carthage, Macedonia, and Greece. With all that accomplished, he said, he could relax and enjoy good wine and good company. Cineas told him that he could enjoy these good things now but Pyrrhus did not take the point. Cineas, it should be noted,

was arguing not against war in general but against a particular, ill-advised war.

It follows that there were no pacifists and no pacifism, in the sense of a principled rejection of war, in ancient Greece. It was quite different to work toward or to wish for the ending or the avoiding of a given war, but describing either Nicias or Phocion as a pacifist is an abuse of the term.

Peisistratidae

An aristocratic family prominent in sixth-century Athenian political conflict. The most famous member of the family was Peisistratus, tyrant of Athens, but the term "Peisistratidae" is generally used to refer to his sons, Hippias and Hipparchus, or to the family in general.

Hippias became tyrant when Peisistratus died in 528/7 and initially continued his father's successful policy of maintaining rule through personal popularity, good government, and observing existing laws. He maintained reasonable terms with other powerful aristocratic families, allowing Cleisthenes (525/4) and Miltiades (524/3) to be archons. Hippias also continued his father's policy of public works, including building or renovating several major religious buildings in Athens.

Thucydides, among others, comments favorably on the early years of the Peisistratidae. However, Hippias' younger brother, Hipparchus, was

regarded as a playboy and according to Thucydides his failed attempt in 514 to seduce Harmodius, the lover of an older man, Aristogeiton, led to the end of the Peisistratid reign. Rejected by Harmodius, Hipparchus deliberately insulted his sister. Harmodius and Aristogeiton had already begun plotting to overthrow the tyranny and this insult spurred them to action. They succeeded in assassinating Hipparchus at the Greater Panathenaic Festival but missed Hippias. Harmodius was killed on the spot and Aristogeiton captured and tortured to death. There were a number of other conspirators, suggesting political as well as personal motives for the attack.

After this, Hippias implemented a much harsher rule. The Alcmaeonidae went into exile again and Herodotus claims that after one failed military attempt to return they bribed the Delphic oracle to encourage Spartan intervention. Despite their previously good relations with the Peisistratidae, the Spartans decided to end the tyranny. Anchimolius led the first attempt, landing at Phalerum, where his force was defeated and he was killed by Hippias' army, aided by 1,000 Thessalian cavalry. However, another Spartan attack in 511/10 forced Hippias and his relatives into exile.

Hippias fled, ending up in Asia Minor. The Spartans, who had soon decided it was a mistake to expel Hippias, failed to convince their allies to attack Athens and restore Peisistratid rule. Persian insistence that Athens should restore Hippias was similarly ineffective and probably influenced Athenian participation in the Ionian Revolt. Hippias' last known attempt to regain the tyranny was in 490 when he accompanied the unsuccessful Persian landing at Marathon.

Peisistratus (ca. 600–528/7)

Peisistratus was a leading and very successful contender in sixth-century Athenian political conflict post-Solon. This conflict was family- and clan-based and involved the full spectrum from factional maneuvering, through assassination, to the use of large-scale armed force. Peisistratus was tyrant of Athens three times.

Born ca. 603–598, Peisistratus came to prominence in the mid-560s by capturing Nisaea from Megara. In 561/60 he faked an attack on himself, persuaded the assembly to vote him an armed bodyguard and then seized power with it. He was expelled after about five years when the other two faction leaders, Lycurgus and Megacles, temporarily united against him.

Shortly afterward, Peisistratus allied with Megacles, married his daughter, and returned to Athens as tyrant. However, Peisistratus' second tyranny was probably even more short-lived than the first. As the Alcmaeonids were reputedly cursed and he already had children, Peisistratus did not want more by Megacles' daughter. Megacles was incensed and realigned with Lycurgus; Peisistratus went into exile.

Peisistratus spent around 10 years preparing for his return. He raised money from mining interests in the north and allied with Eretria, Thessaly, Thebes, and Lygdamis, a prominent citizen (and later tyrant) of Naxos. With men and money from these places and mercenaries from Argos, Peisistratus landed at Marathon and defeated the Athenian army at the battle of Pallene.

Peisistratus' third tyranny was his most successful, lasting from around 545 until his death in 528/7. He maintained his power by mixing traditional security measures with personal popularity derived from good government. Internal security measures included perhaps disarming the people (according to the *Athenaion Politeia* 15.4, but apparently contradicted by Thucydides 6.56.2, 58.1), taking hostages, and maintaining a force of mercenaries—all reinforced by external military alliances. However, Peisistratus kept this in the background, maintaining his position more by his popularity.

Peisistratus retained the existing laws and customs and ensured peaceful local government and fair administration of justice. The Areopagus was retained and Peisistratus also permitted aristocrats from other factions to hold the archonship at various times during his tyranny. He boosted the economy, partly through a program of public buildings, including ensuring

the city's water supply, and made personal loans to the poor. Peisistratus also took steps to unify Attica. He appointed circuit judges to administer uniform justice in the countryside and regularly toured Attica. As part of this policy, Peisistratus also purified Delos (the Ionian religious center) and enhanced the Panathenaic festival. He (or Hippias) may also have minted coins depicting Athena.

Peisistratus' three tyrannies illustrate the very personal and competitive nature of aristocratic politics in Greece. His alliance with Megacles collapsed over his treatment of Megacles' daughter and Peisistratus' return to power was based in part on aristocratic contacts elsewhere.

Later assessments of Peisistratus' tyranny by Herodotus, Plutarch, and in the *Athenaion Politeia* are all favorable. These stress the moderation of his rule and the prosperity and stability it brought to Athens. Peisistratus retained the existing forms of government and in some ways continued the process started by Solon, who had made wealth rather than noble birth the basis for holding political office in Athens. In general, Peisistratus' rule diminished the power of the aristocratic clans, increased the unity of Attica, and built up a sense of Athenian identity. All of these played an important role in paving the way for Cleisthenes' democratic reforms.

Peithon (ca. 350–316)

A *somatophylax* (bodyguard) of Alexander the Great. He does not seem to have played a prominent role during campaigning, but was a trierarch of the Hydaspes fleet in 326, and was distinguished with a gold crown and a

Persian bride during the Susa weddings in 324. Peithon spoke against the nomination of Philip III Arrhidaeus for the kingship, and instead proposed that Perdiccas and Leonnatus should have joint guardianship over Roxane's child. For his support he received the satrapy of Media and was sent to suppress the Greek rebellion in the upper satrapies.

Peithon seems to have harbored ambition for greater power, but was unable to make anything of it. He was for a brief time a guardian of the kings, but lost this to Antipater. He later joined Perdiccas and was with him for the disastrous expedition in Egypt (321/20), where he became a member of the mutinous party that murdered Perdiccas. He made several attempts to better his position, and allied first to Seleucus, then Antigonus I Monophthalmus. Antigonus found him a useful ally but soon suspected Peithon of plotting rebellion. Antigonus tricked Peithon by pretending he was going to hand over the army and upper satrapies to him, and instead had him executed.

Pelopidas (ca. 410–364)

Pelopidas was a distinguished military and political leader in the Boeotian state after the liberation of Thebes in 379/78. Exiled by the pro-Spartan oligarchy imposed in ca. 382, Pelopidas was a leader of the small group that carried out the coup that overthrew the oligarchy. He was then elected one of the Boeotarchs, the board who were the chief executives of the new Boeotian state, and went on to hold this annual office 13 times.

In 375, Pelopidas showed his tactical brilliance by defeating a small Spartan force at Tegyra. At the battle of Leuctra (371), he played a key role

while commanding the elite infantry regiment, the Sacred Band. Pelopidas shared the command with his friend Epaminondas on the first Boeotian invasion of the Peloponnese in winter 370/369. Along with Epaminondas, he was put on trial for exceeding his legitimate term of office but was acquitted. Up to this point Pelopidas had been closely associated with Epaminondas' policies of securing Theban dominance in Boeotia and breaking Sparta's power in the Peloponnese. In 369-8 Pelopidas took the lead in a new initiative to establish Boeotian supremacy over Thessaly and Macedonia, the regions to its north. He freed Larissa in Thessaly from Macedonian rule and supported the Thessalian cities opposed to Alexander, tyrant of Pherae. He made Macedonia into a Boeotian ally and among the hostages brought to Thebes was a young prince, Philip, later to rule Macedonia as Philip II. While on a combined military and diplomatic mission in Thessaly in the next year, Pelopidas was captured through trickery by Alexander of Pherae. An expedition led by Epaminondas secured his release.

In ca. 367, Pelopidas led a diplomatic mission to the king of Persia and persuaded him to transfer his support away from Sparta to Boeotia. However, in the event the Persian king had neither the will nor the means to compel Greek states to accept the terms he laid down.

In 364, Pelopidas led into Thessaly a Boeotian army that combined with the free Thessalian cities to defeat Alexander of Pherae at the battle of Cynoscephalae. Although victorious, Pelopidas, still angry at his imprisonment, was killed while rashly pressing forward through the enemy to personally kill Alexander.

Peloponnesian League

Modern scholars call Sparta's alliance system in the Archaic and Classical Periods the Peloponnesian League, although it was not a federal state like the Boeotian League. Ancient writers described this alliance more accurately as "The Lacedaemonians and their allies." Its early structure consisted minimally of influence exercised by encouraging pro-Spartan politicians and oligarchies in each friendly state, and discouraging or sometimes expelling tyrannies and democracies, and maximally of separate, ostensibly eternal, bilateral alliances between Sparta and each allied member state. League armies were called up at need from the members on an *ad hoc* basis, with Spartans assigning a required levy from each member.

Uncertainty necessitates much guesswork. Some cities joined because they felt threatened by Argos, the other sixth-century Peloponnesian hegemon; some whose tyrants the Spartans expelled felt pro-Spartan loyalty. Tegea's incorporation into the League (ca. 550) probably set a precedent for many member states to cede some control over their foreign policy to Sparta. Each member seemingly possessed one vote; only Sparta could convene representatives of the League. But not all members were deferential. Two levels of allies may have existed, one more independent than the other. Larger *poleis* like Corinth enjoyed considerable latitude. Corinth's involvement in the First Peloponnesian War (460/59–445) and with Corcyra and Epidamnus (late 430s) include no Spartan approval. At League meetings, Corinthian delegates boldly criticized Sparta. A myth of common Dorian descent, and religious institutions such as the Olympia festival, provided some unity. Corinth, Elis, Tegea, Orneae, Phlius, and eventually most towns in the Peloponnese became members, as did Thebes.

During the Persian Wars, the League expanded into a larger Hellenic anti-Persian alliance including most Greek *poleis*, with Sparta as leader. Afterward, Sparta withdrew from this larger alliance (partly because of Greek hatred against Pausanias) and retired back to its Peloponnesian allies while Athens headed the Delian League. The Peloponnesian League's most unified performances begin in the battle of Tanagra in 457, and continued in its defeat of Athens during the Peloponnesian War (431–404)—assisted by considerable funds from the Persian Empire. Sparta's subsequent imperial phase featured strong enforcement of the League's obligations. Sparta's weakening after Leuctra (371) freed some allied states to seek other forms of

protection such as the Arcadians, who formed their own federal state. An attenuated Peloponnesian League remained until Philip II of Macedon dissolved it in 338 to create the League of Corinth.

Peloponnesian War, First (460/59–445), Causes

This complex, poorly understood war clashed Athenians against several Peloponnesian *poleis*, stemming from Athenian attempts to create both a land and sea empire and from Corinthian westward ambitions. The war's roots may partially lead back to Spartan displeasure over Athens taking over its leadership of the anti-Persian panhellenic sea alliance. Although Athenian assistance to Sparta during a Helot revolt after the earthquake of the 460s suggests friendliness, Sparta dismissed the Athenian force early, suspicious of Athens' democratic sympathies. In response, the Athenians ostracized their Sparta-friendly politician Cimon. Without Cimon's influence in the Athenian Assembly, policies that did not include appeasement of Sparta became possible. Athens concluded an alliance with Sparta's enemy Argos, allied with Thessaly, and settled Sparta's rebellious Helots in Naupactus, whose gulf location threatened the Peloponnesians, particularly the Corinthians. Around 460, the Megarians, involved in a border dispute with Corinth, revolted from the Spartan alliance. They allied

with the Athenians, who secured Megara and its port Pegae with garrisons and long walls to Megara's harbor Nisaea. Corinth perceived this as a threat, but Spartan interference seemed unlikely considering their lengthy Helot uprising.

Peloponnesian War, First (460/59–445), Course

Athens unsuccessfully fought Corinthians and Epidaurians in 459/8 at Halieis, and in a naval battle at Cecryphalea defeated “the Peloponnesians,” either a purely geographic term or indicating the Peloponnesian League. Athens then besieged Aegina, which eventually submitted and joined Athens’ Delian League. Athens’ combination of control over Megara, Naupactus, and Aegina, as well as its alliance with Corinth’s rival Argos, understandably intimidated the Corinthians, who next (458) invaded Geraneia but suffered a debacle in the Megarid, incorrectly assuming that Athens would be too busy with numerous wars to help its new allies.

Spartan entrance into the war occurred when unrelatedly, in spring 457, the Phocians campaigned against the original *metropolis* of the Dorian Peloponnesians, Doris, which also represented Sparta’s wishes on the Amphietyonic League. The Spartans forced the Phocians to make terms and started home; however, at Tanagra, 14,000 Athenians and allies attacked them, suspecting a plot against the Athenian democracy. The Spartans won

and went home. Next the Athenians defeated the Thebans at Oenophyta, and took Tanagra, holding all Boeotia except Thebes for a decade. This marks Athens' attempt at creating a land empire in addition to its sea empire. Athens meanwhile completed her own Long Walls. Theoretically, walling Megara also and connecting it to Nisaea would have given Athens a walled fief north of the Peloponnese.

Athens' aggressive subsequent actions included successfully besieging Aegina, which was enrolled in the Delian League, and, in 456–454, raiding the Peloponnese and Acarnania. Thucydides states (1.112.1) that next the Peloponnesians and Athenians made a truce for five years, presumably in 451. War in Cyprus and Egypt occupied the Athenians next for several years, until a flurry of revolts broke out against Athens. Additionally, Athens meddled in Delphi against Spartan wishes around this time, giving Delphi back to the Phocians after the Spartans had returned it to the Delphians. In 448 Athens quelled a Megarian revolt, but (probably in 447/6) some Boeotian exiles regained several *poleis* in Boeotia and, at the battle of Coronea, the Boeotians defeated the Athenians, later represented as a war of liberation against Athens. The Athenians evacuated all Boeotia, after having occupied it for a decade, now agreeing to allow cities there (except Plataea, which remained Athens' ally) to choose their own form of government. This defeat noticeably weakened Athens, and in 446, several events seem to have added up to a carefully-calibrated, multifront effort to hit Athens simultaneously. First, Euboea, resenting Athens' cleruchies (military settlements), revolted against Athens. When Pericles entered Euboea with an army, he learned that Megara with Corinthian, Sicyonian, and Epidaurian help had revolted and killed its Athenian garrison, and the Peloponnesians were on the point of invading Attica. Pericles rushed his army back from Euboea to discover that a Peloponnesian army had ravaged Attica up to Eleusis and Thria, and then gone home. Desperately, the Athenians then crossed over again to Euboea, subdued the whole island, expelled the Histiaeans, and occupied Histiaea. Finally, in 446 the overstretched and exhausted Athenians made a peace treaty with the Spartans and their allies that was intended to last 30 years.

Peloponnesian War, First (460/59–445), Consequences

Thucydides and Diodorus agree at least on the contours of the peace made in 446, detailed more in Diodorus 12.26.2. Athens had overextended itself as a power. Peace terms included Athens giving up its posts in the Peloponnese, Nisaea, Pegae, Troezen, and Achaëa; freedom for each alliance leader to use violence to resolve conflicts among its allies; that a hegemon could not interfere with allies listed in the opposite hegemon's alliance; and autonomy for neutral *poleis*, but not listed allies, to make alliance with either hegemon.

This war's most significant consequence was Athens' loss of its central Greek land empire and other subordinate partners on the Peloponnese: 16 years of war for territorial extension ended with Athens having won nothing more than she had held in 461. Its actions had additionally made Athens' territorial acquisitiveness obvious and unpopular. However, it left Athens with many other opportunities east, west, and to the Black Sea, and Athens' sea empire and Sparta's Peloponnesian League both remained intact. With the example of Euboea, which Sparta allowed Athens to harshly discipline, it left Athens' allies the knowledge that Sparta would not necessarily protect them against Athens.

Peloponnesian War, Second (431–404), Causes

Scholars continue to debate the precise trigger of the Peloponnesian War, which lasted from 434 to 404, but the chief contemporary source, an Athenian named Thucydides, believed that the Athenian Empire had incurred the anger of other Greek city-states threatened by its power. He wrote that some states had lost their independence to Athens, and others, especially Sparta (one of the more powerful rivals of Athens), feared that they might as well. The most likely causes of the war are to be found in the events of the fifth century that followed the creation of the Delian League in 478/7.

During the 50-year period after 480 (sometimes called the *pentacontaetia*), Athens had become increasingly powerful, mainly by drawing on the Delian League, an alliance network that had evolved into an empire. At the same time, Sparta had some internal difficulties but remained leader of the loose alliance called the Peloponnesian League. The First Peloponnesian War, a conflict between members of the Delian and Peloponnesian Leagues that began in 461 over Athenian expansion on the mainland ended without serious result in 446 with the Thirty Year Peace. In the years that followed, free to strengthen its control over its allies, Athens grew even stronger and wealthier under Pericles' leadership. All of this concerned other Greek city-states, including several allies of Sparta. This growing fear of Athens was the general cause of the war, but it still required a series of incidents to actually trigger the conflict.

The first incident started in a small Greek city on the Adriatic coast,

Epidamnus. A civil war between pro-oligarchy and pro-democracy supporters in Epidamnus, a colony of ancient Corcyra, broke out in 435. The pro-democracy side sought support and ended up turning to Corinth, the city that had originally founded Corcyra. Corinth was an oligarchy, but it was also a long-term enemy of Corcyra, so it came to their support. The Corcyraeans resented what they perceived as meddling and armed conflict broke out between the two cities. Corcyra fared poorly and eventually made an alliance with Athens, despite the risk of breaking the Thirty Year Peace should Athens engage in battle against Corinth. In 433, Corcyra, with Athenian assistance, defeated Corinth at sea. Corinth, already afraid of Athenian influence, saw Athenian intervention for the threat that it was (in helping Corcyra, Athens gained an even larger navy) and complained to Sparta. The Spartans, however, did not declare war.

The second flashpoint occurred in the northern Aegean at Potidaea. This city, located on the Chalcidice Peninsula, was a former colony of Corinth, but also a member of the Delian League. Despite its alliance with Athens, Potidaea and Corinth maintained close political and economic ties. During 433–432, the Athenians demanded in decrees that Potidaea dismiss its Corinthian magistrates and submit to Athenian authority. When their demand was rebuffed, the Athenians laid siege to its ally. With active support from Corinth and Perdiccas, the king of Macedonia, the Potidaeans held out for two years. In support of its former colony, Corinth again appealed to Sparta repeatedly for the Peloponnesian League to declare war, but to no avail.

The final trigger occurred in Megara when Athens moved against its neighbor and former ally. A city-state just west of Athenian territory and east of Corinth, Megara had been an early member of the Peloponnesian League but in 460 joined the Delian League until 446. In 432, probably under Pericles' direction, Athens issued the Megarian Decrees that included several restrictions, most important of these banning Megarian merchants from Delian League ports. The advantage of such a measure on Pericles' part was that it allowed Athens to cause harm to a member of the Peloponnesian League without violating the peace treaty. Megara was reliant upon maritime trade for its success, and all the important ports were in the Delian League, so this decree was particularly damaging. Despite repeated requests, Athens would not rescind the decrees. As a result, Megara joined Corinth's previous appeals to Sparta for Peloponnesian

League action. Although the decree appears extraordinarily provocative, Thucydides saw it as a mere pretext for the later war.

The combination of Megarian and Corinthian appeals finally stirred Sparta to decide that the combination of provocations had violated the peace treaty. Negotiations toward a resolution with Athens dragged on over the winter of 432–431. Then, in 431, the city of Thebes, a member of the Peloponnesian League, attacked the city of Plataea, an old Athenian ally, and the war was underway. As with so many wars, neither side probably expected the war to last as long as it did or to have such far-reaching consequences.

It often appears to modern readers, as it did to later ancient authors, that Athens held the bulk of advantages and should have won, and so may have provoked a war in time of strength. It is important to remember, however, that for contemporaries the outcome was not a foregone conclusion. Also, much of the knowledge of these events comes from Thucydides' account, in which, despite his Athenian bias, he constructs a superb literary work that builds the drama inherent in the conclusion of the war.

Peloponnesian War, Second (431–404), Course

Between 431 and 404, the Peloponnesian War raged throughout Greece and the Aegean Sea, and even as far west as Sicily, as Sparta and its allies in the Peloponnesian League fought against what had become the Athenian Empire. It was to be an odd war in which the best Greek army faced the best navy, but Athens had the additional advantages of offensive mobility by sea and plenty of funds. Many Greek cities and even Persia became involved in the war so that it had an impact on nearly every part of the Greek world. The war ended in defeat for Athens and dissolution of its empire.

Throughout the period after 478, Athens had become increasingly powerful, mainly by drawing on the Delian League, an alliance network that had evolved into an empire. After a series of what appeared to Spartan allies as provocations, Sparta, led by King Archidamus II, declared Athens in violation of the existing peace treaty and the war began in 431.

According to the primary source for this period, Thucydides, both sides had a strategy for victory. Archidamus planned to draw the Athenians out to battle and win a swift victory on land that would result in the collapse of the Delian League. Pericles, the leader of Athens, advised his fellow citizens to remain behind their walls, secure with their large wealth reserves to maintain the fleet and import food but also raid the coastline of the Peloponnesian League members.

The first phase of the war, sometimes called the Archidamian War, lasted 10 years and began with a Spartan invasion of Athenian territory. Pericles pursued his semidefensive strategy with great effect. The invasion raided Attica but left Athens itself untouched, and after some desultory destruction the Spartans withdrew. The next year, while the Athenians remained behind their walls, a plague struck Athens and reduced its population. This not only affected the numbers of men it could field, but also cost the city-state one of its most capable leaders, Pericles, in 429.

During the early years of the war, there were victories on both sides, but the Athenian occupation of Pylos and capture of some Spartan citizens scared the nearby Spartans into suing for peace in 425. The Athenians, seeing their advantage, refused. Sparta responded by campaigning in the northern Aegean and eventually capturing Amphipolis in 422. This success led directly to the Peace of Nicias (421), which was intended to restore the

status quo, with both sides returning captured territory.

The treaty may not have been fully implemented, but it initiated a period of uneasy peace during which Athens sought to expand its empire by alliance with Argos, the conquest of Melos, and then a great expedition to Sicily in 415. That campaign in the west proved costly to Athens, as its huge force was defeated at Syracuse in 413. That expedition led to the end of the peace and the beginning of the second phase of the war, called the Decelean War.

During the Siege of Syracuse, Sparta was not idle, invading Attica again and occupying a fort at Decelea. Sparta also focused on building up its fleet to take advantage of the battered state of the Athenian navy. A significant portion of the Athenian fleet was destroyed in the attack on Sicily and with it, the men to man the new ships Athens was desperately trying to build. Also in the aftermath of Syracuse, several members of the Delian League revolted and this further occupied Athenian attention. Between 411 and 408, Athens experienced a *coup d'état* in favor of oligarchy and then a restoration of democracy, the continued rebellion of several allies, and food shortages caused by Spartan naval successes. However, a major Athenian naval victory at the battle of Cyzicus in 410 decimated the Spartan fleet and revived Athens' hopes of winning the war.

Despite the fact that Athens had secured its supply lines and even reclaimed a few of its subject states, political squabbling among the Athenians hampered their military, and the Spartans, with wealth provided by the Persians, continued to apply pressure. Athens achieved its last significant victory in the war at the battle of Arginusae in 406, but even that triumph was marred by the execution of several Athenian generals for reportedly failing to recover and bury their dead. The following year, the Spartan commander Lysander crushed the Athenian fleet at the battle of Aegospotami. Sparta then cut off Athens' food imports and besieged the city by land, forcing it to surrender in 404.

Sparta spared Athens from utter destruction, though Corinth and other Spartan allies desired it. Under the conditions of surrender, Athens lost its overseas possessions, its Long Walls, and most of its fleet. The Delian League also dissolved. The Golden Age of Athens and its empire was over. Despite this conclusion, Sparta had difficulty exploiting its victory in the decades that followed. In this way, the Peloponnesian War only led to a longer period of wearing conflict among the Greek city-states.

Peloponnesian War, Second (431–404), Consequences

The Peloponnesian War ended in 404 when Athens accepted Spartan terms. Most of the immediate consequences of the treaty were predictable for both sides. Spartan success in the war initiated a 60-year period in which exploiting military success became a problem for every city-state that tried to dominate Greece, ultimately resulting in the end of politically independent Greek city-states.

Although some of Sparta's allies had sought the total destruction of Athens, the treaty was much more lenient, either because Sparta held the unlikely belief that Athens was a worthy city or because it actually feared the city that might benefit in the power vacuum caused by Athens' destruction (most likely Thebes or even Argos). The terms required

destruction of the walls around the city and the Piraeus harbor, the surrender of all but a dozen ships, and the recall of all exiles (most of whom were opponents of democracy). Not surprisingly, although it was not a term of the treaty, the Delian League dissolved, as it had been all but destroyed already by Lysander. As bad as these measures were, they applied only to Athens.

The other immediate impacts of the war were much more widespread, albeit more difficult to quantify. In addition to the battle deaths on both sides, an unknown number of men, women, and children died violently off the battlefield during the war. A number of city-states, including Melos and Delium, had been entirely destroyed or depopulated. The plague in Athens did not single out Athenians, but killed many non-Athenians as well. Agricultural production had suffered throughout much of the Greek mainland, causing additional economic, social, and medical problems. All of this meant an overall decline in the population in Greece that, although spread unevenly, affected all economic levels, free and slave. The nonagricultural economy also suffered in every aspect (except military-related), as the number of expensive ships and mercenaries employed by both sides increased over time. The loss was great, but within 10 years many city-states had rebounded noticeably and were ready for renewed fighting.

In the aftermath of the peace treaty with Athens, Lysander, still in control of the Spartan navy, tried to exploit the advantage and create a Spartan empire. He forced captured cities that had been part of the Athenian Empire to receive garrisons and a board of pro-Spartan political overseers (*decarchies*). In Athens, Lysander installed a garrison and a board of 30 pro-Spartan overseers that came to be called the Thirty Tyrants because of their excesses.

But Lysander and his supporters overreached, and the behavior of the Spartans fomented opposition among other city-states, including some allied members of the Peloponnesian League. The Spartans also irritated their former source of wealth, Persia, as they went back on the terms of their agreement with that kingdom. In return for the wealth Sparta received during the war, it had promised to give the Persian king control of the Greek city-states in western Asia Minor. Lysander initially rejected the agreement because he sought to maintain his own control over these cities.

The Athenians restored democracy in 403 and removed the garrison. Then, in 395, frustration with the Spartans led to the Corinthian War as

Corinth, Thebes, and Athens joined forces, with Persian funding and naval support, against Sparta. The war at sea went well, with Conon winning a major victory at Cnidus in 394. Conon then returned to Athens, where he led the restored democracy in rebuilding its walls and fleet and began to organize a new naval alliance called the Second Athenian Confederacy. The war only ended in 387/6 when the Persian king threw his money behind Sparta and imposed a peace treaty on Greece, often called the King's Peace.

Despite the peace treaty, conflict broke out repeatedly between Thebes and Sparta and led to the utter defeat of Sparta at the battle of Leuctra in 371. The outcome led to the end of the Peloponnesian League, as Thebes invaded Spartan territory several times and freed the Helots and Messenia. As Thebes grew powerful and started to create its own "empire," conflict arose between Athens and Thebes, culminating in 362 at the battle of Mantinea, where the Theban general Epaminondas was mortally wounded and Theban dominance began to wane. In the years that followed, Athens tried to dominate but had no better luck, facing opposition from Thebes and Persia that culminated in the collapse of the Second Athenian League.

By the mid-fourth century, the Greek city-states were financially and militarily exhausted. The political and military vacuum that had eventually resulted from the Peloponnesian War coincided with the emergence of Philip II as king of a resurgent Macedon in the north. In 338, the city-states of Greece succumbed to him, thus bringing the Classical Period of Greek history to an end and initiating an era of expansion under monarchs.

Peltast (*Peltastes*)

The peltast was a type of medium- or light-armed infantry soldier named for his wickerwork or wooden crescent-shaped shield, the *pelte*. In addition to this shield, which could be conveniently slung across the back via a strap, peltasts were typically equipped with javelins as their primary offensive weapons, though some might have had thrusting spears. Unarmored and equipped with a light shield, peltasts were relatively quick and were notoriously difficult for hoplites to grapple with on open ground. Though eventually peltasts could be found throughout the Greek world, they probably originated in and were closely linked to Thrace, and were often employed as foreign mercenaries in Greek armies to supplement heavy-armed hoplites. By the end of the fourth century, peltasts were a standard feature in many armies, especially those of the Macedonians.

Peltasts would have been familiar to those Greeks living close to Thrace from the Archaic Period, and were introduced to Athens in the mid-sixth century, probably by Peisistratus who relied upon mercenaries raised in Thrace as he fought to regain his position as tyrant of Athens. From this time, peltasts appear on Attic pottery, usually clothed with traditional Thracian garb, including distinctive boots and a patterned cloak. From the artistic evidence, there appear to have been two kinds of peltast, one armed with javelins and another with a thrusting spear. Despite this early introduction in Athens, peltasts only saw extensive service as mercenaries in Greek armies starting with the Second Peloponnesian War. In 425, the Athenians Cleon and Demosthenes used peltasts and other light troops recruited from cities in and near Thrace to defeat a force of Spartan hoplites trapped on the island of Sphacteria, lying near Pylos. The Spartan hoplites, the most fearsome fighters in the world, were unable to close with the mobile light troops arrayed against them. Consequently, the Spartans surrendered, and nearly 300 of them were taken to Athens as prisoners. This

battle demonstrated that light-armed troops, including peltasts, could be effective even against hoplites. Later in the war, a group of Thracian peltasts in the service of Athens massacred the entire population of the Boeotian town of Mycalessus. This horrifying event helped to solidify the negative image of peltasts held by most Greeks, especially those of the hoplite class. During the massacre, cavalry from Thebes arrived to drive the peltasts away, and the peltasts demonstrated their famed tactics by swarming against the horsemen in small detachments to hurl their javelins before falling back again. Peltasts could thus be effective against cavalry too.

After the Peloponnesian War, peltasts were part of the expedition of the Ten Thousand Greeks in the service of the Persian Cyrus the Younger, and fought at the battle of Cunaxa in 401. During this campaign, the Athenian Xenophon realized that peltasts could be well used if placed on high ground to rain down javelins on the enemy. In 390, at Lechaeum, mercenary peltasts under the command of the Athenian Iphicrates utterly defeated a division of 600 Spartan hoplites, perhaps the most renowned feat of any peltast force. Iphicrates was made so famous by this battle that some ancient sources wrongly credit him with inventing the peltast in the first place. Iphicrates, however, might have conceived of a new type of infantry soldier based in part on the peltast. In response to the challenge posed by peltasts, some Spartans, including Agesilaus II, devised novel tactics for hoplites, including ordering the youngest age groups of hoplites to charge out from the phalanx in an attempt to catch and kill the fast-moving peltasts. This tactic had some measure of success, since one-on-one a peltast was little match for a Spartan hoplite. More often than not, though, the peltasts used their speed and loose formations to avoid facing hoplites in hand-to-hand combat.

Despite some spectacular battlefield victories, and despite the extensive use of even Greek peltasts by those Greek cities lying closest to Thrace, peltasts failed to change the nature of Greek battle during the Classical Period. Hoplite phalanxes continued to be the most prominent element of Greek armies, and even great innovators such as Epaminondas of Thebes are known mainly for their new phalanx formations rather than their use of light troops. Philip of Macedon and his son, Alexander the Great, during the latter half of the fourth century, finally made peltast contingents an integral part of their battlefield formations and tactics. Some scholars think that the soldiers of the Macedonian phalanx were based on the variation of the peltast armed with the thrusting spear. The Macedonian heavy infantry was

equipped with a smaller and lighter shield than the traditional hoplite shield, and the sources often call the Macedonian shield a *pelte*. The Macedonian shield was also slung over the neck and shoulder with a strap, very much like the peltast's shield. However, the most obvious use of peltasts by the Macedonians was as a light infantry force usually placed on the wings, outside of the heavy cavalry, to protect the army's flanks. The mobility and speed of peltasts made them uniquely suited to exploiting high ground and rough terrain, which was often found at the edge of the battlefield, including, for example, at Issus in 333.

Perdiccas (d. ca. 320)

Born ca. 360, Perdiccas was the son of Orontes and possibly of royal descent. He occupied a prominent position in Alexander the Great's court, including serving as a *somatophylax* (bodyguard). He was a member of the Royal Hypaspists at the time of Philip II's assassination in 336, and was among those who pursued and killed his murderer. In the sources, Perdiccas is often linked to events that highlight the lack of discipline of his soldiers, but much of this negativity likely stemmed from Ptolemy I Soter's history; he and Perdiccas became serious rivals after Alexander's death.

After Hephaestion's death in 324, Perdiccas effectively became Alexander's second-in-command. He was one of the most influential

marshals when Alexander died, and he was said to have been given the king's signet ring just before his death. Perdiccas supported the right of Alexander's unborn child for the kingship, and was poised to seize sole regency before Philip III Arrhidaeus was put forward as another candidate. A compromise followed that limited Perdiccas' power, although he remained Chiliarch. Perdiccas set about eliminating rivals almost immediately, executing Meleager and having 300 of his supporters crushed to death by elephants. Perdiccas also had Alexander's wife Stateira and her sister murdered (so that they could not be used as political pawns), and annulled Alexander's last plans, to cancel Craterus' instructions to assume the regency of Macedonia. Seeking a strong alliance, he married Antipater's daughter Nicaea, but soon aimed higher and secretly courted Alexander's sister Cleopatra as well. Perdiccas was successful in campaigns to conquer Cappadocia with Eumenes of Cardia, which made the army well-disposed toward him for a time.

In 321/20 Perdiccas was facing confrontation with Antipater, Craterus, and Antigonus I Monophthalmus, who feared his growing power, but he turned his attentions instead to Egypt. Perdiccas had arranged Alexander's body to be transported to Macedonia in a magnificent funeral procession, through which Perdiccas hoped to be seen as Alexander's legitimate heir. Ptolemy intervened, however, and had the funeral procession and body stolen and brought to Egypt. This prompted Perdiccas to attempt to eliminate Ptolemy once and for all, however, the campaign was a disaster. In attempting to reach an island opposite Memphis, Perdiccas lost at least 2,000 men to the Nile (and to the crocodiles). Unwilling to suffer any longer under Perdiccas' leadership, his prominent generals, including Seleucus I Nicator and Peithon, stole into his tent and murdered him in the night.

Pergamum

Pergamum was a city situated on a towering hill on the north side of the broad Caicus valley in Mysia, northwestern Anatolia. It is first mentioned in historical sources by Xenophon, who says the town surrendered voluntarily to Thibron the Spartan in 399, but the city only rose to prominence in the Hellenistic Period, when it became the capital of the Attalid kingdom of Pergamum. After the death of Attalus III of Pergamum in 133, the city and kingdom of Pergamum briefly became the capital of the Roman province of Asia.

Lysimachus chose Pergamum as a secure treasury and appointed Philetaerus as the garrison commander. However, Philetaerus switched his allegiance to Seleucus I in 282, just before the downfall of his former master. At first, Pergamum was nominally under Seleucid rule but following his victories over the Galatians in the 230s, Attalus I of Pergamum declared himself king, thereafter pursuing a vigorous policy of resistance to Seleucid rule in Asia Minor. Pergamum was to become the heart of the Attalid kingdom which controlled much of Asia Minor. Attalus I of Pergamum allied himself with Rome against Philip V of Macedon during both the First and Second Macedonian Wars.

In 201, Philip V of Macedon besieged Pergamum and perhaps out of frustration at his inability to take such a well-fortified and well-defended city, resorted to impiously laying waste to the religious sanctuaries of the lower city. Pergamum was again besieged unsuccessfully in 192–191 by Seleucus, the son of Antiochus III the Great. Under Eumenes II of Pergamum, the city and kingdom of Pergamum once again allied with Rome—against Perseus during the Third Macedonian War. Between 156–154, Prusias II of Bithynia invaded Pergamene territory, and like Philip V of Macedon before him, resorted to despoiling the sacred places including the Nicephorium, without making any real attempt to take the city itself.

Pergamum was an excellent example of well thought out town planning, evolving and expanding over time. The palace and citadel occupied the top of the hill while other buildings were built in terraces on the slopes of the hill including a large and splendid theater. The citadel at Pergamum

contained arsenals and barracks; the city also boasted a magnificent library, regarded as being second only to the Great Library of Alexandria, and a museum. The city also housed the Great Altar of Zeus, the temple to Athena Nicephorus, and was also famous for its Sanctuary of Asclepius. At the height of its power Pergamum was one of the most beautiful, important, wealthy, and powerful of the cities of the Hellenistic World.

Periander (ca. 625–587)

Periander, tyrant of Corinth, son of Cypselus. Married Melissa, daughter of the tyrant of Epidaurus; they had two sons. Herodotus' portrayal of him varies: he is clever and manipulative, but also subject to the dysfunction of his family and an autocrat.

In Book 1 he is a friend of Thrasybulus, the tyrant of Miletus, and passes vital information to him to aid him against Alyattes of Lydia. He also is the dealer of justice to lying sailors in the story of Arion the singer, who threw himself overboard rather than be killed. Periander searched out the truth and punished the sailors.

In Book 3 he is said to have killed his wife, Melissa, causing a rift between himself and both his father-in-law and his youngest son, Lycophron, which resulted in him exiling his son to Corcyra (Corfu). When

he later offered to swap places so that Lycophron might rule Corinth, the Corcyraeans murdered Lycophron to avoid having Periander as tyrant. As punishment, Periander sent 300 eminent Corcyraean boys to be castrated by Alyattes in Sardis.

In Book 5, he heeded the advice of Thrasybulus and executed eminent Corinthian citizens to retain control of Corinth, and severely humiliated the women of Corinth by having their clothes stripped from them as they attended what they thought was a festival, as a sacrifice to his dead wife. This story is told in the context of examples of the villainy of tyrants.

Pericles (ca. 495–429)

Pericles, son of Xanthippus, was a prominent mid-fifth-century Athenian political and military leader who dominated Athenian politics from c. 443 until his death in 429. From a wealthy and prominent family (his father commanded the Athenians at Mycale and his mother, Agariste, was the niece of the great reformer Cleisthenes), Pericles chose the popular side of politics. He first appears in the 460s as (probably) a junior partner to Ephialtes in the successful attacks on the Areopagus and the prominent conservative Cimon. Most of the powers of the Areopagus were transferred to the courts and the *Boule* (Council of 500) and Cimon was exiled under the conflict-breaking mechanism of ostracism (461).

Following Ephialtes’ assassination, Pericles became the leading popular politician. He introduced one of the key planks of the Athenian democracy, state pay for service. The initial coverage, 6,000 jurors in the reconstructed court system (454), was over time expanded to around 20,000 citizens. In 451

Pericles sponsored a law restricting citizenship to those with two Athenian parents. This restricted the pool of those eligible for the increasing number of financial benefits to citizens but was also in part an antiaristocratic law—aristocrats not uncommonly married women from aristocratic families in other *poleis*. Both these measures resulted in enhanced influence for Pericles.

Pericles complemented this political activity with a successful campaign in the Corinthian Gulf (455), during the First Peloponnesian War (460/59–445). He followed this up in the 440s with campaigns to strengthen the Athenian Empire. He returned Delphi to Phocis and suppressed the revolts of Euboea and then Samos (440–439). A feature of his campaigns (although he did not originate the practice) was establishing cleruchies (military colonies) to extend Athenian control. He also established colonies in the west (at Thurii) and at Amphipolis in the Chalcidice.

This combination of popular control of political institutions, military success, and the tangible benefits of an expanded empire secured massive support. In 443, Pericles' main opponent, Thucydides son of Melesias (not the historian), was ostracized. From this point onward Pericles was reelected *strategos* every year and faced no serious internal political opposition until the end of his life. Thucydides (2.65.9) famously commented that “in what was in name a democracy, the rule was in fact in the hands of the first man.”

Marble bust of Pericles found at Tivoli, Italy, perhaps a copy of a fifth-century original by Cresilas. Pericles is wearing a Corinthian helmet as if prepared for battle (the helmet would be lowered just before action). However, because of his disproportionately long head, contemporary comedies call Pericles "squid head," and Plutarch suggests the helmet was to hide this. Located in the British Museum, London, United Kingdom. (Library of Congress)

Pericles' continued external focus from 443 to 431 was strengthening and expanding Athens' empire, and weakening Athens' main rival, Sparta. However, the pressure on Sparta was a major factor in the outbreak of the Second Peloponnesian War (431–404). By refusing the arbitration required under the Thirty Years Peace of 445, Sparta was legally responsible for the war. However, the pressure on Sparta's allies, and therefore Sparta's power and position, was immense and Pericles must have known that Sparta had little choice but to go to war. For example, in the years immediately

preceding the war, Athens had strengthened its position in the west and the Chalcidice, simultaneously weakening Corinth, by allying with Corcyra and besieging Potidaea. In 432, the Megarian decrees struck at another strategically located Spartan ally, Megara. If Sparta did not demonstrate that it could and would protect the members of the Peloponnesian League it is entirely possible that several would leave.

Pericles was apparently willing to run the risk of war because of Athens' very strong financial and naval position and his measures to strengthen Athens' general defense. These included improving the Long Walls, which effectively prevented Athens from total blockade except by a stronger naval power—which did not exist—and establishing an effective 1,000-strong cavalry. Pericles also had a strategy to resist the Spartans, almost certainly devised prior to the outbreak of war.

This so-called “island policy” called for Athens to avoid major land clashes with Sparta, protect the empire at all costs, and feed the city with imported food. As long as Athens had naval supremacy and the empire, the Long Walls to the Piraeus meant Sparta could not starve the city out. Complementing this was a limited, cavalry-based, protection of Athens' *chora* (agricultural land), and amphibious raids on the Peloponnese. The latter were designed to appease public disquiet at the Peloponnesian ravaging of Attica and to maintain pressure on Sparta's allies.

This plan cleverly exploited Athenian strengths and Spartan weaknesses. The criticism that this was essentially a defensive policy that could avoid losing the war but could not win it overlooks the real victory requirements for Athens. Athens needed only to realize the aims of the prewar pressure to detach Spartan allies from the Peloponnesian League, neutralizing it (and Sparta) as the dominant military alliance in Greece. To achieve this, Athens needed to demonstrate that Sparta could not protect its allies and that the allies were better off either neutral or aligned with Athens. This did not require an Athenian military victory. If Sparta was unable to achieve a decisive victory and made peace essentially on the basis of the prewar status quo, Athens would emerge stronger relative to Sparta than it was in 431.

However, when the Athenians saw their *chora* being ravaged without a full military response and were struck (430) by plague, the level of discontent considerably reduced Pericles' popularity and he was tried and fined. Nevertheless, he was reelected *strategos* for 429/8 but died from the effects of the plague (which had earlier killed his son) that same year.

Pericles' strategy to win the Peloponnesian War could arguably have done so had he lived to maintain control. A great statesman and leader, Pericles brought Athens to the height of its power and glory, while helping unleash the war that led to its decline. He is supposed to have stated on his death bed (with some inaccuracy) that his proudest legacy was that "no living Athenian ever put on a black *himation* (mourning dress) on my account" (Plutarch, *Pericles*, 38.4).

Perioikoi

Perioikoi (meaning "those dwelling round about") was the term used in ancient Greece for dependent communities that were part of a larger state. Although they existed elsewhere (for example, Achaea Phthiotis seems to have been in this relationship with Thessaly) the term *Perioikoi* was particularly applied to the *poleis* subordinate to Sparta, the central *polis* of the Spartiates. Together with the Spartiates, they made up the state known to the Greeks as the *Lakedaimonioi*, that is, the people of the region Lacedaemon (which modern historians usually call Sparta).

There were *poleis* of the *Perioikoi* in both Laconia and Messenia. They each included free citizens and historically they had escaped the subjugation by conquest that had happened in early times to the Helot population. *Perioikoi* seem to have administered their internal affairs but had no part in the governing of the Spartan state. They provided hoplites and cavalry in time of war. At the time of the battle of Plataea (479), they may have fought in separate units from the Spartiates (Herodotus 9.28). Later, they fought alongside them in the same ranks (Thucydides 5.67). In any case, hoplites from the *Perioikoi* were plainly fit and proficient enough to make up a composite army with the Spartiates. Ancient sources do not distinguish Spartiates and *Perioikoi* in describing Spartan forces. An exception is the Sciritae, a regiment which was recruited from *Perioikoi* on the north border of Laconia and which had the distinction of being stationed on the left wing of a Spartan army (Thucydides 5.67).

Little is known about the social structure of the *Perioikoi* but it is highly likely from some indications, such as Herodotus 7.234 and Xenophon, *Hellenica* 5.3.9, that *Perioikoi* had Helots of their own, so that their *poleis* were in some sense miniature Spartas. In the Messenian uprising of ca. 465–456 (Third Messenian War), some *Perioikoi* in Messenia joined the rebel Helots (Thucydides 1.101). In the Boeotian invasion of Laconia and Messenia in 370/69, many *Perioikoi* joined the invaders. Some rebel *Perioikoi* in northern Laconia were then incorporated into the new foundation of Megalopolis but the rest of those in Laconia did not maintain their independence after the invaders left. *Perioikoi* were still part of Sparta in the reign of King Cleomenes III (235–222), who recruited 4,000 suitable individuals from them into the expanded body of Spartiate citizens (Plutarch, *Cleomenes* 11). After the incorporation of Sparta into the Achaean League in 195, the *Perioikoi* became free states separated from Sparta.

Perseus of Macedon (d. ca. 165)

Perseus was the last king of Macedon, reigning from 179 to 168. He was the eldest son of King Philip V of Macedon and Polycratia of Argos, although rumor had it that he was an illegitimate son of Philip and a seamstress named Gnathaenion.

During the Second Macedonian War, Philip sent the 12- or 13-year-old Perseus with some of his retainers to occupy the passes of Pelagonia. In his late teens, Perseus fought on the Roman side in the war against Antiochus III. He and his younger brother Demetrius, who had been a hostage in Rome between 196 and 190, became estranged in the mid-180s. This was allegedly because Demetrius was treated with extraordinary favor by the Romans, while Perseus inherited his father’s hatred of Rome. In 182, Perseus accused Demetrius of trying to assassinate him. In 181, Perseus used Didas, Philip’s governor of Paeonia, to extract incriminating information from Demetrius regarding his future plans and relations with Rome. The plan worked, and Perseus convinced Philip to have Demetrius executed in 180.

Perseus succeeded his father in 179, renewed his friendship with Rome, defended Macedon against the Bastarnae and the Thracians, and granted amnesty to Macedonian debtors and exiles. He launched a charm offensive toward the Greek states, including the Achaean and Aetolian Leagues and Boeotia, increased his influence with the Amphictyonic council (which managed the sacred site of Delphi), married Laodice II, daughter of Seleucus IV of Syria, and gave his sister Apame in marriage to Prusias II of Bithynia. Eumenes II of Pergamum put the worst possible construction on these activities before the Romans, in addition to accusing Perseus of stockpiling weapons and money in preparation for a war against Rome. Rome declared war in 171 and after some initial success, Perseus was defeated at the battle of Pydna in 168. He was captured and displayed in the triumph of his

conqueror Lucius Aemilius Paullus, after which he was interned at Alba Fucens and died around 165 (or possibly 162). It is reported that he either starved himself to death, or was killed by his jailers who deprived him of sleep.

Persian (Achaemenid) Empire

In 550, Cyrus defeated the Median king Astyages and inaugurated the formation of the Achaemenid Empire. At its peak (around 500, see map) the king's sway stretched from northern Greece to the Indus valley, Sudan to Central Asia, and the Indian Ocean to the Caucasus. Even at the start of Darius III's reign (just before its demise) the only certain difference is that the northwest frontier was the Anatolian coast. The lack of appropriate source-material makes identification of the other frontiers difficult—an abiding problem of Achaemenid historiography is that evidence is skewed to the empire's center and west. Royal inscriptions described the empire in lists of up to 31 *dahyava* (lands/peoples) of whom the king said "I reigned over them, they brought me tribute, what I said to them, they did, my law held them." Herodotus listed some 65 nations arranged in 20 tribute-districts—not an authentic document, but capturing a truth in its focus on tribute: resource-extraction as a symbol of power and means of enriching king, court, and imperial elite was a central characteristic.

Formed in just over a generation, the empire met its end in a limited sense (replacement of its Persian ruler by a Macedonian) in just four years (334–330) and in a more substantial sense after Alexander the Great's death with its division into separate kingdoms. The era of formation and

expansion ended with Xerxes' failure in Greece (480–479), but the following 150 years saw some recovery of consequent losses (the Persian claim to Anatolia was reaffirmed by the King's Peace of 387/6), and the empire remained the defining geopolitical fact for the east Mediterranean and western Asia—a situation that showed little sign of ending. Alexander's achievement was a shockingly improbable realization of the aspirations of Greek panhellenists.

The era of postexpansion stability was not devoid of conflict. Both before and after conquest of new territory ceased there were wars of succession (522–521, 424–423, 401), native insurrections of varying duration (Lydia: immediately postconquest; Babylonia, Elam, Media: 522–521; Greek Anatolia: 499–493, 479–386; Cyprus: 499–496, early 340s; Egypt 486–485, 460–454, 404–343; Babylonia: 484, Media: 409; Paphlagonia: early fourth century; Phoenicia: early 340s) and trouble caused by disaffected satraps: Oroetes (ca. 522–520), Aryandes (late sixth century), Masistes (479/8), Megabyzus and his son Artyphius (mid-fifth century), Pissuthnes and his son Amorges (late 420s–412), Terituchmes (reign of Darius II), and Ariobarzanes, Mausolus, Autophradates, Orontes, Datames and Artabazus—six participants in the so-called satraps' revolt of the 370s–350s. There were also structural sources of recurrent disorder—notably the Mysians and Pisidians of western Anatolia, the Carduchians of southeastern Anatolia and the Cadusians of the west Caspian region, people who were never more than semi-attached to the empire, even though located within or immediately adjacent to it. Exercise of central control was discontinuous and divergent in type. The empire was not neatly divided into uniform provinces governed by satraps: even areas such as Caria, Lycia, or Cilicia could be for long periods rather marginal to such a system.

What kept it together? Royal inscriptions and iconography stressed peace and harmony: this was not an ideologically militarist empire even initially (despite a Greek perception to the contrary). It also did not generally practice cultural imperialism. The Persians had no desire to “persify” the world, merely to extract its resources for their own benefit. Much of the time collusion from local elites (who could also benefit) helped maintain stability, and exploitation of existing bureaucratic processes fostered continuity. Where control was lost for long periods this was generally influenced by geographical factors. For example, the comparative difficulty of invading the Nile valley across Sinai or through the Delta

helped the Egyptians in 404–343. A mismatch between the physical boundary of Asia Minor and the ethnocultural boundary between non-Greek and Greek combined with the emergence of imperial powers in Aegean Greece created a special situation in Greek Anatolia in 479–386 (only finally resolved by playing those powers off against one another).

Painting of a scene from the "Alexander Sarcophagus," late fourth century, Sidon. The scene depicts combat between Persians and Macedonians during Alexander the Great's conquest of the Achaemenid Empire. The depiction of the Persians as lightly equipped, with bows or the light *pelte* shield and (now missing) spears or javelins, is consistent with literary descriptions of late Achaemenid troops. The sarcophagus is located in the Archaeological Museum, Istanbul, Turkey. (Bridgeman Images)

In the end imperial control entailed that subjects either experienced or feared superior military force. Even the King's Peace finesse, for example, depended on the threat of military intervention. In tactical/weaponry terms this force came from a mixture of Iranian (Persian and non-Persian) and non-Iranian troops. The historian's problem is deciding the proportions and precise identities of these categories in any given context. Herodotus' description of Xerxes' army is a product of ethnographical information-gathering and cannot be taken seriously; few other major armies are systematically described, and smaller forces are rarely categorically itemized at all. Large-scale expeditionary armies were probably in practice

dominated by Iranians and an elite Persian core. But it is harder to figure out what was locally available in provincial regions, especially in the empire's western half. Satraps maintained forces of Iranian cavalry, but the incidence of Iranian infantry is rather less clear. Soldiers are hard to identify in documentary sources (admittedly the archives we possess are rarely well-suited to the task), and Xenophon's generic statements about the garrisoned landscape are hard to validate: in fact, it is hard to know how occupied the landscape seemed away from major centers and roads. Mercenaries appear quite often (not only in the heyday of Greek mercenary employment from the later fifth century), and one suspects that non-Iranians/Persians—whether paid as mercenaries or levied as subjects—were a majority among troops available for immediate response. That is why serious provincial disorder was apt to require intervention from outside. The frequency with which local forces successfully controlled low-level disorder that might otherwise have turned into something serious is something we cannot assess.

Persian Wars (490–479), Causes

The basic cause of the Persian Wars was the desire of the Persian Great King to ensure control of the western extremity of his empire, and then to expand

it further west. Although the expansion into Thrace did bring natural resources such as timber and gold into the empire, Greece proper was hardly known for its riches. Possessing Greece would have brought slaves, tribute, and taxes, but the Greeks themselves did not believe that the Persians were motivated by wealth (QQ 31).

The issue of control was real. Persian acquisition of Croesus' Lydian Empire brought numerous Greek settlements in coastal Asia Minor into the empire. The Persians tried a variety of control measures, including setting up pro-Persian tyrants in many cities. However, the Ionian Revolt of 499–493 highlighted the cross-border “Greek problem.” The revolt was relatively widespread and in some areas difficult to suppress—the Greek naval campaign was troublesome and Persian victory at the battle of Lade in 494 was not a foregone conclusion. The rebel appeal to Sparta, although unsuccessful, and the military assistance provided by two Greek cities, Athens and Eretria, illustrated the nature of the problem. As long as Greece proper remained independent, their support for the Greek cities under Persian domination was a constant threat. This, rather than a desire to punish Athens and Eretria, was probably the motive behind the first expeditions against Greece. Although the aims of the Persian campaign which culminated at Marathon in 490 are uncertain, there was probably more to it than a punitive expedition. Athens and Eretria were the main targets, but it seems likely that the Persians were testing the waters, and that if they had won at Marathon they may have established a permanent presence, or at least accepted the submission of other Greek states.

This motive was probably even more prominent in the invasion of 480–479. The original motives remained, but Xerxes was clearly keen to restore the prestige lost by Darius with the defeat at Marathon. Although in the context of the empire Marathon was a minor setback in a frontier area, it had reinforced Greek independence and the possibility of support to their compatriots in Asia Minor.

Persian Wars (490–479), Course

Although it is possible to argue that the Persian Wars did not really end until around 449/8 whether by a formal peace (the Peace of Callias) or a de facto cessation of hostilities, the Persian Wars are traditionally regarded as comprising the Marathon campaign of 490 (the First Persian War) and the campaign of 480–479 (the Second Persian War). This view dates back as least as early as Thucydides, who describes (1.23.1) the war as “coming to a speedy end through two sea and two land battles.” However, which battles he meant is not entirely clear as the 480–79 campaign had five battles. If, as seems likely, he regarded Mycale as part of the follow-up action rather than of the war to defend mainland Greece, these battles were Artemisium, Salamis, Thermopylae, and Plataea.

Both campaigns were preceded by preliminary operations to secure the Persian route to Greece. Darius I had secured large areas of Thrace ca. 512 but control had to be reestablished after the Ionian Revolt (499–493). From 492 to 491, Mardonius secured territory from the Thracian Chersonese to Macedon, including Thasos and the Chalcidice. However, the Persians could not control the weather and their first attempt against Greece, an amphibious operation in 492, failed when most of the fleet was lost in a storm off Mount Athos in the Chalcidice.

In 491, the Persians sent envoys to demand earth and water as a sign of submission from the Greeks. Athens and Sparta refused (killing the envoys) but other states complied. These were mainly Aegean island states (which were more vulnerable to Persian attack) but included some mainland ones. A notable submission was the island of Aegina, strategically located off the Athenian coast. However, an Athenian appeal to Sparta neutralized this threat—Cleomenes I, despite the opposition of his fellow king Demaratus, took hostages and forced Aegina to remain quiet.

In 490, probably because of the disaster at Athos in 492, the Persians launched their next attack across the Aegean. Under Datis and Artaphernes a Persian fleet with perhaps around 25,000 troops, securing the islands of the Cyclades (including Naxos) en route, arrived on Euboea. It took Carystus and then besieged Eretria. After six days Eretria was betrayed, its temples burnt in revenge for the destruction of Sardis in the Ionian Revolt, and the population enslaved and deported. The Persians, advised by Hippias, the exiled Athenian tyrant, then landed unopposed at Marathon. This was easier than an opposed landing at Phalerum, avoided the potential for delays and/or shipwreck traveling around Sunium, and was good terrain for their cavalry. Hippias had recommended Marathon, perhaps because he also hoped for local support there. Reinforced only by the Plataeans, the Athenians deployed northeast to prevent the Persian army advancing on Athens. In the ensuing battle, the Greeks, around 10,000 strong, defeated the much larger Persian force. The surviving Persians, after a failed attempt to get to Athens by sea before the Athenian army returned, sailed home.

The Marathon campaign demonstrated the clear superiority of the Greek hoplite over Persian infantry, and the difficulties faced by Persia in conducting a campaign in Greece. These difficulties included the terrain, which was not suited to the Persian cavalry, and the extended supply lines. Worryingly for the Greeks, though, the campaign also demonstrated that many Greek states were not prepared to resist a Persian attack.

Although the Persians clearly regarded Marathon as a temporary setback, they did not return for 10 years. The main reason for the delay was a revolt in Egypt and Babylon and the death of Darius in 486. It took some time for his successor, Xerxes, to firmly establish his rule and to suppress the revolts. In addition, when he was ready to renew hostilities, the scale of the preparations, at least as recorded by Herodotus, were so vast that it took considerable time to organize. In 483, for example, the Persians began digging a canal across the neck of the Athos Peninsula to avoid a repeat of the storm losses in 492.

In the meantime, the Greeks were not idle. At Athens a series of ostracisms removed politicians suspected of Persian sympathies and, more importantly, a new fleet of 200 triremes was constructed. As the Persian preparations became more advanced, and better known to the Greeks, the Hellenic League was formed to resist the Persians. Their preliminary agreement was confirmed at the Isthmus of Corinth in 481. Thirty-one states

swore to resist and to punish medizers (Greek states who joined the enemy), agreed to end all wars and feuds between them, to seek support from Crete, Corcyra, and Sicily, send spies to Persia, and that Sparta would command the coalition land and naval forces. This was an important agreement, although the number of states involved was a clear minority of Greek states. Both Argos and Syracuse refused to join unless they were given shared command with Sparta, which was refused. Corcyra ultimately sent assistance, but so slowly it took no part in the war, and Crete remained neutral. In several cases, these states were encouraged not to fight because of oracles delivered (or claimed to have been delivered) by Delphi.

Athens, which provided as many ships as all the other Greeks put together, made a considerable sacrifice in giving naval command to Sparta, and also ended its war with Aegina. Sparta, on the other hand, also made sacrifices by supporting the new Hellenic League instead of insisting that the war be fought under its existing Peloponnesian League.

According to Herodotus, whose figures are regularly and clearly exaggerated, the Persian forces had around 500,000 fighting men and 1,207 warships. In 480 these advanced in parallel, the army so large Herodotus claimed it drank rivers dry and stripped the countryside of food. Whatever the size of the force, the preparations were unprecedented in Greek experience—the Persians even constructed a temporary bridge across the Dardanelles for the army to cross. The fleet was an important supporting element, both in terms of food supply and to neutralize the Greek fleet, but the emphasis was clearly on a land victory and permanent conquest.

As the Persians moved south, overawed Greek states in their path generally simply surrendered and joined them. The first Greek counter move inevitably mirrored the Persian advance—a joint land and naval response. A force of 10,000 men was deployed by sea to block the pass at Tempe (north of Thessaly). However, the fleet found no suitable anchorages and the army discovered there were three passes—too many to guard. The only sensible decision was to withdraw, but this resulted in the now unprotected states south of Tempe, including Thessaly, joining the Persians. This deprived the Greeks of their main source of cavalry.

The next line of defense saw 7,000 troops deployed to Thermopylae and 271 triremes at neighboring Artemisium. This confirmed the Greek strategy—a combined land and sea defense, located at narrow points which would negate the Persian numerical superiority. The defense initially went well,

with 200 Persian ships lost in a storm and the army inflicting serious casualties on the Persians in the narrow pass at Thermopylae. When the pass was turned part of the army escaped, the Spartans and Thespians fought to the death, while (according to Herodotus) the Thebans surrendered. The fleet had no choice but to withdraw. The next natural line of defense was the Isthmus of Corinth, which meant every Greek state north of it was exposed. Boeotia (except for Plataea) and many other states defected to Persia; the Athenians evacuated their city, preparing to fight at sea.

Although some were buoyed by the heroic defense at Thermopylae and encouraged by the performance of the fleet at Artemisium, many had given up—this was the crisis point for Greece. The Peloponnesians busied themselves fortifying the Isthmus and were reluctant to operate north of it. The Persians sacked Athens and the Greeks debated withdrawing their fleet from Salamis. Fortunately for them, they decided to stay and fight a naval battle (although Herodotus records that the Athenian Themistocles maneuvered his reluctant allies into it). The resounding Greek victory was a major blow for Xerxes who withdrew, leaving Mardonius and a still sizeable army to finish the task. Mardonius withdrew to Thebes for the winter, leaving a devastated Attica behind and the Peloponnesians still reluctant to move north.

While the fleet followed up the Persians to ensure their navy posed no threat, the Peloponnesians remained idle. Finally, under considerable pressure from Athens and Corinth, the Spartans led the Peloponnesian League forces north. At Plataea, still outnumbered, the Greek hoplite again proved superior to the Persians. Mardonius was defeated and killed, his army destroyed and the land threat to Greece was ended. The survivors suffered considerably on the retreat and most of them did not return home. About the same time as Plataea (traditionally on the same day, but this is unlikely) the Greek fleet won a major victory over the Persian fleet and accompanying army at Mycale, on the coast of Asia Minor. This effectively ended the Persian threat to mainland Greece and from this point onward the Greeks undertook operations against Persian possessions in Thrace, the Hellespont, the Aegean islands, and even Asia Minor.

Persian Wars (490–479), Consequences

The main effect of the Persian Wars was to permanently change the balance of power in both Greece and the Aegean. In Greece proper, although Sparta was confirmed as the preeminent land power, Athens became much more important. Athens' reputation was significantly enhanced by Marathon, and by its performance and sacrifice in the 480–479 campaign. In addition, Athenian vigor in pressing the postwar fight home against Persia in Thrace, the Hellespont, the Aegean islands, and even Asia Minor, contrasted with Sparta's reluctance. This, and the poor behavior of Pausanias, led to Athens' assuming leadership of those Greeks who wanted to take the fight to Persia, or who wanted freedom from Persia. Athens was now the preeminent Greek naval power. The foundation of the Delian League formalized Athens' position and the League's transition into an empire ultimately led to Athens seriously challenging Sparta's position in Greece.

The war also affected other Greek states to varying degrees. Punitive expeditions were sent against Boeotia and (less successfully) Thessaly. While the reputations of Sparta and particularly Athens were enhanced, Thebes was never allowed to forget it medized—it was a constant reproach thrown in its face by its enemies.

In general, the wars also caused the Greeks to redefine themselves. It heightened the idea of the difference between Hellenes and *barbaroi*

(“barbarians”—those who did not speak Greek) and increased Greek confidence and identity. Military superiority had been established, and the Greeks saw the result in terms of the victory of spear over bow, of freemen over slaves.

For the Persians, the wars meant abandoning any attempt to expand the empire westward. Persia continued to influence Greek affairs, but it was now through bribery and the threat of military force. At the same time, the Persians compensated for their deficiency in heavy infantry by hiring Greek hoplites as mercenaries. Territorially, the Persians were expelled from Europe, losing their considerable possessions in Macedonia and Thrace and also suffered losses in Anatolia in Asia Minor. The independence of Greek cities in Asia Minor became a real possibility, although not fully realized until Alexander the Great. Although Xerxes survived for a while, his failure in Greece appears to have weakened him. When the last Persian attempt to exert direct military influence failed at Eurymedon ca. 468, Xerxes was assassinated.

Peucestas (Active ca. 325–316)

Born ca. 350, Peucestas was an officer in Alexander the Great’s army. He

distinguished himself by saving Alexander's life during the Mallian campaign. For this he was made an eighth *somatophylax* (bodyguard), even though traditionally there were only seven in this position. He was awarded the satrapy of Persis in 324, and was notably one of the few Macedonians who adopted Persian dress. He even learnt the Persian language, and is said to have been the only prominent member of Alexander's court who did so. In the poisoning rumors that followed Alexander's death, Peucestas was implicated in the conspiracy, and appears to have been present at the drinking party where Alexander became ill.

His time as satrap in Persis made him very popular in the east, and he led an army against Peithon in 317 to prevent him from gaining the upper satrapies. Eumenes of Cardia attempted to bring Peucestas and his army under his own control, which led to hostility and the eventual compromise of a joint command. When Antigonus I Monophthalmus attempted to intimidate Peucestas into compliance by threatening to remove his satrapy, Peucestas accepted an alliance with Eumenes in earnest. This again devolved into a power-struggle over their forces, each attempting to undermine the other. After their defeat at Gabiene (316), Peucestas defected to Antigonus. He lost his satrapy but retained his life, unlike many of the other officers. It is unknown what happened to Peucestas, but he may have remained in Antigonus' entourage and later at the court of Demetrius I Poliorcetes.

Phalaecus (Active 350)

Phalaecus, son of Onomarchus, was the last Phocian general in the Third

Sacred War. While still young, he succeeded his uncle Phayllus in command in 351, at first with a veteran general, Mnaseas, as co-commander; but Mnaseas was soon killed in battle. Phalaecus was defeated in a cavalry battle near Chaeronea, and the Boeotians ravaged much of Phocis. Deposed from office for his role in looting the treasures at Delphi, he regained command in 346. Later that year, as Philip II of Macedon prepared to end the war, Phalaecus abandoned the Phocians to their fate and took his mercenaries to the Peloponnese. After an abortive attempt to campaign in Italy, he took a job fighting for Knossos in Crete. He died besieging Cydonia, possibly trying to save a siege tower which had been struck by lightning—a punishment, some said, for his earlier impiety.

Phalanx

The phalanx was an ordered formation of heavily armed infantry drawn up in ranks and files. It played an important, and often central, role in Greek land warfare from the seventh century (and perhaps earlier) down to the second century.

Archaic Period (ca. 700–480)

The ancient Greeks used massed infantry formations from the beginning of the Archaic Period, if not earlier. In the *Iliad* (4.297–300), Homer describes a Greek formation with the strongest men in the front and rear ranks. This is echoed in Xenophon's description (*Cyropaedia* 6.3.25) of hoplite formations of the later Classical Period with officers positioned in their front and rear ranks. Homer's *Odyssey* (9.54) may refer to ordered battle lines—further indicating that such formations were known to him. These also seem to have existed in the Second Messenian War. In Fragment 11, Tyrtaeus, a contemporary writer, details how contingents of light troops were

positioned beside formations of heavy infantry. This is supported by the detail in Pausanias' much later account (second century CE). It therefore seems that by the seventh century at least, some sort of massed formation was known to the Greeks.

During the Archaic Period, hoplites carried two shafted weapons—a javelin and a thrusting spear. The seventh-century poet Callinus (fr. 1.5) extols a warrior, as he dies, “to hurl his javelin one last time.” The use of javelins within a massed formation required the men to be separated by an interval large enough for them to effectively use such a weapon. This would suggest that the men were in the so-called intermediate-order spacing of at least 90 cm (3 feet) per man (see below). The use of thrown spears/javelins as a method of battle is a common theme throughout Homer's *Iliad*. However, in the poetry of Tyrtaeus none of the troops throw javelins at an enemy. This may indicate a change in methods of fighting between the time of Homer and that of Tyrtaeus and/or reflect regional differences in fighting style.

Tyrtaeus and Homer also describe Archaic Period shield-walls. In the *Iliad* (13.131), Homer describes a Greek formation awaiting the Trojan advance with “shield pressed against shield, helmet by helmet, man by man.” The Spartan poet Tyrtaeus (11—QQ 57) also describes a formation of men ready to engage, “setting foot beside foot, resting shield against shield, crest beside crest, helmet beside helmet.” Such terminology clearly describes the close-order formation common to the Classical Period where each man occupied a space of 45–50 cm (around 1 foot 6 inches) while his shield overlapped with the man on his left, creating a shield wall (see first illustration).

Detail of the North Frieze of the Siphnian Treasury, Delphi, ca. 525, depicting the battle between the gods and the giants. Although a mythical scene, the giants are depicted as hoplites and those on the right are in phalanx formation. The fleeing hoplite in the middle has lost or broken his spear and holds his sword; the *porpax* or central armband of his shield is clearly depicted. Located in the Archaeological Museum, Delphi, Greece. (De Agostini Picture Library/G. Nimatallah/Bridgeman Images)

It is not known if variants of these basic depths and structures were used in the Archaic Period, if different city-states adopted different formations, or even if different shaped formations were employed. Tyrtaeus attests to Archaic Period battle lines arranged with light troops positioned on the wings and Pausanias supplies the additional detail that they could be behind the phalanx or sometimes in the center of the line with contingents of hoplites on either side. However, although our tactical knowledge of the employment of such formations is very limited, what these descriptions do show is that the Archaic phalanx was vulnerable on its flanks. Pausanias, a very late source, records that at the battle of Ithôme, Messenian light troops moved onto the wings and attacked the Laconian hoplite formations in the flank, eventually causing them to rout. The Laconians had positioned their light troops in the center and their hoplites on the wings and this left the side of their infantry formation dangerously exposed.

These accounts indicate that in terms of tactical thinking warfare in the Archaic Period was not rudimentary. As with the deployment of massed formations in later periods, the disposition of troops and formations in the Archaic Period followed a process of tactical decision-making by those in

command who determined how troops were to be arranged for battle. Warfare in Archaic Greece was not merely a process of facing an opponent and relying on skill, resolve and luck. By the Archaic Period, the fundamentals of tactical thought were in place—undoubtedly aided by the organization of the phalanx into units and sub-units. This allowed for better command and control of troops on the battlefield and for the formulation of more complex ideas for the conduct of war. Possibly because of these tactical applications, and despite its inherent vulnerabilities, nearly every Greek state adopted the hoplite phalanx during the Archaic Period. The phalanx remained relatively unchanged from its beginnings in the Archaic Period until the mid-fourth century when the fighting style of the Greek hoplite was superseded by the rise of the Macedonian phalangite.

Classical Period (ca. 480–323)

During the Classical Period the phalanx developed further. The vulnerable flanks were better, and more regularly, protected by light troops or cavalry, and formations of various shapes were employed to meet tactical requirements. It is uncertain when the Classical hoplite phalanx as it is currently understood came into being. It has been suggested that it was created by Pheidon of Argos for the battle of Hysiae ca. 669. However, Pausanias, the only reference to this engagement, makes no mention of the creation of the phalanx, and the literary evidence suggests that the Greeks had been using massed infantry formations much earlier. The Classical phalanx seems to be a refinement of an element of ancient Greek military organization that had been used for more than a century before the battle of Hysiae.

Although the organization of the Spartan army is notoriously uncertain, Thucydides (5.66–68) describes the Spartan command chain, but not the army's structure, at the battle of Mantinea in 418. However, when combined with other sources, this suggests the following composite structure. The army was divided into seven divisions (*morai*), each under the command of a *polemarchos*. Each *mora* was subdivided into four companies known as a *lochos*, each commanded by a *lochagos*. Each company was further divided into a number of platoon-sized units called an *enomotia* led by an *enomotarchos*. A row of officers, each known as an *ouragos*, was positioned as the rear rank of the unit. At Mantinea, most Spartan *enomotiae* were deployed in four files of eight—although Thucydides notes that each

enomotarchos could decide on the depth of his *enomotia*. Xenophon (*Lacedaemonian Politeia* 11.4) additionally states that the *enomotia* could also be deployed two (? the text is corrupt at this point), three, or six men abreast. When four *enomotiae* were combined, they formed a tactical and administrative unit known as a *pentykostys* commanded by a *penteconteros*.

Other city-states followed their own ideas about the arrangement and deployment of their armies. *Athenaion Politeia* 21.1–22.2 states that the Athenian hoplite force consisted of 10 contingents, each drawn from one of the 10 Athenian tribes, and each commanded by a taxiarch. In Boeotia, 11 boeotarchs were elected from across a confederacy of Boeotian city-states to command various divisions of the army each containing 1,000 hoplites and 100 cavalry supplied by the various states on a *pro rata* basis. How the armies of many of the other city-states of ancient Greece were organized is far from certain.

The “block” phalanx was probably the most commonly used hoplite battle formation as it made it easier for an army marching in column to redeploy into a battle-line. Xenophon (*Lacedaemonian Politeia* 11.8) describes a marching *lochos* as arranged with each *enomotia* following one behind the other. When moving into line, the column would halt and the second *enomotia* would move forward and take up a position to the left of the unit before it. The third and fourth *enomotiae* would follow behind and then they too would redeploy to the left of the unit ahead of it until the entire formation was deployed. The structure of the phalanx into sub-units suggests that the Classical Greek phalanx did not fight as one continuous solid line of men. Rather it is more likely that the phalanx was made up of smaller discrete “combat groups” acting in concert with each other.

The common depth of the file in the Classical Greek phalanx was eight men—although there are references to formations as shallow as a single rank (the Spartans at Dipaea ca. 471), 25 deep (the Thebans at Delium in 424) and 50 deep (the Thebans at Leuctra in 371). Both Thucydides (4.93) and Xenophon (*Lacedaemonian Politeia* 11.6) state that the depth of the line could be adjusted to either deep or shallow depending upon the orders given and the way the line was formed when the army was deployed. Thus it seems that the depth of deployment was a decision made by the contingent commanders depending upon the terrain of the battlefield and the tactical requirements of the situation.

As well as different depths, the phalanx could be deployed with varying

orders of interval between each man. Asclepiodotus states that infantry formations could be deployed in one of three orders: a close-order, with interlocked shields, separated by about 45 cm (1 foot 6 inches) on each side; an intermediate-order with each man separated by about 90 cm (3 feet) on all sides; and an open-order with each man separated by about 180 cm (6 feet) by width and depth. These intervals, although outlined for the armies of the Hellenistic Age, may hold as true for the hoplite phalanx of the Classical Period as they do for the later formations of phalangites.

A modern reconstruction of a section of a Macedonian phalanx. It depicts the first five ranks lowering their *sarissae* (long spears), ready to engage while the remainder keep their weapons upright for ease of maneuver and to protect against missiles. In action, the phalanx would have had units on either side protecting its flanks. (Look and Learn/Bridgeman Images)

The close-order shield wall was used both offensively and defensively—although any advance made in close-order could only be done slowly, and perhaps (certainly for Sparta) with the aid of a sung cadence and/or music to maintain the integrity of the line (see illustration in “Chigi Vase” entry). The intermediate-order interval, on the other hand, facilitated the movement of the formation and charges or sallies would have been made by hoplites arranged in this intermediate order. Arranged in an intermediate-order, the rims of each adjacent shield just touched—providing the hoplite

with an easy way of determining whether he was maintaining his position. However, the intermediate-order phalanx, while more maneuverable than the close-order formation, lacked the defensive advantage of the interlocking shield-wall. The more spacious open-order interval was generally only used when an army was on the march rather than as a battlefield deployment.

Deploying with different intervals also created other tactical advantages for the phalanx. Because of the length and point of balance of the hoplite spear, the weapons held by both the first two ranks of a close-order formation projected well forward of the line, and could reach an enemy. Furthermore, the smaller interval of the close-order formation meant the weapons projecting ahead of the phalanx were laterally separated by only 45–50 cm (around 1 foot 6 inches). Troops arrayed in intermediate-order, conversely, only presented the weapons carried by the front rank to an enemy and these weapons were separated by around 90 cm (3 feet). This difference in offensive and defensive capabilities made the close-order shield-wall a formidable formation. In every account of a battle involving one side in close-order fighting against one in intermediate-order (or even cavalry), the side deployed in close-order is victorious.

Yet the phalanx did have its drawbacks. Once on the move, the phalanx was difficult to maneuver except by well-drilled troops or by having the formation break up and then re-form. For the most part, phalanx warfare in Classical Greece involved a forward advance or charge against an enemy and face-to-face combat. Due to this inflexibility, the flanks of the formation were quite vulnerable and were regularly protected by contingents of more mobile troops like cavalry and light-armed skirmishers (*psiloi*).

The phalanx could also be arranged into different shapes depending upon the situation. Xenophon (*Hellenica* 7.5.22–23) describes how the Thebans at Mantinea (362) deployed in a wedge-shaped formation (*embolon*). Both Diodorus Siculus and Plutarch's *Pelopidas* describe the Theban deployment at Leuctra (371) as an oblique line. Xenophon's mercenaries formed a defensive circle (*kyklos*) while making a river crossing, and the defensive square (*plasion*) was also a common deployment for hoplite armies when hard pressed from all sides on the march (for example, see Thucydides 4.125, Xenophon, *Hellenica* 4.3.4, and *Anabasis* 3.2.36). This shows that the Classical phalanx was very adaptable to the varied nature of the battlefield (despite being relatively inflexible once

fighting had actually commenced).

Hellenistic Period (ca. 323–30)

The Macedonian phalanx of the Hellenistic Period (see second illustration) replaced hoplite spearmen with phalangites equipped with a much longer, two-handed, spear (*sarissa*). The sight of a Macedonian phalanx struck terror into all who witnessed it. Polyaeus (*Excerpts* 18.4) calls the formation an “invincible beast.” The Roman historian Livy (44.41) states that “the phalanx is irresistible when it is closely packed and bristling with extended pikes.” At the battle of Gaugamela in 331, the phalanx of Alexander the Great is said to have “rolled forward like a flood” (Plutarch, *Alexander* 33). Plutarch (*Aemilius Paulus* 19) says that Aemilius Paulus, the Roman commander facing a Macedonian phalanx at the battle of Pydna in 168, “had never seen a more fearful sight.” Diodorus (17.4.4) simply states that the sight of the Macedonian phalanx “causes concern.”

Macedonian Phalanx According to Asclepiodotus

The smallest unit within the Hellenistic phalanx was a file (*stoichein* or *dekad* or *enomotia*) of 16 men. Each file had an officer (called a *dekadarchos*) in position one, a “half-file closer” (*dekastateros*) in position eight, a half-file leader (*dimoirites*) in position nine, and a file-closing officer (*ouragos*) in position 16. Between these officers (positions 2–7 and 10–15) were positioned regular soldiers. This arrangement allowed for the depth of the phalanx to be reduced through the process of “doubling” whereby the

rear half-file moved forward into the intervals between the files—reducing the depth of the formation to eight, doubling the number of men across the front, and leaving a row of officers across its front and rear ranks.

Asclepiodotus, Aelian, and Arrian state that a “perfect phalanx” of 16,384 men was formed by continually merging smaller units together in the sequence given in the table titled “Macedonian Phalanx According to Asclepiodotus.”

The *syntagma*, a square formation of 16 files of 16 men, was the basic tactical formation of a Macedonian army. Attached to each *syntagma* were five supernumeraries: a standard bearer (*semeiphoros*), a rear commander (*ouragos*), a trumpeter (*salpingktes*), an aide-de-camp (*hyperetes*), and a herald (*stratokeryx*). The basic operational formation was the *chiliarchia* containing 4 *syntagmae*. The larger *di-phalangarchia*/meros was considered one wing of the entire phalanx and was essentially an army in itself.

Many scholars attribute the creation of the Macedonian phalanx to Philip II of Macedon—the father of Alexander the Great. However, there is no conclusive evidence to support this. The forerunner of the Hellenistic phalangite, the Iphicratean peltast, was perhaps created in 374 by the Athenian Iphicrates—5 years before Philip became king of Macedon—and Iphicrates had close ties to the Macedonian royal house (see: Anaximenes, *FrGrHist.* 72 F4; Aeschines, 2 [*On the Legation*] 26–29).

The Hellenistic phalanx employed all three intervals used in the Classical Period. Aelian (*Tactics* 31) states that the close-order interval was only used when moving units around the battlefield prior to the commencement of hostilities during which time the phalangites held their long pikes vertically. Thus, unlike the close-order Classical formations, the close-order Hellenistic phalanx was not a combat formation. When deployed for combat in intermediate-order, the pikes held by the first five ranks of the Hellenistic phalanx projected between the files and beyond the front of the line. The phalangites in ranks 6–16 held their pikes angled forward over the heads of the men in front to provide a protective screen against volleys of incoming missiles (Polybius 18.30).

Despite its formidable appearance, the Macedonian pike-phalanx was an inflexible formation. Once moving forward, the lengthy pikes projecting ahead of the formation made it almost impossible to wheel about or to turn suddenly to face an unexpected attack from the side. This made the flanks of the phalanx vulnerable unless they were protected by cavalry, hoplites, and

light infantry (*psiloi*). If large gaps formed in the line, or if a more mobile enemy managed to get inside the presented pikes, the phalanx was similarly imperiled. The sheer size of the *syntagma*, and the encumbrance of the phalangite's equipment, meant that to maintain the integrity of the formation the phalanx could only move slowly. Tactics employing the use of the Macedonian phalanx relied on it acting as a solid mass of pikes in the center of an army group, forcing the enemy to face it head-on while more mobile troops swept around the enemy's wings to attack them from the side (the hammer), forcing them onto the phalanx (the anvil). In all of his major battles (Granicus, Issus, Gaugamela, Hydaspes), Alexander the Great employed this same tactic—he clearly knew the strengths and weaknesses of the phalanx and how to use it to its full advantage. Even the length of the *sarissa* itself aided this tactic.

The Macedonian phalanx was one of the most dominant military formations for nearly 200 years. Employed with great effect by Alexander, armies of *sarissa*-wielding phalangites allowed the Macedonians to conquer Greece and the surrounding regions, destroy the Persian Empire, and extend their reach as far as India. Yet the weaknesses of the Macedonian phalanx allowed it to be finally overcome by an organized army that utilized formations that could exploit gaps and opportunities that a rigid phalanx-style system could not—the mobile maniples of the Roman Republic.

Pharnabazus (d. ca. 370)

Pharnabazus was a Persian noble who governed the satrapy of Dascylium (Phrygia) ca. 413–370. This coincided with the latter stages of the Second Peloponnesian War (431–404), Sparta's postwar operations in Asia Minor, and the Corinthian War (395–387/6). Pharnabazus therefore had considerable contact with the Greeks, both as an ally and opponent. Xenophon was sufficiently impressed by Pharnabazus to provide a reasonably detailed portrait of him, essentially as a Greek gentleman, albeit with the full trappings of Persian aristocracy.

Pharnabazus adopted a pro-Spartan line during the Greek operations in his region during the Peloponnesian War, presumably because he saw the Athenians as a greater threat. He provided financial and other support to the Peloponnesian fleet and directly fought against Athens at Abydos, Cyzicus, and Chalcedon. However, he later encouraged the Athenians to negotiate support from the king himself, Darius II, probably to ensure the Peloponnesians did not become too powerful.

Pharnabazus had an interesting relationship with his fellow-satrap Tissaphernes. Ironically, although the Peloponnesians regarded Pharnabazus as the more honest of the two to deal with during their war with Athens, his territory was later the main target of Spartan operations—largely because of Tissaphernes' intrigues.

Although hampered by the superior quality of the opposing Greek hoplites and navy, Pharnabazus seems to have been a solid military commander. His use of cavalry against foragers from the Ten Thousand (401/400) and Agesilaus II (395) was highly effective. For a Persian aristocrat, he showed an unusual interest in naval operations, including commanding the fleet at Cnidus (394) with Conon.

Pharnabazus was also apparently good at administration and court politics. Not only did he serve as satrap for around 40 years but he was also given the Great King's daughter as a wife and entrusted with two (albeit unsuccessful) commands to recover Egypt (in 385 and 374).

Phayllus (d. 351)

Phayllus was a Phocian commander during the Third Sacred War. In 353 he led an expedition into Thessaly, but was defeated by Philip II of Macedon. He succeeded his brother Onomarchus in command on the latter's death in 352. With the help of Spartans, Athenians, and Achaeans, he succeeded in keeping Philip from entering southern Greece at Thermopylae. An invasion of Boeotia led to a series of defeats, but he was more successful in a campaign against the eastern Locrians, only to fall sick and die of a wasting disease after capturing and razing the city of Naryx. He was succeeded as commander by Onomarchus' son, Phalaecus.

Pheidippides (d. ca. 490)

Pheidippides (also Philippides) was an Athenian herald and courier. In 490,

when the Persians landed at Marathon, he was sent to Sparta to request help. He is reputed to have covered the 150-mile (240-kilometer) trip in two days. Herodotus records only Pheidippides' run to Sparta (during which he had a vision of Pan), but later authors added a return trip the next day, and then a 26 mile (42 kilometer) run from Marathon to Athens to announce the Athenian victory. Pheidippides is supposed to have collapsed and died after making the announcement. This last run was the inspiration for the modern day marathon running event.

Pheidon of Argos (ca. 720–ca. 660)

Pheidon, a hereditary king of Argos who turned his rule into the unlimited personal power of a tyrant, was an important but poorly documented figure in the early history of the Peloponnese. He made Argos the leading power in the Peloponnese in place of Sparta and took over from Elis the celebration of an Olympic festival (possibly that of 668). As a strong centralizing ruler, he introduced a new uniform system of weights and measures that was widely used. He was also credited (wrongly) with the first issue of coinage in mainland Greece at Aegina. Modern hypotheses have connected Pheidon with the Argive defeat of Sparta at Hysiae in 669/8 and, more broadly, with the development of hoplite phalanx warfare, of which he may have been a pioneer. Later sources place his reign at different times from 895 to just before 657. Herodotus (6.127) may indicate an early sixth-century date.

Pherae

Pherae was a major city in southeastern Thessaly, a little inland from the site of the modern city of Volos. Pherae had agricultural wealth, dominating the southern part of the plain west of Lake Boebe. In Homer's *Iliad*, the Pheraean Admetus (who also appears in Euripides' play, *Alcestis*) sends his son with 11 ships to the Trojan War. Pheraean prosperity may have increased with the development of a harbor town at Pagasae, on the Gulf of Volos.

During the Peloponnesian War (431–404), Pherae supported Athens, and was among a number of Thessalian cities that sent cavalry to help defend Attica against enemy incursions. Afterward, the city became the dominant power in Thessaly under a series of tyrants, who made extensive use of mercenaries: Lycophron, Jason, and Alexander.

This period of Pheraean greatness lasted for half a century. In 404, Lycophron, aiming according to Xenophon at ruling the whole of Thessaly, defeated the Larissans and other Thessalians in battle. Sometime after Lycophron's death in 390, Jason (who may have been his son) came to power and by the late 370s had established himself as the dominant power in northern Greece. But Pheraean power declined after Jason's assassination in 370 and Alexander of Pherae's defeat by the Boeotians at Cynoscephalae in 364. After Alexander's death in the early 350s, Pherae came under the control of Philip of Macedon, who installed a garrison in 344.

Pherae remained under Macedonian control until 197, when Titus Quinctius Flamininus defeated Philip V of Macedon in the Second Macedonian War. By this time the leading city in southeast Thessaly was Demetrias, founded near Pagasae by Demetrius I around 290. Nevertheless,

Pherae regained its position as a leading member of a renewed Thessalian League, but apart from being plundered by the Macedonians in the Third Macedonian War, largely drops out of history. Inscriptions show that it continued to thrive into Roman times.

Phila (ca. 350–288)

Phila, the eldest daughter of Antipater, Alexander's regent in Macedonia, was born ca. 350. She was married first to Balacrus, a prominent Macedonian officer, to whom she bore one son, Antipater. After being widowed, she married Craterus in 322, with whom she also had one son, Craterus. Finally she was married to Demetrius I Poliorcetes in 320, despite being considerably older than him (he was about 16 at this time). This highly unusual disparity in ages was the price of dynastic marriage. They had two children, Antigonus II Gonatas and Stratonice.

She was the first woman of the Successors' dynasties to receive a royal title, and was referred to as *Basilissa* in inscriptions dated to ca. 306. She was also the first Hellenistic royal woman to receive cult worship. She was known for being wise and resourceful, and appears to have occasionally played a role in politics. Her popularity among the Macedonians was a major factor in Demetrius' ability to claim the throne. She bore Demetrius' numerous infidelities patiently. When he married an Epirote princess she withdrew but returned to him after his defeat at the battle of Ipsus in 301. When Demetrius was driven out of Macedonia by Pyrrhus and Lysimachus in 288, Phila could not bear the shame and so committed suicide by poison.

Philip II of Macedon (ca. 383–336)

Philip II was the father of Alexander the Great and king of Macedonia from 359 until his death. As king, he oversaw a dramatic increase in the power of Macedonia over Greece, primarily through military force. At the time of his death, Macedonia was the dominant power in Greece, having defeated a coalition of states on the battlefield and then enforcing a peace through the Hellenic League (League of Corinth). His restructuring of Greece and strengthening of the Macedonian military provided a basis for Alexander's later campaigns against the Persian Empire.

During his youth, Philip was sent as a hostage by the Macedonian royal family to Thebes. During those years, he developed close ties with Epaminondas, the influential Theban general and statesman. After Philip's return to Macedonia, his brother, the king, Perdiccas III, fell in battle with the Illyrians (359). Philip may have acted as regent for his infant nephew, Amyntas, before becoming king himself.

Following the defeat of Perdiccas, Macedonia was under extreme pressure from outside forces. The battle which claimed Perdiccas' life had also claimed several thousand fighting men; Illyrian and Paeonian forces were encroaching on Macedonian territory from the north; and rival claimants to the throne were supported by Thrace and Athens. As a result, the first years of Philip's reign were focused on securing Macedonia from outside forces.

To that end, Philip addressed the issues individually. He withdrew Macedonia's claim to the city of Amphipolis, thus appeasing Athens, and bribed the Thracian king who was supporting one of his rivals. He then set out to greatly increase Macedonian military power. The improvements that

he made to the military had far-reaching consequences, well beyond his own reign. Most well known are his development of the *sarissa*, the elongated spear which gave the Macedonian phalanx superiority over other infantry, and the establishment of a corps of siege engineers in his army. The results of his military improvements led to decisive victories against Paeonia and Illyria in 358, before he broke his pact with Athens and in 357 took control of Amphipolis by force.

Silver tetradrachm of Philip II of Macedon minted in Macedonia, fourth century. The image here is of Zeus, with a laurel wreath; the reverse depicts a young horseman carrying a palm of victory. The coin is designed to convey divinely granted royal power handed down through the dynasty—an important message for stability and continuity. Located in the Yale University Art Gallery, New Haven, Connecticut. (Yale University Art Gallery)

In 353, Philip was called into Thessaly, during a civil war between the

two major cities of Larissa and Pherae. This struggle had its roots in the Third Sacred War, with Pherae supporting the Phocians, who had seized Delphi, in their war against other members of the Delphic Amphictyony. Siding with Larissa, after some initial defeats Philip bested the Phocian general Onomarchus at the battle of the Crocus Field in 352, and was installed as Tagos of Thessaly, giving him access to the highest quality stocks of cavalry horses that were native to the region.

After this, Philip dedicated several years to expansion in the north, particularly in taking the Chalcidice Peninsula. In 346, fearful of Philip's growing power, the leaders of Greece assembled at a peace conference in Macedonia. Philip controlled the negotiations, which arrived at a settlement known as the Peace of Philocrates.

Crucially, however, Phocis was excluded from the terms of the treaty, allowing Philip to end the Sacred War. Once the treaty was concluded, he marched on Thermopylae, which he took without a battle. With nothing standing between them and Philip's army, the Phocians surrendered, were stripped of their position on the Amphictyonic Council, disarmed, and had their cities broken up into villages. Philip was rewarded with the Phocian votes on the Council and the honor of hosting the upcoming Pythian Games.

Over the following years, Philip focused his attention eastward. He expanded his influence throughout Thrace and even into Scythia, before turning his attention to the region surrounding the Hellespont. When he laid siege to Perinthus, on the north shore of the Sea of Marmara, the Perinthians received aid not only from nearby Byzantium, but also from the Persian Empire, which was fearful of the growth of Macedonian power near their borders. After a hard siege in which Philip made only small advances, he took half his army to simultaneously besiege Byzantium. This action alarmed Athens, which sent a force to aid the city. Philip lifted both sieges and withdrew, before declaring outright war upon Athens shortly after.

This dispute came to a head in 338 at the battle of Chaeronea. Entering central Greece on a pretext provided by the Fourth Sacred War, Philip with his allies confronted a hastily-arranged alliance of Athens, Thebes, and others. The Macedonians won a decisive victory through the well-trained maneuvers of their infantry coupled with the superiority of their cavalry on the left wing, led by Alexander. The Greek dead numbered in the thousands, including the Theban elite fighting corps, known as the Sacred Band. With

his superior infantry and cavalry, Philip had defeated the final major opposition to him in Greece.

In the aftermath of Chaeronea, Philip established the Hellenic League, or League of Corinth, as a panhellenic council to represent his new unified Greece. All participant states were bound to a Common Peace under this body, with Sparta being the only major state missing. Philip did not attack Sparta but, detaching its surrounding territories, left it isolated. Philip was elected as the leader of the united Greek forces on the promise of a joint invasion of Persia. Preparations for this campaign were made and Philip sent a preliminary force under several of his generals into Asia Minor.

These plans were interrupted by Philip's assassination during his daughter's wedding at Aegae in 336. Pausanias, one of Philip's royal bodyguards, was named as the assassin. However, Pausanias' precise motives and whether or not there was a larger conspiracy involved is unclear. Alexander was swiftly installed as the new Macedonian king.

Philip II of Macedon, Campaigns against Illyria and Thrace (359–340)

Philip II fought several campaigns against Illyria and Thrace. The first was

to ensure survival after Bardylis' Illyrians defeated and killed Philip's brother, Perdiccas III (359). This exposed Macedon to considerable danger—the Paeonians threatened from the north, the Illyrians from the northwest, and the Thracians from the northeast. Philip bought off the Thracians (and Athenians), dealt with several pretenders, and built up his army.

In 358 Philip decisively defeated the Paeonians and then demonstrated the quality of his generalship and his remodeled army by destroying Bardylis' army. The Illyrian casualties (7,000) were particularly high because of Philip's use of cavalry in an extended pursuit.

This early engagement was part of Philip's immediate attempts to secure Macedonian survival. The victory over Bardylis also regained control over Macedonian territory lost in 359. However, once he had secured his reign and country, the later campaigns were designed to provide long-term security to Macedon, expand its territory and influence, and gain booty.

In 356, Philip was faced by a Paeonian, Illyrian, and Thracian coalition—supported by Athens and the Chalcidian confederacy. Philip's general Parmenion pushed the Illyrians back from Macedon while Philip advanced east—temporarily leaving his siege of Potidaea—to help Crenides against Cersobleptes of Thrace. Cersobleptes withdrew without a fight; Philip garrisoned Crenides and returned to take Potidaea. The minor Thracian king Cetriporis was probably reduced to vassal status at this time.

Philip advanced into Thrace in 353 but withdrew to capitalize on events in Thessaly. In autumn 352 he marched north again. Cersobleptes, warring against fellow Thracians and perhaps also against Byzantium, was the main target. Philip struck deep, reaching the sea north of the Thracian Chersonese, and Cersobleptes surrendered. He renounced his territorial claims, ended his Athenian alliance, and became Philip's vassal. Illness seems to have cut Philip's campaign short.

With Thrace (temporarily) under control, in 351 (or 350) Philip campaigned in Illyria, Epirus, and possibly Paeonia. Nothing is known of this Illyrian campaign and Philip was not again active there until 345, extending control west to the Adriatic. The Dardanians (Bardylis' people) were reduced to client status but the Ardiaei under Pleuratus, beaten in battle were not conquered—Philip was wounded and apparently made peace. The final Illyrian campaign (337) against a Pleurias (possibly leader of the Autariatae) seems designed to keep the frontier quiet before Philip's attack on Persia.

In 346, between his Illyrian campaigns, Philip conducted a short, decisive Thracian campaign, confirming Cersobleptes as a vassal. However, his final, and biggest, Thracian campaign was 342–340. The reason (or excuse) was probably Cersobleptes' attacks on Greek cities in the Hellespont area. The attack was a sustained one—Philip did not return home for winter, and he and Alexander (who had his first independent command there in 340) founded new cities with non-Thracian settlers to help pacify the region. Cersobleptes and Teres, another Odrysian leader, were driven out and the region largely fell under Macedonian control.

Philip's early Illyrian and Thracian campaigns were for survival. The later ones were to stabilize and protect (or regain) Macedonian territory, while the last few were to extend his possessions and to provide security against hostile tribal neighbors.

Philip III Arrhidaeus (ca. 358–317)

Arrhidaeus, as he was originally named, was the illegitimate son of Philip II of Macedon and a Thessalian concubine Philinna. As he was intellectually handicapped or psychiatrically ill, he survived the accession to the throne of his half-brother Alexander III the Great. He apparently accompanied Alexander throughout the invasion of the Persian Empire but held no position of authority. After Alexander's death (June 323) the Macedonian army insisted on his becoming king. He took the royal name of Philip and shared the royal power with Alexander's posthumous son Alexander IV.

Merely a nominal king, Philip was a pawn in the hands of a series of Macedonian warlords and also of his wife, Eurydice, a granddaughter of

Philip II. In 318 she used him to seize power in Macedonia with the aid of Cassander. When challenged by an Epirote army headed by Alexander the Great's mother Olympias, Philip and Eurydice were deserted by their troops (317). Olympias had him executed.

Philip V (238/7–179)

Philip V, king of Macedon from 222 to 179, despite his many qualities and talents, is remembered only as the king who chose the wrong side and in so doing brought an end to Macedonian power and independence. Philip was the son of Demetrius II (239–229), who died when Philip was only eight years old. The regency was taken up by the late king's brother, Antigonus III Doson (229–222) and on his death the royal mantle fell to Philip, who was only 15.

In 220, Philip was faced with the Social War, a contest between the Aetolian League and the Achaean League, but he also had to consider the threat from the Illyrians. It was not until the winter of 219/18 that Philip finally arrived at Corinth and from there pushed the Aetolians out of Elis in a rapid campaign. In the following summer, Philip attacked and sacked the Aetolian capital, Thermus, before turning on Laconia. The Social War was concluded in 217, partly because of events in Italy.

News of Cannae, and encouragement from Demetrius of Pharos, inspired Philip to ally with Hannibal, which forced the Romans to station a fleet at Brundisium. Philip's hesitant activities between 214 and 213 did nothing to advance his position. His failure to connect with Hannibal at Tarentum in 212 is inexplicable. In 211 the Romans formed an anti-Macedonian alliance which included the Aetolians, Illyrians, and Attalus of

Pergamum, but little was accomplished on either side and a peace was negotiated in 205.

Philip used the peace to extend his possessions in the Aegean and from 205 to 200 he captured many of the islands and Ionian cities of the coast. In 200, however, the Romans reopened hostilities and despite an invasion of Macedon by the Dardanians in 199, Philip was able to hold his own until Titus Quinctius Flamininus arrived in the theater in 198. Flamininus defeated Philip in the battle of Cynoscephalae in 197. A peace was negotiated in which Philip retained his throne but lost all of his holdings outside Macedon including his fleet.

The invasion of Greece by Antiochus III the Great in 192 forced the Romans and Philip into alliance but Philip continued to work as covertly as possible to restore his power. The latter years of Philip's life were, however, more consumed by family strife. Jealousy between Demetrius, his eldest son, and Perseus, the younger, resulted in the execution of Demetrius. Philip died in 197, apparently consumed with guilt and remorse.

Philo of Byzantium (Active ca. 200)

Philo of Byzantium, or Philo Mechanicus, was a writer on mechanics, and civil and military engineering ca. 200. Little is known of his life and career. Philo alludes to lengthy stays at Alexandria and Rhodes, though his location at the time of writing is never specified. He implies that he was somewhat younger than the renowned Alexandrian inventor Ctesibius (ca. 270–230), whose advances in ballistics and pneumatics he refined, but their personal acquaintance is uncertain. Philo wrote a large technological compendium

entitled *Mechanike syntaxis*, the first of its kind, which is mostly lost. Surviving books are addressed to Ariston, an otherwise unknown correspondent or possibly patron, to whom each volume was sent independently in accordance with a previously outlined program. Its content and arrangement are conventionally reconstructed as: 1 *Eisagoge* (introduction); 2 *Mochlika* (levers); 3 *Limenopoiika* (harbor construction); 4 *Belopoiika* (artillery construction); 5 *Pneumatika* (pneumatic principles and devices); 6 *Automatopoiika* (mechanical amusements); 7 *Paraskeuastika* (defensive preparations); 8 *Poliorketika* (siegecraft). Philo also indicates his intention to write about methods of sending secret messages, as employed in warfare and espionage, in either a ninth book or a separate treatise. The extant Greek text of Philo's writings comprises only Book 4, together with extensive excerpts of 7 and 8 (which older scholarship considered a single Book, formerly misnumbered 5). The survival of these three strictly military books probably reflects the selective interests of Byzantine editors. The *Pneumatika* is preserved in Arabic translation, heavily interpolated by medieval scholars, and in a partial Latin translation of another, now-lost Arabic version.

The *Belopoiika* (translated in Marsden 1971) contains technical specifications for the construction of artillery, principally torsion-powered catapults. Philo assimilates empirical techniques he learned from artificers in workshops at Rhodes and Alexandria, some of whom had worked with Ctesibius. He critiques recent developments and proposes enhancements to both standard components and famous devices constructed by his predecessors. Philo's debt to lost writings by Ctesibius cannot be demonstrated or quantified.

Philo's *Paraskeuastika* and *Poliorketika* (translated in Diels and Schramm 1920, Garlan 1974, and [parts only] Lawrence 1979) constitute a comprehensive guide to defending and attacking a Hellenistic city. The *Paraskeuastika*, the only treatise on fortification to have survived from antiquity, contains detailed recommendations for the design, layout, and construction of walls, towers, battlements, and outworks, as well as the organization of manpower and provisions before and during a siege. The *Poliorketika* prescribes engineering techniques, equipment, and tactics to be used by besieger and besieged. The extent of Philo's firsthand experience or dependence on written sources is unclear, but both the *Paraskeuastika* and *Poliorketika* contain material drawn, directly or indirectly, from the

poliorcetic treatise of Aeneas Tacticus (completed in the 350s). Some modern attempts to place Philo's writings on fortifications and siegecraft in a specific historical, military, and/or geographical setting possibly exaggerate his military objectives and expertise in isolation from his wider technological interests. The *Paraskeuastika* and *Poliorketika* became influential models for Byzantine military literature.

Philocrates (ca. 390–ca. 330)

Philocrates was an Athenian politician who took the leading role in making the peace treaty with Philip II of Macedon known as the “Peace of Philocrates.” He proposed both the initial assembly decree in 348 authorizing negotiations with Philip and all the subsequent decrees on the treaty. He served on the first embassy to Philip that brought back to Athens Philip's proposals (about February, 346) and then on the second embassy (May–early July, 346) that took some three months to secure Philip's oaths to the treaty.

Philocrates had the cooperation of Demosthenes at first but the latter

fell out with him on the second embassy, alleging that Philip had bribed Philocrates and others to betray Athenian interests. In the crucial meetings of the Athenian assembly in mid-July 346 that ratified the treaty, Philocrates easily dismissed Demosthenes' objections.

Demosthenes and others continued to undermine the peace treaty by exploiting Athenian disappointment over Philip's actions. In 343 Philocrates was formally indicted for high treason but fled into exile before the trial, so that he was condemned in absentia. This did not invalidate the treaty but had serious repercussions on Athenian relations with Philip.

Philocrates, Peace of (346)

The Peace of Philocrates was the treaty ratified in about July 346 between Athens and Philip II of Macedon, putting an end to the war that had lasted since Philip's capture of Amphipolis in 358. The treaty is commonly referred to by this name since the Athenian politician Philocrates was mainly responsible for bringing Athens into negotiations with Philip and he moved the relevant decrees in the Athenian assembly.

The events leading to the making of the treaty and the terms of the treaty itself are documented in great detail by speeches published by both the Athenian orator and politician Demosthenes and by his opponent Aeschines. These come from Demosthenes' prosecution of Aeschines for treason in 343 (the "False Embassy") and Aeschines' prosecution of an associate of Demosthenes in 331 (The "Crown" trial). This evidence, which consists largely of contradictory claims by rival politicians after the event, requires careful interpretation.

The treaty itself was first formulated as a peace agreement. It guaranteed either side's possession of territory then under its control and so excluded any later claims to disputed territory such as Amphipolis. The peace treaty was widened to include a defensive alliance between Philip and Athens and was extended to Philip's descendants.

The treaty was between Athens and Philip and their respective allies, but was so formulated as to exclude Athens' ally the Thracian king Cersobleptes and, more importantly, Phocis, which Athens was supporting in the Third Sacred War (356–346).

Philomelus (d. 354)

Philomelus was a Phocian aristocrat from the city of Ledon, who in 356 led his countrymen into the ultimately disastrous Third Sacred War. Philomelus was, according to Diodorus, a man of unusual boldness and lawlessness. In 356, the Delphic Amphictyony voted to fine some of the Phocians for farming sacred land. In response, Philomelus convinced the Phocians to claim their supposedly ancient rights as masters of the Delphic sanctuary. Elected supreme general by the Phocians and according to Diodorus, with the tacit agreement of Sparta, he used mercenaries and Phocian soldiers to seize Delphi and began plundering the treasures. Further increasing his forces, and bolstered by alliances with Athens and Sparta, he fought several successful battles with the neighboring Locrians, who then sought help from other members of the Amphictyony. Philomelus now found himself faced by much larger forces, including Boeotians and Thessalians. After further successes, in 354 he encountered a large Boeotian force on the slopes of Mount Parnassus. Cut off from his forces and fearing capture, Philomelus threw himself off a cliff, possibly that above the modern town of Ano

Tithorea. The Phocian command passed to Onomarchus.

Philopoemen (ca. 253–183/2)

Philopoemen was the son of Craugis, a native of Megalopolis and an Achaean general and statesman. He distinguished himself in the attempted defense of Megalopolis against Cleomenes III of Sparta in 223 and again at the battle of Sellasia in 222.

Philopoemen was 30 years of age when Cleomenes III attacked Megalopolis and although his force was insufficient to defend the city he nevertheless bought valuable time to enable the citizen population to evacuate it. Philopoemen suffered a wound and lost his horse during the fighting. At Sellasia the following year Philopoemen’s actions as a cavalry commander were the key to the victory over Cleomenes.

Philopoemen spent 10 years as a mercenary leader in Crete. When he returned to the Greek mainland he was elected as the cavalry commander for the whole of the Achaean League in 210–209 and his reorganized cavalry defeated an Aetolian force on the Elean frontier. As a general of the Achaean League in 208–207 he trained and equipped his troops to fight in the Macedonian manner and defeated a Spartan army at Mantinea in 207; Philopoemen himself killed the Spartan commander. Philopoemen was elected general again the following year and again in 201–200 when he defeated the Spartan forces under Nabis at Messene and at Tegea.

During the Second Macedonian War (200–196) Philopoemen urged the Achaean League to remain neutral. He himself went to the aid of the Gortynians in Crete and conducted a guerilla war for six years.

Upon his return Philopoemen was elected general for a fourth time in 193–192. Despite losing a naval battle to Nabis, Philopoemen managed to almost completely destroy his army but was prevented from taking Sparta by the Roman general Titus Quinctius Flamininus. He nevertheless managed to annex Sparta into the Achaean League, to the displeasure of Flamininus, and also added Messene and Elis to the Achaean League. When Messene rebelled in 183/2, Philopoemen was captured during a skirmish and forced to take poison.

Phocion (ca. 402/1–318)

Phocion was an upper-class Athenian who served as *strategos* (general) for 45 annual terms, the highest number known. He was widely respected for his integrity (getting the nickname of “The Good”) and for his competence. Leading Athenian generals had to play a role in politics: Phocion’s role was to urge caution at every turn. He was thus opposed to any forward or offensive strategy in Athens’ war against Philip II of Macedon or to such risky ventures as the Lamian War. Once war had been declared by the state, Phocion loyally and efficiently carried out the missions assigned to him, such as in Euboea in 348 and in the relief of Byzantium from Philip II’s siege in 340. He seems never to have been confronted with the challenging task of commanding mercenaries and the even more challenging task of finding pay for them, unlike Chares or Charidemus. It is not known what he did as general in 338/7, the year of the battle of Chaeronea.

Phocion’s conservatism and distance from Athenian democratic leaders made him the obvious person to negotiate with Antipater when Athens was

defeated in the Lamian War. He was able to accept, if he did not positively welcome, Antipater's overturning of Athens' democratic constitution. In 318 when Polyperchon's intervention brought about a brief restoration of the democracy, Phocion was condemned, in a travesty of a trial, for his loyalty to Antipater's settlement. His execution sealed his reputation as (yet another) loyal servant of the democracy who was treated ungratefully and harshly.

Phocis, Phocians

Phocis was a region in central Greece, occupying the 8,000-foot (2,400-meter) Mount Parnassus and areas to its north, east, and south. The mountain was used as a place of refuge in war and as a place to graze animals in summer; for the Phocians, it was a unifying rather than dividing feature. On the west, a narrow valley separated Parnassus from the territory of western Locris. North of the mountain, the heartland of Phocis was the wide valley of the Cephissus River, running east toward Boeotia. There was no physical barrier between Phocis and Boeotia, and the relationship between the two groups was often uneasy. South of Parnassus there was a more broken region, with cities in a number of valleys and on the Corinthian Gulf bays of Anticyra (Andikira) and Cirrha (Itea). There was easy communication with the Peloponnese across the Gulf. East of Parnassus there were routes linking the northern and southern parts of Phocis, while west of Phocis there was a good route between Parnassus and the mountains to the west from the Corinthian Gulf to the Malian Gulf (near Heraclea Trachinia). The Spartans in particular, for example, Brasidas

in 424, used this route to move troops to northern Greece, avoiding the Isthmus of Corinth.

In early times, archaeology suggests that the two areas of Phocis were not unified, but by the end of the sixth century the Phocians north and south of the mountain had formed a fairly tight-knit ethnic *koinon* (league), and at least in their own minds were ethnically one people. By the Classical Period they claimed (perhaps wrongly) that the important sanctuary of Apollo at Delphi was traditionally a Phocian sanctuary. To a remarkable degree, the Phocians were hostile to and disliked by their neighbors, such as the western and eastern Locrians (their territory split by that of Phocis) and the Boeotians. There was also persistent hostility between Phocis and Thessaly, and in the late sixth century the Phocians defeated a Thessalian attack. The Phocians and eastern Locrians were the only groups in central or northern Greece to fight against the Persian invasion of 480; Herodotus claims that the Phocians did so because of their hostility toward the medizing Thessalians. The result was that after Thermopylae the Persians sacked and burnt all the Phocian towns in the Cephissus valley, together with the temple of Apollo at Abae.

In the Second Sacred War (ca. 448) Athens supported Phocis' claim to control of Delphi, but by the start of the Second Peloponnesian War Phocis was an ally of Sparta. In 395 a border conflict between Phocis and Locris was instrumental in starting the Corinthian War. The great moment of Phocian power came in the Third Sacred War (356–346), when they seized the sanctuary at Delphi, looted the treasures, and hired large numbers of mercenaries. But in the aftermath of Philip II of Macedon's settlement of the war, the Phocian cities were broken into villages, and the Phocians for years had to pay a large war indemnity. The Phocians had recovered enough to contribute some forces to Alexander's campaigns, but they were never strong again. For most of the Hellenistic Period they came under the domination of the Aetolian League.

Phoenicia, Phoenicians

Like Greece, Phoenicia was not a nation, but a group of city-states linked by a common language, culture, ethnic origin, and religious practices. In the Bible, the Phoenicians are referred to as the Canaanites, a west Semitic people. But the more common name used to describe them appears to come from the Greek, *Phoinikes*, meaning “red men.” Scholars have debated the etymology, but it is generally agreed that it is derived from the reddish-purple dye they produced from sea snails and traded abroad. The Phoenicians themselves identified themselves as natives of their particular city (Sidonians, Tyrians, and so on).

It is ironic that the people who with the Phoenician script gave us the basis of the modern Western alphabet left behind very little written material. It is in the writings of other peoples and the archaeological record that we learn most about them. The Phoenicians first really appear in the historical record in the mid-fourteenth-century Armana correspondence, letters exchanged between the Phoenicians and Egyptians. These letters show how they had established themselves in well-defended, walled cities of the Levant. Their main centers were Tyre, Sidon, Byblos, Berytus (Beirut), Sarepta, and Arwad, but they also established colonies westward across the Mediterranean, the most famous being the great city of Carthage.

Phoenician cities are recorded as fielding light infantry units supplemented by chariots and archers, but it was their navies that provided their most powerful defensive force. The Phoenicians built and operated the greatest navies of the Mediterranean throughout most of the Classical and Hellenistic Periods. Herodotus claims that Phoenician sailors circumnavigated Africa around 600, and it is generally believed that their ships traded as far west as Cornwall for tin. Their merchant fleets certainly regularly serviced cities as far away as Spain, Africa, Sicily, and Cyprus. In the Levant, the Phoenicians had access to extensive cedar forests and other timber, useful for shipbuilding as well as to trade with their dominant

neighbors: Egypt, and later the Assyrians and Babylonians. From the 530s Phoenicia came under Persian control, but generally was able to enjoy a level of autonomy.

The Greeks believed that Cadmus, the legendary founder of Greek Thebes, was Phoenician, but the relationship with the Greeks was often more hostile, given overlapping colonial and maritime interests. To some extent Greek colonizers were more interested in agricultural land than the trade-oriented Phoenicians, but there was significant scope for conflict in areas such as Sicily.

Persia relied heavily on Phoenician fleets in its wars with the Greeks and Egypt. Phoenician service to Persia over the years earned them a degree of independence and important mercantile privileges. Herodotus tells us that the fleet from Tyre was pivotal in Cambyses' successful Egyptian campaign of 525. He also describes (6.6) the Phoenicians as the "most committed" of Persia's allies at the battle of Lade in 494. The Athenian Cimon was unsuccessful in ending Phoenician control of Cyprus in 450-449 and the resulting Peace of Callias (449/8) saw the Athenian fleets barred from Cyprus. Consequently, the Phoenician Cypriot city of Citium, flourished.

Persian rule of Phoenicia ended with the conquests of Alexander the Great, who captured Tyre after a protracted siege in 332. After changing hands several times in the decades following Alexander's death in 323, for most of the third century Phoenicia was controlled from Egypt by the Ptolemies. But the Seleucids regularly contested Ptolemaic control, and themselves ruled Phoenicia for the greater part of the second century. After a period of Armenian rule, Phoenicia became part of the Roman Empire in 65.

Phormio (d. 428)

Phormio (Phormion), son of Asopius, served Athens as *strategos* (general) ca. 440–428. He helped Pericles end Samos' revolt (440–439) and participated in the siege of Potidaea (432–429). On the outbreak of the Second Peloponnesian War (431–404) he was still in the Chalcidice, working with Perdiccas II of Macedon. Most of Phormio's service during the war was around the mouth of the Corinthian Gulf. His military record was good, with successes at Amphilocian Argos (430), a major victory over a Corinthian fleet near Naupactus (429), and in Acarnania (429). Shortly after his victory near Naupactus he was maneuvered into fighting a Peloponnesian fleet almost four times the size of his own but after an initial reverse managed to salvage the situation. Although an able general, he was assisted by the superiority of the Athenian navy over their opponents. He disappears from the record in 428 and may have died then (his son, Asopius, was elected *strategos* in 428/7).

Pindar (518–ca. 438)

A lyric poet from Boeotia, Pindar wrote mostly *epinikia* (victory odes), commissioned by wealthy winners in the *agōnes* (“athletic contests”) of Olympia, Delphi, Nemea, and the Isthmus. There is evidence to suggest that, as a Boeotian, Pindar accepted Theban neutrality in the Persian Wars, but that he also admired those who resisted. The stigma of being from “medizing” Boeotia does not seem to have affected him, with works

commissioned by a range of patrons. In early *epinikia*, he seems to admire Athens as champion of Hellenic freedom, but his later poems are critical of Athens' growing dominance.

Piracy

Piracy is a phenomenon found in the earliest Greek stories, and occurred throughout the Archaic, Classical, and Hellenistic Periods. The Greeks used two words to describe a pirate, *leistes* (plural *leistai*), and *peirates* (plural *peiratai*), although *peirates* is only found in writings dated after 300 while *leistes* is also used to describe a robber on land. The main issue when examining piracy is what activities should be considered piracy. Modern international law strictly defines piracy, but often in the past it was a label attached to anyone whose activities were deemed unsavory or illegal to a particular state. The generally accepted definition of piracy is robbery on the high seas by a nonstate actor; attacks on shipping by the armed forces of a state or hired by a state should be considered as falling under warfare or, in the latter case, as “privateering.” More important than what they were called is what they actually did.

Like piracy in the modern era, the roots of the problem extend from the land. Land scarcity, poor fishing, poverty, and other political/social issues could drive people to survive from piracy. In some cases, piracy may have been conducted on a purely opportunistic basis. The regular presence of a navy often helped suppress piracy, a concept now termed “good order at sea,” creating an environment conducive to maritime trade. Thucydides says that King Minos was the first Greek to construct a fleet and that he used it to suppress piracy. The strong navies of Athens, Ptolemaic Egypt, and

Rhodes all seemed to have contributed to maintaining stability and good order at sea in the Aegean while these states were the dominant sea power.

The types of vessels used by pirates are not well-known. Vase paintings show bireme type vessels being used, and in the Hellenistic Period the *hemiolia* (a fast light warship, probably with a crew of 50) became synonymous with piracy. This type of vessel was not used exclusively by pirates and could be found in navies throughout the Aegean, but its strong association with piracy suggests that it was the most common type of vessel used by pirates in the late Classical and Hellenistic Periods. Pirates preying on an area's local traffic may have used quite small vessels, equipped only to make short trips from land. Attacks on open-sea trade would have required larger vessels, but there is nothing to indicate that pirates used anything approaching the size or sophistication of a trireme, although those engaged in privateering may have had the resources to afford larger and more powerful vessels.

Pirates preyed on both merchant vessels and coastal towns and cities, taking not only goods but people as well. They might take everything from high-value items down to livestock and food supplies. Grain was a valuable commodity in the ancient world. Often pirates are described as taking ships and other vessels during raids, ships being high value targets in themselves. People were often taken, both for sale into slavery or in many cases to be held for ransom. It is perhaps the taking of people as slaves or hostages that most caused pirates to be hated, and the enslavement of people by pirates became a theme in literature.

The organization of pirate groups is virtually unknown. Later sources sometimes refer to an individual as an *archipeirates*—"arch-pirate." Clearly there would have been some sort of hierarchy among groups of pirates, based on either ability to fund pirate activities or in possessing above average skill in seamanship and navigation. Pirates in later times would not follow an unsuccessful captain and those trying their hand at such a dangerous activity would need to be sure they could make a living out of it.

The earliest mention of piracy in Greek literature comes from Homer. In two different episodes of the *Odyssey*, men are met with a very formulaic greeting, asking whether they were sailing the seas on business or raiding as pirates. These passages seem to indicate that piracy was a common enough occurrence, but there is a distinct note of disapproval regarding the activities of pirates.

Herodotus only mentions piracy once. He tells of an Ionian Greek, Dionysius of Phocaea, who decided that the Ionian Revolt of the 490s was doomed and, seizing three ships, sailed to Phoenicia where he amassed great wealth by attacking merchant vessels. He then sailed to Sicily and established himself as a pirate there, but only ever attacked non-Greek ships.

Thucydides mentions pirates at the beginning of his work, saying that it had been such a problem in the past that cities were usually built inland to protect them from pirate attacks. However, when he comes to the Peloponnesian War there is no mention of piracy outside of what might be termed privateering. Privateering is a concept just as hard as piracy to describe, but in its essence is the employment by a state power of private naval forces to wage war on their enemies. In 427 the Athenians attacked the island of Minoa off the coast of Megara to stop Spartan *leistai* from sailing out from the island. The attack comes four years into the war and suggests that the *leistai* on the island were a recent problem and that they were working for Sparta. Sparta was again employing pirates at the end of the war, when the Spartan admiral Lysander had in his employ a Milesian *leistes* named Theopompus. During Demetrius' siege of Rhodes from 305 to 303, he had as allies a group of *peiratai*, and Rhodians encountered three of these pirate ships out raiding merchant traffic at Demetrius' behest. These examples help demonstrate that pirates could hire out their services to a state power, especially one with a weak navy like Sparta, and thus be thought of as privateers. It also highlights the blurred line between piracy and normal warfare in the Greek world of the time.

City states across the Mediterranean region took steps to combat piracy and protect trade. Dionysius II, tyrant of Syracuse, founded two cities in the Apulian region in 359/8 to protect merchant vessels from pirates who had made the Adriatic shores unsafe for traders. The Athenians also established a colony in the Adriatic region in 325/4 to help combat piracy in the region. Rhodes above all is singled out by the ancient sources as a power which suppressed piracy to make the seas safe for merchant vessels. Diodorus says that on behalf of all the Greeks the Rhodians waged war on the pirates and purged the seas of these evil-doers in the late fourth century. They had a strong imperative to keep the seas free of pirates, since they seemed to have relied not just on maritime trade for prosperity, but in particular on grain from Egypt. Byzantium also made strong efforts to fight piracy in the Black

Sea in the late third century, protecting not only trade, but fishing vessels as well. The interconnected nature of trade saw cities taking bold steps to fight piracy, especially in the fourth and third centuries.

Just as some places had a reputation for fighting piracy, certain places gained a reputation for engaging in piracy. Taphian pirates feature in Homer, and in the fifth and fourth centuries many cities fought against Tyrrhenian pirates, a term sometimes used to describe pirates from Etruria but often as a general name for pirates generally operating out of Italy. In the late third century, Crete was known as a hotbed of piracy, provoking Rhodes into the first Cretan War ca. 206–203.

Piracy and privateering were common throughout all of Greek history, though the frequency and severity of pirate attacks waxed and waned as various maritime powers did their best to combat them. That piracy was such an issue helps demonstrate the proliferation and importance of the maritime economy to the Greek world, and it was an issue that would later plague the Roman world too.

Plataea

Plataea was a small city in southern Boeotia on the border with Attica. It had a long tradition of friendship with Athens and a desire not to be part of a larger Boeotia. Plataea became an ally of Athens in 519 to preserve its independence. It fought alongside the Athenians at the battle of Marathon

(490) and remained loyal to the Greek cause in the Persian invasion: it was razed by the Persians in 480, but 600 Plataeans fought in the great battle on their territory in 479.

After (if not before) Athens gave up Boeotia in 446, Plataea became part of the Boeotian League. Fearing its defection, Thebes made a surprise attack on Plataea in early 431. The attack failed, but was the hostile act that precipitated the Second Peloponnesian War (431–404). Most of the population of Plataea was evacuated to Athens and the city was garrisoned by about 400 Plataeans and 80 Athenian volunteers, plus 110 women to do the cooking. Plataea was besieged from 429 to 427. Over half the garrison broke out in winter 428/7. The rest surrendered in 427: the men were executed and the women enslaved.

The city was destroyed and given over to private occupiers. It was restored after the King's Peace (387/6) and remained an independent state, allied to Sparta, until, in 373, it was taken by a surprise Boeotian attack and again razed to the ground.

Plataea was restored by Philip as part of the settlement he established in the Greek world after his victory at Chaeronea (338). The Plataeans took part readily in the assault on and destruction of Thebes by Alexander the Great in 335.

In Hellenistic and Roman times, Plataea was the scene every year of two popular panhellenic festivals, one in honor of Zeus of Freedom, the other celebrating the Concord (Homonoia) of the Greeks. The first of these went back to religious ceremonies on the battlefield of Plataea in 479; the second began in the third century.

Plataea, Battle of (479)

Fought in September 479, Plataea was the final, and decisive, land battle of the Second Persian War. After the battle of Salamis (480), it took some time for the Spartans to lead an army north and when they did the Persian forces withdrew to Boeotia—the Greeks followed. Herodotus (9.32) gives the Persian numbers as 300,000 (including 50,000 Greeks) but this is probably exaggerated. Facing them across the Asopus River, the Greek army had 110,000 men but only 38,700 hoplites—the remainder were light-armed troops (*psiloi*). The Persians were commanded by Xerxes’ son-in-law, Mardonius; the Greeks by Pausanias, regent for his nephew Pleistoanax.

The course of the battle is difficult to reconstruct. Ancient locations are difficult to relate to modern ones and Herodotus’ description, the only near-contemporary account, is confused. This is partly because events *were* confused, but also because Herodotus was reliant on oral traditions about an important victory in which every Greek state wanted to share (cf. 9.85)—and on eye-witness accounts from old men, who would have seen only their small section of the action.

Twelve days of skirmishing, during which the Greeks suffered from constant cavalry attacks, preceded the battle. Both sides remained on the defensive either side of the Asopus. This was ostensibly because prebattle sacrifices were unfavorable to an attack, but it was also sound military practice not to attempt an opposed river crossing. On the eighth day, Persian cavalry interdicted the Greek supply lines and on the twelfth fouled the Gargaphia spring, an important part of the Greek water supply.

Short of supplies, and warned by Alexander I of Macedon of an impending Persian attack, the Greeks decided to move to a better position that night. A night move is always difficult, and most of the Greek center overshot the agreed position and halted at Plataea itself. The Spartans and

Tegeans on the right wing and the Athenians on the left moved late. After fruitless negotiations with Amompharetus, a Spartan commander who refused to withdraw, Pausanias eventually left him behind, moving parallel (but on the other side of a ridge line) to the Athenians. At sunrise, most Greeks were at Plataea (out of position), with the Athenians, Tegeans, and Spartans still marching, and Amompharetus trying to catch up. Seeing this, Mardonius launched a general attack on the Spartans and Tegeans. An attack by Persia's Greek allies prevented the Athenians from helping them. The Persian assault was uncoordinated, with contingents arriving piecemeal and Greek hoplites again proved superior to their more lightly armed and armored opponents. The Persians suffered heavy casualties, especially as Artabazus failed to immediately commit his sizeable force. When Mardonius was killed Artabazus withdrew and the rest of the Persians fled in disorder to their fortified camp. Most Greek casualties occurred in a cavalry attack on the main body of the Greek army, which had lost formation in a hasty pursuit of the fleeing Persians.

The area around Plataea, where the Greek destruction of the Persian army in 479 ended the Persian invasion of mainland Greece in the Second Persian War (480–479). The photo is looking northeast toward the Persian positions and shows the undulating nature of the terrain that contributed to the confused conduct of the battle. (Photo by Iain Spence)

The battle concluded with the Greeks storming the Persian palisades and annihilating the survivors. Although 40,000 escaped with Artabazus, Herodotus (9.70) records that only about another 3,000 Persians survived, with 159 Greeks killed in the main fighting and another 600 killed by the

Theban and Persian cavalry (9.69). Although the Persian casualties are undoubtedly exaggerated, the battle ended the Persian land threat to mainland Greece.

Plataea, Siege of (429–427)

In 431, the unsuccessful Theban attack on Plataea, an Athenian ally in Boeotia, precipitated the Second Peloponnesian War (431–404). In 429, the Peloponnesian League attacked Plataea instead of conducting the annual invasion of Attica, currently ravaged by plague. Thucydides provides a detailed contemporary account of the dramatic siege that followed.

Led by Archidamus II, the Spartans began a series of determined attempts to take the city. Most of the women and children and older men had been evacuated, leaving only 480 men (including 80 Athenians) as defenders, along with 110 female cooks. After building a wooden palisade around the city, the Peloponnesians constructed a mound against the city wall. The Plataeans delayed this by building their wall at the mound higher, then removing the lower part of the wall and digging away the base of the mound—until the Peloponnesians realized and filled in the gap. They then dug a mine under the wall and removed the mound from below as fast as the enemy could build it. Ultimately, the Plataeans built a new curved section of wall opposite the mound so any troops getting over would be

faced by a new wall in front and to their sides.

The Spartans also tried battering rams. However, the Plataeans successfully countered these by either dropping large chain-suspended beams to snap off the ram or by lassoing and breaking them. The next Spartan tactic was to set fire to the city. Numerous large bundles of wood were thrown inside the walls from their mound and set on fire, aided by sulfur and pitch, forcing the Plataeans to abandon large sections of the city. Unfortunately for the Peloponnesians, the wind failed to rise and (although Thucydides hints it was a later embellishment) a thunderstorm and heavy rain ended the attempt.

At this point the Spartans decided to starve the city out and replaced the palisade with a brick wall. During the winter, 212 defenders staged a daring night break-out across the enemy wall, aided by a diversionary attack by those left behind. The remaining defenders ran out of food in summer 427 and surrendered on the basis that they would receive a fair trial. However, the “trial” ended up as a simple question posed to each defender: “in the present war, have you done anything good for the Lacedaemonians and their allies?” (Thuc. 3.52.4). Only able to answer “no,” the defenders—around 200 Plataeans and 25 Athenians—were executed and the 110 women sold as slaves. After a year the city was razed by the Peloponnesians and the land handed over to Thebes. Thucydides notes that this harsh treatment was designed to keep Thebes a staunch ally. Ironically, Plataea was later restored by Sparta in 386 as a counterweight to rising Theban power.

Plunder and Booty

For Greeks, the capture of booty was one of the regular benefits of fighting wars, and could be one of the prime purposes. When the tyrant of Miletus, Aristagoras, tried to convince the Spartans to support the Ionian Revolt in the 490s, one of his key arguments according to Herodotus was the enormous quantity of booty to be obtained attacking the Persian Empire. When the Delian League was set up after the Persian invasion, the ostensible purpose was to make up Greek losses by ravaging Persian territory. In 415 Nicias accused Alcibiades of wanting to attack Sicily to get wealth to prop up his extravagant lifestyle. Thucydides tells us that many Thracians joined Sitalces' expedition in 429/8 out of hope of plunder. In the Hellenistic Period booty was a standard way of financing mercenary armies.

Classical Greek authors do not speak much about plunder, especially about Greeks plundering Greeks (most of the examples above involve non-Greeks as perpetrators or victims). But plunder, on the part both of individuals and of the state, was clearly a normal part of Greek warfare. One of the most regular parts of warfare was ravaging the enemy's countryside. When people knew that a hostile army was approaching, they naturally evacuated families, slaves, livestock, and other valuables, so far as was possible. Whatever of value was left would be stolen, unless that was not practical. Crops would generally simply be interfered with as much as time allowed, but sometimes armies harvested grain for their own use. During the Spartan occupation of Decelea in the Peloponnesian War many Boeotians, according to the *Hellenica Oxyrhynchia*, got rich from buying up captured slaves and other property at low prices, while some would carry back to Boeotia the timber and roof tiles from Attic houses. Attica, which apart from brief Spartan invasions earlier in the war had not been plundered for a long time, offered rich pickings, just as Chios did when the Athenians ravaged it in 412. When Demetrius I Poliorcetes besieged Rhodes in 305 and campaigned in Thessaly in 302, he allowed large numbers of private pirates or plunderers to take what they could.

The sack of cities naturally led to large amounts of private and public plunder; in the absence of any laws of war, it was entirely up to the victorious commanders to determine how much and for how long their soldiers might pillage the defeated city. Military camps, if captured, might hold surprising quantities of redeemable items, including soldiers' families, pay, and previous booty. Sanctuaries were supposed to be inviolable, but were sometimes plundered. Prisoners of war were often ransomed or

enslaved, sources of profit generally for the state, not for individuals. Surprisingly often defeated armies were massacred, despite the foregoing of economic gain. Captured slaves would rarely be freed (though sometimes slaves escaped during war and might be successful in setting themselves up as free men); those captured would simply become the victors' property. Captured livestock, especially cattle, was well worth driving away, while all other forms of portable property, including money, gold and silver, works of art, and so on, would be commandeered.

Plutarch (ca. 45–ca. 120 CE)

Plutarch came from an upper-class family in Chaeronea in Greece. His upper-class origins enabled him to spend a good part of his early life in study and travel. Later he returned to Chaeronea, keeping around him a circle of young admirers who looked up to him as a teacher. He served for some 30 years as a priest at Delphi and had numerous friends among the Roman aristocracy. Because of his social position and some services to imperial government, Plutarch received various honors, including Roman citizenship. However, in his outlook and in his chosen way of life, Plutarch was a citizen of a small but deeply loved Greek city.

Plutarch was steeped in the culture of the Greek past. His intellectual

interests centered on ethical philosophy, especially Platonism, but also embraced all the areas of knowledge cultivated by the educated class in his time. He was not a professional scholar but a learned gentleman of wide interests. In the later part of his life Plutarch produced a volume of written work that makes him one of the most prolific of Greek writers.

His best-known work is his *Parallel Lives*. These comprise 23 pairs of matching biographies, one Greek and one Roman. Plutarch wrote these for the ethical purpose of providing himself and his friends with examples of conduct to imitate or, in some cases, to avoid. He concentrates on character and carefully distances himself from the well-established genre of formal history. Plutarch also wrote separate Lives: *Aratus*, *Artaxerxes II*, and, from a series on Roman emperors, *Galba* and *Otho*.

Plutarch ranks as one of the most learned men in ancient times. He quotes in his writings some 439 different authors by name, from every branch of literature. His deep reading and wide interests differ, however, from modern concepts of research. His *Lives* provide abundant material for historical investigation but call for careful analysis and interpretation. For example, Plutarch is aware (*Themistocles* 27) that the historians closest to the time said that when Themistocles fled to Persia he met with Artaxerxes I (reigned 465–425). However, Plutarch also knew from later writers a story which he rather prefers, that Themistocles met with Xerxes, the Persian king he had outwitted at the battle of Salamis (480).

In addition to the *Lives*, Plutarch wrote a much larger body of treatises usually referred to collectively by the Latin title *Moralia*, meaning “Ethical Works.” Although moralizing is often explicit or close to surface, the term does not cover the enormous range of subjects that Plutarch dealt with, which range from philosophy to advice to a newly married couple. Among those of particular historical interest are *On the Malice of Herodotus* and *On the Fortune of Alexander the Great*, and a dialogue dealing with two of Plutarch’s special interests, Platonism and Boeotian history, set in Thebes in 379/78, *On the Daemonium of Socrates*.

Polyaenus (Active ca. 162–166 CE)

Polyaenus was a professional rhetorician from Macedonia who compiled a work in eight books entitled *Strategemata*, a collection of military tricks, devices, and procedures from the past that had been successful in war, usually against the odds. Polyaenus dedicated the work to the jointly ruling Roman emperors Marcus Aurelius and Lucius Verus, for the ostensible purpose of providing guidance in the Parthian War (162–166 CE).

The practical value of the work is slight: it makes no reference to conditions in Parthia. It belongs to a well-established literary genre, derived from more practical handbooks, of collecting interesting and instructive incidents from history. An earlier example is the *Strategemata* of the Roman Frontinus (lived ca. 35–103/4 CE). The author of the earliest known military treatise, Aeneas Tacticus (ca. 350) illustrated his advice with accounts of incidents drawn either from his own experience or from historical works. In the hands of a man of letters like Polyaenus, the encyclopedic collection of instances has become an end in itself.

Polyaenus collected material from both Greek and Roman history as well as from mythology, and included a section on stratagems by women (8.26–71). He drew from a wide range of authors, not necessarily at first hand. When other sources survive, Polyaenus occasionally adds a useful detail. When he is the only source, lack of context and his brevity limit his usefulness.

Polybius (ca. 200–118)

Polybius of Megalopolis was, like his father Lycortas, a leading figure in the politics of the Achaean League. In 167 Polybius was among the 1,000 leading citizens of the League deported as hostages to Rome after the defeat of King Perseus of Macedon. The surviving hostages were not released until 150. In his time in Italy, Polybius became a friend and advisor of Publius Cornelius Scipio Aemilianus, one of the most important men in Rome. Polybius accompanied Scipio in his command in the Third Carthaginian War and witnessed the destruction of Carthage.

As well as his *History*, Polybius wrote other works that have not survived: a eulogy of Philopoemen, a work on tactics, one on geography, and an account of Scipio's Numantine War. His great work, the *History*, was made up of 40 books. The first two books, beginning where Timaeus ended, gave a preliminary account of the years from the First Punic War (264–241) down to 220. In the rest Polybius took up what he rightly saw as the momentous 53 years (220–167) in which Rome became the dominant power in the Mediterranean world.

Polybius prided himself on writing “pragmatic” history, literally, “history dealing with affairs of state,” but meaning the serious and analytical kind of history that rose above sensationalism and romanticizing and offered elite readers insight into judging and making policy. Of all ancient historians, Polybius was closest, despite his own characteristics, to Thucydides in method and outlook. He had a deep interest in causation (3.6–7) and believed that the historian needed personal experience of political and military affairs. He saw the importance of travel to localities important in history. He made a crossing of the Alps to ascertain Hannibal's route and insisted that the historian needed to study the terrain of battlefields on the ground. His frequent references to “chance” (*tyche*) in history do not add anything beyond commonplace observation.

Of the 49 books of the *History*, only 1–5 survive intact. There are

substantial excerpts from books 1–18 and smaller and fewer excerpts from most of books 19–40. Polybius cast his work on the widest scale: it dealt with both Roman and Greek history, including coverage of the eastern Seleucid Empire and the Greek kingdoms of Bactria.

Polybius also devoted books to special thematic subjects: Book 6 on Roman political and social structures; Book 12 on historical writing; and Book 34 on geography. He strove to be impartial but could not conceal his dislike of Aetolians, anti-Roman Achaean League politicians, and historians who relied upon rhetorical fine writing. Polybius was a man of considerable intellectual capacity, wide interests and great industry. What he lacked was an ability to write concise and vivid prose.

Polycrates of Samos (Reigned Third Quarter of the Sixth Century)

Tradition claims Polycrates ascended to the throne around 533/2, but the archaeological evidence of several of his great works suggests the 540s are more likely. According to Pausanias, the Heraion (a monumental temple to Hera) was burnt by the Persians between 550 and 546, necessitating its

reconstruction (7.5.4). Aristotle attributes the great buildings of Samos' tyrants to Polycrates (*Politics* 1313b), whereas Herodotus simply credits the Samians for the Tunnel of Eupalinus, the fortification surrounding Pythagoreion's harbor, and the Heraion (3.64). An economic boost can also be deduced from new breeds of animals, the luxury foodstuffs, and a change in currency ca. 525. Polycrates is also credited with establishing a thalassocracy by naval supremacy and piracy, subjugating ships and islands. Trade was established with the Etruscans, the Athenians, and the Laconians as well as Egypt and Cyprus. Polycrates allied Samos with Naxos and Persia. Amasis of Egypt broke off their alliance in 526, allegedly out of envy for Samos' good fortune according to Herodotus (3.43). A more likely reason was the courting of Persian favor while the Persian king, Cambyses, invaded Egypt. Under Polycrates' leadership, Samos was attacked by Corinth and Sparta ca. 525 for the theft of 300 enslaved Corcyraean boys ca. 585. The Peloponnesian League's actions may also have been motivated by the threat of Samos becoming a Persian ally. The resultant 40-day siege marked the end of naval impunity for Samos in the Aegean Sea. Polycrates was assassinated by the Persian governor of Lydia, Oroetus, in 522.

Polyperchon (ca. 380–ca. 295)

An officer in Alexander the Great's army, Polyperchon was elected Craterus' second-in-command when he was sent with 10,000 discharged veterans to Macedonia. On his deathbed, Antipater named Polyperchon the guardian of the two kings, Alexander IV and Philip III Arrhidaeus. He initially had strong support, but faced opposition from Cassander. He sought to keep his position by extending support to Eumenes, and promised to oppose Antigonus I Monophthalmus in return for aid, but was unsuccessful.

He made a final bid for power when he allied with Heracles, the son of

Alexander and Barsine, and attempted to promote his claim to the kingship. Heracles had previously been overlooked as a candidate for the throne, partially because he may have been illegitimate. However, with the murder of Alexander IV in 310, he suddenly had a much stronger claim. Cassander was able to persuade Polyperchon to murder Heracles in exchange for a share in power, but in fact was given only a command in the Peloponnese. The murder, however, cost him this support in the long term. He continued to operate in the Peloponnese between the battle of Salamis (306) and the battle of Ipsus (301), and was still antagonizing Demetrius I Poliorcetes later in 295, when he would have been nearly 90. It is unknown what became of him.

Pontus

Pontus, in north Asia Minor, extended from the coast of the Black Sea south to Cappadocia and Armenia and from the Halys River to Colchis. It was a fertile region, with good deposits of iron, copper, and silver. It had a largely tribal nature, with a powerful nobility and priestly caste. The Greek colonies along its coast seem to have been originally founded for trade (especially in the local metals).

The kingdom of Pontus was founded under Mithridates I Ctistes (302–266). His successors developed significant alliances with the Seleucids, increased the power of the monarchy and reduced the power of the nobility and priests. Mithridates V Euergetes who reigned from ca. 152/1 until his assassination in 120 in particular extended Pontic territory, changed the

character of his court to make it more Greek, and developed strong ties with Rome. He supported Rome in the Third Punic War (149–146) and the slave revolt in Pergamum (133–129).

Pontus reached its greatest extent and power under Mithridates VI Eupator (reigned in his own right 113–63). However, his attempts to annex Cappadocia led to three wars against Rome, each of which Mithridates lost, culminating in the dissolution of Pontus as an independent entity (63/2).

Porus (Active 320s)

Porus was the ruler of the region between the Jhelum and Chenab Rivers in the Punjab and an opponent of Alexander the Great. It is probably impossible to recover his Indian name (“Porus” is the latinized version of his Greek name), but it may have been Paravatesha or Parvataka. Porus was apparently hostile to Taxiles, Alexander’s local Indian ally, and chose to resist Alexander’s advance, occupying a defensive position on the Hydaspes (Jhelum) River (326). Alexander outmaneuvered him by making a night crossing further up the river bank and then decisively defeated Porus’ main army. Impressed by Porus’ personal bravery, Alexander confirmed him as ruler of his own territory and allocated him additional territory, up to the Hyphasis (Beas) River.

Potidaea, Siege of (432–429)

The siege of Potidaea began six months before (and was one of the triggers for) the outbreak of the Second Peloponnesian War (431–404) and was one of the major operations of its opening stages. The serious deterioration of Athenian-Corinthian relations following the battle of Sybota (433) placed Potidaea in an awkward position. It was a colony of Corinth, which maintained strong links with Potidaea (including sending magistrates to serve there every year), but was also a tribute-paying member of Athens' Delian League. Corinth was certainly hostile to Athens and Athens was aware that Perdiccas II of Macedonia, recently alienated from Athens, was encouraging Potidaea (and other cities in the area) to revolt. Athens, therefore (432), demanded that Potidaea demolish its walls facing the sea, provide hostages, and cease the practice of accepting Corinthian magistrates. Whether Potidaea was already considering a revolt or not, these measures precipitated one.

Corinth sent out a force of 1,600 hoplites and 400 *psiloi* (light troops) to help. When an Athenian force of 3,000 hoplites, an unspecified number of allies, and 600 Macedonian cavalry from the enemies of Perdiccas II arrived, the Potidaeans and their Corinthian reinforcements marched out against them. Their plan of attacking the Athenians in the rear from Olynthus failed when the Athenians placed their Macedonian cavalry as a blocking force. The Potidaeans were quickly beaten, losing 300 men to the Athenians' 150. The Athenians began the siege by building a wall cutting Potidaea off from the north and using their fleet to block access from the sea. They were not strong enough to cut Potidaea off from the promontory of Pallene to the

south until an additional 1,600 troops under Phormio arrived. Another wall was constructed to the south and Potidaea was now effectively blockaded.

In 430, the Athenians sent out another army and attempted to take the city by storm, using siege engines. However, they were unable to achieve anything because they brought the plague with them from Athens and lost just over a quarter of the 4,000 hoplites in 40 days (Phormio and his 1,600 men were away and avoided this). The siege then settled back into one of starving Potidaea out. This tactic eventually succeeded—the city was so short of food that cases of cannibalism occurred—and in winter 430/29 it surrendered. The Athenian commanders, also suffering privations and concerned at the high cost of the siege (unusually for ancient warfare we know how much it cost—2,000 talents) allowed the inhabitants to leave with one garment each (two for women) and a fixed sum for travelling expenses. They were heavily criticized at Athens for not insisting on an unconditional settlement. The Athenians then sent out cleruchs (military settlers) to occupy the city and its territory.

Potidaea/Cassandreia

Founded by Corinth ca. 600, Potidaea was strategically located on the Pallene Peninsula of the Chalcidice, well suited to influence the shipping lanes of the north Aegean. Isocrates went so far as to say that Potidaea had the best strategic location in all of Thrace. It is certainly because of this

advantage that Potidaea was so often drawn into broader regional conflicts.

The Persians conquered Thrace in 513/2, and Potidaea came under their control. After the defeat of the Persians at Salamis in 480, Potidaea was one of the first cities to throw off Persian rule. As a member of the Delian League Potidaea retained its status as a colony of Corinth, but in 433/2 this dual and contradictory allegiance caused Potidaea to be drawn into the rapidly escalating conflict between Athens and Corinth. Potidaea seceded from Athens, resulting in a protracted siege, which was one of the factors leading to the outbreak of the Second Peloponnesian War. The Potidaeans capitulated in the winter of 430/29 and the city was depopulated and resettled by Athenians. Potidaea won its freedom in 404 when Athens surrendered to Sparta.

Olynthus took control of Potidaea by 382, but Sparta launched an attack that began with the capture of Potidaea. In 365/4, as an element of the competition between Athens and Thebes for control of the Aegean, Timotheus, the Athenian general, captured Potidaea, and caused the Thebans to withdraw from the theatre.

With the rise of Philip II of Macedon Potidaea once again became a central pawn in the geopolitical gamesmanship. Philip captured the city in 356, enslaved the people, and handed the city over to Olynthus in exchange for Pydna, but in 348 Philip captured Olynthus and Potidaea again fell under Macedonian rule.

Cassander changed the name of the city to Cassandreia in 315 and the city prospered under Macedonian rule. During the Macedonian anarchy (279–277), Apollodorus ruled as tyrant but Antigonus II Gonatas regained control and Cassandreia became the principal naval base for the last of the Macedonian kings until the fall of Perseus to the Romans in 168. In the reign of Augustus, Cassandreia was made a colony of Rome and the citizens granted Roman citizenship.

Prisoners of War and Slavery

Captives were a ubiquitous part of Greek warfare, especially at the conclusion of sieges. Depending on the specific circumstances of their capture and the needs or interests of their captors, prisoners of war might suffer any fate, ranging from execution to instant release. Most commonly, captives would be ransomed or were sold into slavery.

Ransoms usually seem to have been paid privately, meaning that a prisoner had to rely on his family or friends to raise the funds demanded and then actually deliver them to his captors. According to our sources, the state played no appreciable role in these matters, and so the captive and his family were entirely at the mercy of the captors in keeping their side of the bargain. Ransoms were usually quite exorbitant, between 100–200 drachmas, so only the wealthy could hope to be released in this way. A poorer person could of course obtain help from a rich patron, but at Athens, by law, that poorer person “belonged” to the ransomer until he paid back the money (Demosthenes 53 [*Against Nicostratus*] 11). On rare occasions, ransomed or released prisoners could be disfigured, such as occurred at the end of the Peloponnesian War when the Athenians threatened to cut the right hand off of any prisoners they took (Xenophon, *Hellenica* 2.1.31–2).

Prisoners who were not released or ransomed were usually enslaved. Slave labor was a fundamental part of the ancient Greek economy, although we know remarkably little about ancient Greek slavery. No extant ancient Greek writer discusses it at length. Slavery was essentially a legal status, imposed on the captive by right of conquest. That is, when a captive became a slave through the process of a sale, he or she lived without civil rights and was owned as a possession, usually by another individual, but sometimes by the state itself. The owner usually possessed the power of life and death over the slave, but at Athens, the law forbade the killing of a slave without the permission of the state. To his or her master, the slave owed all labor and service—including, if required, sexual favors. In exchange, the master

sheltered, clothed, and fed his slaves, just as he would be expected to care for his livestock. The origins of slavery as an institution are lost, but certainly slavery was not confined to the Greeks. In Homer's *Iliad* (written down around 750), slaves are shown to be war captives.

War was certainly one of the principal sources of slaves. A defeated people, Greek or non-Greek, could face slavery at the victors' discretion. For example, after subduing the Greek *polis* of Melos in 416, during the Second Peloponnesian War (431–404), the Athenians put to death the entire adult male population and sold the women and children into slavery (Thucydides 3.84).

Such captives would probably have been sold on the spot to slave traders, who followed Greek armies on campaign. Slave traders had access to cash and transport, with which they could bring their newly purchased slaves to a market for resale. The Greek states of Chios and Ephesus were important slave markets in the 400s; other commercial centers, such as Athens and Corinth, played their roles. On occasion, the supply of slaves could far outpace demand, and in such circumstances slave traders simply abandoned the oldest or youngest captives (Xenophon, *Agesilaus* 1.21–2).

The sale of prisoners as slaves divided families. The demand for adult male slaves was usually far less than the demand for women, teenagers, and children (purchased for domestic duties). Children were especially prized as long-term investments, but many mothers surely were left behind on the auction block.

In 425, the Athenians used Spartan captives as a bargaining chip—threatening to kill them if the Spartans invaded Attica. During the Hellenistic Period, captured Greek or Macedonian soldiers were sometimes used to create military settlements, as Ptolemy I Soter did in the Nile Delta in 321 and 312.

Aside from release, ransom, or enslavement, war captives were routinely executed. Although the methods employed for the execution of captives are not always known, an array of methods was available. The extant sources mention a number of common methods: shooting with javelins, piercing with arrows, slashing throats, stoning, strangulation, crucifixion, or flogging. Sometimes, various methods were used in combination, though not always by design. For example, in 424, the Athenians managed to kill 60 Corcyraean oligarchs by beating or stabbing as they ran the gauntlet between two lines of hoplites, but when word

finally reached those who remained to be killed, they rioted. Some opted to commit suicide and managed to strangle themselves with strips torn from clothing, or slashed their own throats with arrow-heads or roof tiles. Those that remained were eventually shot down by the Athenians with arrows and stones (Thucydides 4.47–8). The execution of prisoners was therefore logistically complicated, labor intensive, and even on occasion risky to the executioners. In general, the execution of war captives was justified *ex post facto*, as if the deaths occurred as a part of battle, and thus were entirely consistent with the conventions that normally governed Greek warfare. For the soldiers who actually performed such executions, the distinction between the justifiable killing of the enemy and cold-blooded murder would be critical to the preservation of their sense of honor.

Prodromoi

Both Athens and Macedon had *prodromoi* (lit. “fore-runners”). In a military context, the word usually refers to a mounted advance guard or mounted skirmishers operating in advance of an army, or as couriers. Xenophon advised potential Athenian cavalry commanders that they should demand

their *prodromoi* constantly practice, and become proficient in, the use of the javelin. In contrast, the Macedonian *prodromoi* of Alexander the Great appear to have been armed with a long lance, as they are occasionally referred to as *sarisophoroi* (sarissa bearers).

In the accounts of Alexander's campaigns the *prodromoi* are invariably mentioned as serving alongside the Paeonian cavalry. At the battle of Granicus (334), the Macedonian *prodromoi* fought on the right wing of Alexander's army, as they also did at the battle of Issus (333). The *prodromoi* carried out scouting duties prior to the battle of Gaugamela (331) and fought on the right wing alongside the Paeonians during the battle. In the aftermath of Gaugamela the *prodromoi* are occasionally mentioned being used by Alexander in forced marches or pursuit.

Propontis, Greek Cities of

The Propontis (in Greek literally “before the Pontus”) is the small body of water that connects the Aegean with the Black Sea (currently known as the Sea of Marmara in modern Turkey). Its northern outlet is via the Thracian Bosphorus; its southern is the Dardanelles (or Hellespont). Both straits, as well as the Propontis itself, were popular locations for Greek colonies and settlements from the seventh century onward, as they commanded the vital and often lucrative trade routes between the Black Sea and the Aegean. Because of the importance of these routes in feeding the Athenian population, many of the cities in the Propontis became members of the

Delian League/Athenian Empire (either voluntarily or otherwise).

Greek settlement focused on the Asia Minor coast of the Propontis, as well as the narrow straits emptying the body of water; the Thracian coast was less well-watered by rivers, and had fewer harborages. One of the earliest colonies was Cios, settled by colonists from Miletus in 626/5. It fell under Persian control with their conquest of Asia Minor, but later joined the Delian League and eventually was a member of the Aetolian League. It was conquered and destroyed in 202 by Philip V who gifted the site to the Bithynian king Prusias I, who refounded it as Prusias on the Sea. The Bithynians also founded their own cities around the Propontis, such as Nicomedia in 265, which became the capital of the kingdom (and later capital of the Roman province of the same name).

Two of the most important Greek cities of the Propontis were strategically located on, and dominated, both shores of the Thracian Bosphorus. Chalcedon, on the Asian coast at the southern entrance to the Thracian Bosphorus, was traditionally colonized in 685 by Megara; the colonists were said to have been blind for missing the superior location of Byzantium, founded 17 years later by Megarians slightly further north and on the European side of the strait. With the expulsion of Pausanias, son of Cleombrotus, from Byzantium in 476, the Athenian domination of the cities of Propontis began. Both cities were commercially and financially important, with Byzantium consistently contributing 15 talents to the Delian League (Chalcedon only contributed between 3 and 9 talents). The cities of the Propontis were fought over during the Peloponnesian Wars, with Chalcedon eventually falling to Sparta, before being conquered by Byzantium in 357.

During the Hellenistic Period, the cities of the Propontis frequently clashed with, or were conquered by, Macedon and later Bithynia. In 218 Mithridates I allied with Chalcedon, Heraclea Pontica, and Byzantium against Seleucus I Nicator. Philip V swept through the area, conquering cities in 202; some cities in the region such as Chalcedon allied with Rome during the Macedonian Wars.

Prusias II of Bithynia (ca. 220–149)

Prusias II of Bithynia (ca. 220–149), known as “the Hunter,” ruled the Bithynian kingdom from ca. 182 to 149. He was the son of Prusias I of Bithynia and Apama III. In 181, Prusias joined an alliance with King Eumenes II of Pergamum, against King Pharnaces I of Pontus. Later on, he attacked his old ally, Pergamum (156–154), but he was defeated. As a result, Pergamum asked for heavy reparations. Prusias sent his son Nicomedes II to Rome to ask the Senate’s help in reducing these reparations. Nicomedes, however, with the aid of King Attalus II of Pergamon, revolted, murdered Prusias in 149, and became king of the Bithynian kingdom. Ancient sources portray Prusias II as a man whose physical deformity was combined with a vicious, uneducated, and degraded character.

Ptolemies

The Ptolemies ruled an empire centered on Egypt for most of the Hellenistic Period. The dynasty was named after its founder, Ptolemy I Soter who ruled Egypt from 323 to 283/2 (as king 305/4–283/2). Ptolemy I served under

Alexander the Great and all his male successors were also called Ptolemy. A feature of the dynasty was corule; fathers frequently associated a son with them as king, but it was not unknown for siblings to rule together. It was also not uncommon for brothers and sisters to marry—as a foreign (Macedonian) dynasty ruling over a largely Egyptian population, this was one method of ensuring dynastic purity. In addition to internal security issues because the dynasty was non-Egyptian, much of the history of Ptolemaic Egypt onward revolved around conflict with the Seleucid Empire, based in Syria.

The Ptolemies preserved their rule by maintaining firm control of the military and adapting Egyptian culture and practices. Nevertheless, there were occasional revolts and the Ptolemies (as in many Successor kingdoms) tended to keep the core of the army Macedonian or Greek. The training of Egyptians as Macedonian-style phalangites prior to the battle of Raphia in 217 seems to have been an exception to this.

Ptolemy I Soter substantially expanded his territory to include Palestine, Phoenicia, and parts of Asia Minor. Ptolemaic naval power began with his acquisition of Cyprus and Aegean islands. He also controlled most of Syria south of Lebanon and Damascus, as well as other places in Asia Minor and the Aegean islands. Much of this was achieved at the expense of the Antigonids, however, the region of Coele-Syria (essentially the coast and inland of Lebanon) became a particularly contested region between the Seleucids and Ptolemies.

The Ptolemies had mixed success against the Seleucids. They achieved their greatest power under Ptolemy III Euergetes in the Third Syrian-Egyptian War (246–241), but the loss of the Fifth War (202–195) eliminated Ptolemaic power in Asia Minor and Coele-Syria. Only Roman intervention saved Egypt from conquest in the Sixth War (170–168). Clever diplomacy ensured Ptolemaic independence until 30 when the last Ptolemaic ruler, Cleopatra VII, committed suicide after the defeat at Actium, ending the dynasty. Egypt was made a Roman province.

Ptolemy I Soter (367–282)

Ptolemy I Soter was a general and biographer of Alexander the Great. After Alexander's death, Ptolemy became ruler of Egypt (323–282) and founder of the Ptolemaic dynasty.

Ptolemy was born in 367 to the Macedonian nobleman Lagus and Arsinoe (though ancient authors mention rumors that he was an illegitimate son of Philip II). He was one of Alexander's closest childhood friends, and participated in Alexander's eastern campaign from the beginning. Ptolemy took part in the battle of Issus (333) and accompanied Alexander to the oracle of Ammon at Siwah in the Libyan desert in 331. In December 330, Ptolemy was appointed as *somatophylax*, one of Alexander's seven bodyguards and trusted deputies. Ptolemy's first independent command was against Bessus, the last Achaemenid king, whom he captured and handed over to Alexander for execution. During the campaign in the Indian subcontinent, Ptolemy was in command of the advance guard at the siege of Aornus and fought at the battle of the Hydaspes in 326.

Silver tetradrachm of Ptolemy I Soter, minted in Paphos, Cyprus, ca. 305–284. Ptolemy is depicted wearing a diadem, with an *aegis* around his neck. The reverse depicts an eagle with a thunderbolt. The coin symbolizes royal power and divine protection and links back to Alexander the Great, whose coins also showed him with the *aegis* (the symbol of protection by Zeus and Athena). Located in the J. Paul Getty Museum, Malibu, California. (The J. Paul Getty Trust)

After Alexander's death in 323, the main officers of the Macedonian army gathered for a meeting to discuss the future of his empire. It was Ptolemy's arguments that convinced the other generals that they should divide the conquered territories among themselves, and Ptolemy was given the satrapy of Egypt. Ptolemy, to strengthen his position over the imperial regent Perdiccas, managed to bring Alexander's body for burial in Egypt. In 322 he allied himself with Antipater against Perdiccas, while in 316 he joined forces with Cassander, Seleucus, and Lysimachus to resist Antigonus' ambition to reconstitute the whole of the Macedonian Empire under his

rule.

At the same time, Ptolemy tried to turn his capital city, Alexandria, into the most important city in the eastern Mediterranean. He founded the Museum and the Library, and initiated the construction of the Pharos, the lighthouse that would come to be considered one of the seven wonders of the ancient world. Ptolemy was a very effective administrator and managed to win the support of the local Egyptian population by marrying an Egyptian, restoring ancient Egyptian temples and offering sacrifices to Egyptian gods, and establishing the cult of Serapis, which fused Egyptian and Greek religious elements.

Like all Alexander's Successors, Ptolemy (in 305) assumed the title of "king" (and in his case also "pharaoh"). His success in defending Rhodes against Demetrius I Poliorcetes' assault in 304 also earned him the name *Soter* ("Savior"). Ptolemy's memoirs offered a detailed description of Alexander's campaigns and it was the main source of the account written by the later historian, Arrian. Ptolemy I died in 282 and he was succeeded by his second son, Ptolemy II Philadelphus, who was already coregent since 285. The dynasty of the Ptolemies lasted for some 300 years.

Ptolemy II Philadelphus (308–246)

Son of Ptolemy I Soter, and joint ruler from 285. Ptolemy Philadelphus ("Sister-loving") married his sister Arsinoë who displaced his existing wife (also an Arsinoë). She reputedly exercised considerable influence over him

until her death (270). In 279 Magas, Ptolemy's half-brother, the governor of Cyrenaica, rebelled. In 274 Magas and his father-in-law, Antiochus II launched a coordinated attack on Ptolemy. This, the First Syrian-Egyptian War (274–271), ended in stalemate. The Second Syrian-Egyptian War (260/59–ca. 253) was sparked by Ptolemy. This also ended with no appreciable gains for either side, although it caused Ptolemy considerable financial difficulties and temporarily damaged Ptolemaic naval power in the Aegean. Ptolemy died in 246 and was succeeded by his son Ptolemy III Euergetes.

Ptolemy III Euergetes (Reigned 246–221)

Son of Ptolemy II Philadelphus, Ptolemy Euergetes (“Benefactor”) came to the throne shortly after the death of Antiochus II of Syria. Antiochus’ death sparked a succession dispute pitting his first wife (Laodice) and her son Seleucus II Callinicus against Ptolemy’s sister, Berenice, (Antiochus’ second wife) and her son. Ptolemy began the Third Syrian-Egyptian War (246–241) by marching north to support his sister, and continued it after his sister and nephew were murdered. Despite some reverses, the war ended with Ptolemaic territory at its greatest ever extent. Although many of the gains seem either ephemeral or perhaps exaggerated, Ptolemy did gain the valuable prize of Seleucia-in-Pieria (Antioch’s port). He poured considerable money into Greece to counter Macedonian power, initially supporting Aratus of Sicyon, but then Sparta and the Aetolian League. Despite this, Ptolemy lost naval control in the Aegean to Antigonus II Gonatas. He did, however, retain sufficient seapower in the east to allow him to operate with relative impunity against the Seleucid navy. Ptolemy had a reputation for

good government and sound financial management.

Ptolemy IV Philopator (ca. 244–205)

Son of Ptolemy III Euergetes, Ptolemy Philopator (“Father-loving”) was king of Egypt from 221 to 205. He had a troubled reign, although after a run of defeats and territorial losses Egypt unexpectedly snatched victory in the Fourth Syrian-Egyptian War (221–217). However, the resistance seems to have been directed by Sosibius, Ptolemy’s minister, who took the unusual step of training Egyptians in the Macedonian phalanx. This was crucial to the victory at Raphia (217) but may to have led to postwar internal issues. Egyptian priests seem to have taken a more independent line, and the Thebaid revolted around 205 and could not be recovered for some time. The same year Ptolemy was assassinated by two of his ministers, Sosibius and Agathocles.

Ptolemy V Epiphanes (Reigned 210–180)

Son of Ptolemy IV Philopator and joint king with him (as a minor) from 210. Ptolemy Epiphanes (“Made Manifest”) became king in his own right, still as a minor, in 204. However, Antiochus III the Great and Philip V of Macedon took advantage of his minority rule to seize Egypt’s overseas territory. Egypt lost the Fifth Syrian-Egyptian War (202–195) and with it Coele-Syria

and Palestine; however, Rome prevented Antiochus from invading Egypt proper. Ptolemy was more successful internally—the Thebaid was regained (187/6) and a local revolt suppressed (184/3).

Ptolemy VI Philometor (ca. 186–145)

Son of Ptolemy V Epiphanes, Ptolemy Philometor (“Mother-loving”) ruled jointly with his mother, Cleopatra I from 180 to 176. He ruled alone from 176 to 170 and again from 163 to 145, but from 169 to 164 jointly with his brother Ptolemy VIII (Euergetes II) and with his sister/wife Cleopatra II. His reign was marked by internal dissension—he was exiled in 164/3. Ptolemy lost the Sixth Syrian War to Antiochus IV Epiphanes, only retaining Egypt because of Roman intervention. He died of wounds fighting Alexander I Balas.

Ptolemy Ceraunus (ca. 320–279)

This Ptolemy, who was nicknamed Ceraunus, “Thunderbolt,” was the eldest son of King Ptolemy I of Egypt by his first wife, Eurydice daughter of Antipater. When he was pushed aside from the succession to make way for Ptolemy II Philadelphus, Ceraunus tried to get himself reinstated by first

Lysimachus and then Seleucus. Ceraunus was with Seleucus when he defeated Lysimachus at Corupedium (281) but shortly afterward personally assassinated him just after he had landed in the Thracian Chersonese.

Ceraunus put himself at the head of Seleucus' army and took over Lysimachus' kingdom. He also obtained the Macedonian throne by making an agreement with Pyrrhus, then preoccupied with his Italian expedition, and defeating Antigonus II Gonatas in a sea-battle. After one year of his rule, Macedonia was invaded by the first wave of Celts (279). Ceraunus' hastily levied army was heavily defeated and he was captured and beheaded.

Ceraunus had a high sense of entitlement due to his birth but was ruthless and incapable.

PTSD (Post-Traumatic Stress Disorder)

Although the condition had been identified and named by late seventeenth-century Swiss and German doctors and was known variously as “shell shock” (World War I) or “battle fatigue” (World War II and Korea), it was officially recognized under the name PTSD (Post-Traumatic Stress Disorder) by the American Psychological Association in 1980. It refers to the psychological issues deriving from severe trauma such as combat, accidents, physical attacks, rape, or any other traumatic experience. Symptoms include depression, flashbacks, nightmares, panic attacks, exaggerated response to loud noise, heart palpitations, and shaking.

Although the ancient Greeks had no formal term for PTSD, it is inconceivable that it did not affect them. However, it could be argued that the incidence and perhaps severity of PTSD in ancient soldiers may have

been less than today, because of both differences in warfare and also cultural differences. For citizen soldiers at least in the Classical Period, hoplite warfare generally involved a short campaign, resolved in one battle. Ancient soldiers were not subject to high explosive or automatic weapons and anything other than edged or missile weapons such as arrows and javelins were rare (one exception is the “flamethrower” at Delium, described by Thucydides, 4.100). Soldiers would have served in close formations (itself a comfort) alongside friends and members of their local community, performing what was seen as a civic duty—all fit adult males with the means to buy equipment were expected to serve. There was no separation of civil and military and any community division over a war did not result in criticism or targeting of those who served—as was the case with the Vietnam War. As in modern times, ancient states and societies had measures to make service and death more palatable, including maintenance of war-orphans, and monuments, public funerals, speeches, and art honoring those who died on active service.

However, these factors should not be used to underestimate the effects of ancient warfare on participants. The fear of death would have been just as real, and facing one’s enemy eye-to-eye and dispatching them with a sword or spear is more immediate and arguably more traumatic than firing a long-range shot. The execution of prisoners of war was not uncommon and this was also likely to have had an effect on those carrying it out. In addition, ancient soldiers had none of the modern support mechanisms available to today’s veterans. Presumably one of the coping mechanisms, as today, would have been self-medication with alcohol. In the late fifth century and the Hellenistic Period, as warfare became more professional, and more extended, men increasingly served for longer periods. The armies of Philip II and Alexander the Great of Macedon regularly campaigned all year round and, in Alexander’s case, for years at a time. On balance then, while ancient soldiers were generally not subjected to the same level of sustained service and the violence inherent in gunpowder- and high explosive-era warfare, PTSD is likely to have occurred in some form or another, although not necessarily with the same range of symptoms.

Although there is no extant medical treatise or any discussion of a condition like PTSD in the ancient literature, there are apparent examples of it. In his seminal 1994 study Jonathan Shay compared Homer’s portrayal of Achilles with American Vietnam War veterans he was treating. He

identified in both common symptoms arising from a common set of experiences (including a feeling of betrayal by one's own commanders). The story of Epizelus at Marathon is also often seen as an example of PTSD. In this case Epizelus was struck blind in the middle of the battle without any physical injury. He remained blind for life and ascribed his condition to seeing a phantom of a huge hoplite whose beard covered his whole shield, who bypassed Epizelus and killed the man next to him (Herodotus 6.117, Document 3). The Spartan general Clearchus, with his excessive love of war and his heavy punishments inflicted during erratic rages and then regretted (Document 14) could also be seen as perhaps suffering from PTSD.

Although this article focuses on soldiers, PTSD would also have occurred in civilian populations affected by warfare. For example, several Greek tragedies are centered on this, including Sophocles' *Antigone* and Euripides' *Trojan Women* and *Hecuba*.

[Pydna, Battle of \(168\)](#)

Philip V of Macedon's successor, Perseus, led Macedon into the Third

Macedonian War against Rome after a few years of building up his military forces. The final battle of the war, Pydna, lasted less than an hour and demonstrated the vulnerability of the *sarissa* phalanx when fighting on uneven terrain without cavalry support against a maneuverable enemy. The battle is best known as the final defeat of the Macedonian *sarissa* phalanx and resulted in the end of the Kingdom of Macedon.

After a few initial losses in the war, Perseus began to gain the upper hand with small victories against Roman armies and took up a strong position over the River Elpeus. The new Roman Consul, Lucius Aemilius Paullus, was determined to end the war quickly. He ordered his subordinate, Publius Cornelius Scipio Nasica Corculum, to head to the coast as if ready to launch a river-borne assault on Perseus' position. Instead Nasica moved south, then west, and finally northeast over the mountains to outflank the Macedonian army. Roman deserters informed Perseus of the plan but the force he sent to block Nasica, 12,000 men under Milo, was quickly defeated and fled back to Perseus' camp. Perseus moved his army northward to the village of Pydna, selecting a field of battle that was wide, flat and open providing the Macedonian *sarissa* phalanx with perfect conditions for battle. Paullus joined Nasica and headed north but finding Perseus' army already drawn up in battle formation pitched camp on the foothills to recover from the march. That night there was a lunar eclipse that was perceived by the Macedonians to signal the defeat of their king.

Paullus delayed attacking until the afternoon of the following day. Perseus did not attack presumably because the Romans were in the foothills. The battle began either when Paullus purposefully sent an unbridled horse forward to engage the enemy and instigate a skirmish, or when some Romans foraging for food came too close to Perseus' army. Either way the skirmish developed into a full-scale battle.

The Macedonian phalanx was initially successful in opposing the Roman legions, the length of the *sarissae* preventing the Romans from closing to use their swords. The sight and prowess of the phalanx supposedly terrified Paullus and began to affect Roman morale, showing how formidable the phalanx was in a frontal assault. Once the phalanx pressed forward too far and got onto broken ground, gaps began to appear in the formation as some advanced faster than others. The Roman infantry, perhaps following the instructions of Paullus, attacked the gaps independently creating many small conflicts but avoiding facing the *sarissas* head on. The phalanx quickly

broke apart and a wholesale slaughter began. Perseus retreated with his cavalry apparently having never joined the attack.

Of the Macedonian soldiers, 25,000 died but only 80 to 100 Romans. Eventually Perseus and his family were forced to surrender to the Romans after all his soldiers, friends, and courtiers abandoned him during a brief flight to Samothrace.

Pylos (Sphacteria), Battle of (425)

An Athenian victory against Sparta on an island (Sphacteria) next to Pylos, a headland in Messenia on the west coast of the Peloponnese (modern Navarino Bay). Thucydides provides a detailed contemporary record of the action. Earlier that year (425) the Athenian general Demosthenes had seized and fortified the undefended Pylos as a base for raiding Spartan territory and creating unrest among the Helots. The Spartans tried but failed to recapture Pylos and during this attempt a contingent of Spartans on the nearby island of Sphacteria was trapped by the Athenian fleet. The battle of Pylos (Sphacteria) was the final part of the action at Pylos and involved an Athenian assault on Sphacteria and the capture of most of the Spartans there.

The battle is interesting for several reasons: the debate in the Athenian assembly which authorized the assault, and the success of light troops (supported by hoplites) against even the redoubtable Spartan hoplites. Although clearly influenced by Thucydides’ dislike of Cleon, the account of the debate between Cleon and Nicias in the assembly is quite plausible. Outmaneuvered by Nicias, Cleon ended up in command, having vowed to

take the island without taking further Athenian troops. He took with him peltasts and archers, Lemnians and Imbrians and, according to Thucydides, on arrival left the detailed planning to Demosthenes.

A fire on the island had revealed the Spartan numbers (440 hoplites) and the best landing sites. Demosthenes and Cleon assaulted with a force that included 800 hoplites, 800 archers, 800 peltasts, and crew members from around 70 ships. The Athenians surprised the first guard post and overran it. Dividing into 200-strong groups of light troops backed up by a hoplite phalanx, they then harassed the main body of the Spartans. Unable to come to grips with the enemy hoplites, under a continual barrage of arrows, javelins and stones, without water and in burnt out terrain, the remaining 292 Spartans surrendered. The prisoners were taken back to Athens and were to be executed if the Peloponnesian League invaded Attica again. The news of the surrender was greeted with disbelief in Greece—since Thermopylae nobody had thought that Spartans would give up like this.

Part of the island of Sphacteria, off Pylos in the southwestern Peloponnese. The rugged terrain of the island made it more suitable for Demosthenes' and Cleon's light-armed troops than for the Spartan hoplites who were trapped there. (Photo by Peter Londey)

Because the enemy were Spartans, Pylos was a more spectacular demonstration of the utility of light troops in the right circumstances than the battle of Spartolus in 429. It reinforced Demosthenes' experience in the

Naupactus campaign (426) and at Olpae (426), and may have influenced later Athenian tactics, for example, at Lechaeum (390). The Athenian victory was a major psychological blow to Sparta. It allowed ongoing and significant damage through raiding and encouraging Helots to desert and meant that Attica was now safe from annual ravaging. Ironically, the inability to invade Attica led the Spartans to focus on the Chalcidice, the loss of which was serious enough to bring Athens to make peace with the Peloponnesian League in 421.

Pyrrhus (319–272)

From a dynasty claiming descent from the great hero Achilles, Pyrrhus was king of Epirus for several years in the early third century, beginning as a child. He had a good claim to be king, but so did others. He was expelled several times and in those periods sought other adventures and possibilities for power. He travelled to Asia, Egypt, Italy, and Sicily. An adventure in the city of Argos in 272 resulted in his unglamorous death. He was involved in street fighting and the mother of his temporary opponent was watching from a roof. She grabbed a nearby roof tile and hurled it downward, striking Pyrrhus in the head.

As a very young man, Pyrrhus was involved in the great battle of Ipsus in 301, where he acquitted himself well in a losing cause. He spent some time at the court of Ptolemy in Alexandria. Pyrrhus and Lysimachus jointly invaded Macedonia in 297, but three years later Demetrius I Poliorcetes

invaded and made himself king until 285. Pyrrhus was king for several more brief intervals until he decided to respond to a request for help from the south Italian city of Tarentum. This began an adventure in south Italy and Sicily, which would keep him there for the next four or so years (roughly 280–276). He fought with or against Tarentines, Syracusans, and Carthaginians, and occasionally Romans. His battles with Romans have given rise to the phrase “Pyrrhic victory”: after winning the battle of Asculum in 279, but with more heavy casualties (troops he could not easily replace), he is alleged to have said, “One more such victory and I am undone” (Plutarch, *Pyrrhus* 21). He did in fact leave Italy shortly thereafter and went to Sicily. Sicily proved no more successful for him than Italy, and after his return to Italy and final defeat there, at Beneventum in 275, he returned to Epirus.

He found much chaos in Greece in which to meddle. Antigonus II Gonatas had recently become king of Macedonia, and would remain in that position even if Pyrrhus had some hope of returning. There were local factions in Sparta, and in Argos, which sought help of the now famous Pyrrhus. He was not only famous as a general, but also as a fighter. In Argos, Gonatas supported one faction, and Pyrrhus the other. He was decapitated after being stunned by the tile in the ensuing street fighting, and his head recovered by an illegitimate son of Antigonus Gonatas, who proudly presented it to his father. Gonatas was not pleased; he scolded his son for “barbaric” action and arranged for the proper burial of Pyrrhus.

The short life of Pyrrhus, 46 years, was filled with warfare. It was what he liked to do and knew how to do. Contemporaries compared him with Alexander the Great. His several opportunities for actually ruling were not very successful.

A Roman bust of King Pyrrhus of Epirus, perhaps a copy of a third-century Greek original, from the Villa of the Papyri, Herculaneum. Pyrrhus fought several campaigns in Italy and Sicily in the early third century. He defeated the Romans in several battles but at such a cost to his limited military manpower that they led to the phrase "Pyrrhic victory"—a victory causing more damage to the winner than the loser. Located in the National Archaeological Museum, Naples, Italy. (Araldo de Luca/Corbis)

R

Raphia, Battle of (217)

The battle was fought in 217 between the armies of the Seleucid king, Antiochus III the Great, and King Ptolemy IV Philopator of Egypt, during the Fourth Syrian-Egyptian War. Nearly half of Ptolemy's phalanx at Raphia was composed of Egyptians armed and trained to fight as a Macedonian phalanx. This reliance by Ptolemy on Egyptian (rather than Greek and Macedonian) troops led to increased Egyptian influence within the Ptolemaic administration.

Antiochus had an army consisting of 62,000 infantry, 6,000 cavalry, and 102 Indian elephants. Ptolemy's forces numbered 70,000 infantry, 5,000 cavalry, and 73 African elephants. Antiochus opened the battle, unleashing an elephant attack against the elephants on Ptolemy's left wing. Ptolemy's outnumbered elephants fled, causing havoc amongst the Ptolemaic Agema (Royal Guard) and cavalry who were stationed on the same wing. Antiochus followed up his success by launching the remainder of his troops on his right wing against Ptolemy's shaken left wing, driving them back, but at this crucial moment Antiochus left the battlefield in pursuit of Ptolemy's defeated left wing. Ptolemy's cavalry on his right wing outflanked Antiochus' left wing, and with the support of elephants, Greek mercenaries, Gauls, and Thracians drove off Antiochus' left wing. Finally, Ptolemy's phalanx, consisting of some 25,000 Macedonians and 20,000 Egyptians, secured the victory in the center.

Ptolemy did not aggressively follow up this victory. However, Antiochus' losses and the risk of Ptolemy advancing into Syria proper caused Antiochus to withdraw from Coele-Syria and make peace (which lasted until 202).

Ravaging

Agricultural ravaging was one of the most common tactics in Greek warfare, a normal part of any invasion of an opponent's territory. It served several interlinked purposes: as a form of psychological warfare; as a means of damaging an enemy's agricultural economy; as a way of forcing an enemy to give battle; as a form of foraging; and as a source of plunder.

Greek historians constantly refer to armies ravaging enemy agriculture, but rarely describe it in detail. The work might be carried out by hoplites, light-armed troops, or other attendants (such as slaves or Helots). Greek farms were generally small, mixed farms, separated by stone walls or hedges. The main crops were grain, vines, and olives. If an invasion took place in the month before harvest, then grain could be burnt, with devastating results. Before that (up to about mid-May) it was too green and would not burn, and the ravagers would have to trample or cut it, a much more time-consuming process. Plutarch tells us that ravagers usually used sickles or knives to cut grain, but that in the third century Cleomenes III devised pieces of timber specially shaped to shatter the grain more efficiently. If grain was ready to be harvested, the invaders might choose to harvest some of it for their own use, after scaring the defenders away. Later in the year, the ravagers might be able to capture and cart away stored grain from farmhouses and villages.

Greek vines grew close to the ground, making them difficult to break by trampling, especially in spring or summer when they were still fairly pliant. Vines are also difficult to burn or to pull out of the ground. The most common method of destruction was cutting the stems, something complained about by the chorus in Aristophanes' *Acharnians*. Olives,

especially for the production of olive oil, were an important and valuable crop in Greece, but olive trees are difficult to destroy. It is an enormous job to dig an olive tree out by the roots, and there are only a few references to attackers burning trees, possibly because it needs a lot of fuel to make an olive tree burn, but also because olives will regenerate after being burnt. Instead, the ravagers would either chop entire trees down—a large undertaking with a mature tree—or, more commonly, chop or saw branches off.

Ravagers would also do as much damage as possible to farmhouses, other farm buildings, and equipment. Houses would be looted of any valuables that owners had been unable to take away, and then burnt down. Most commonly they had stone foundations and mud-brick walls, but the walls and the tiled roof depended on a timber frame and beams, which would burn as long as some brush was brought in as fuel. Other equipment, such as olive presses, would also be attacked, while any farm animals left behind could be driven off or, very likely, killed and eaten by the invaders.

When an invasion was impending, farmers would naturally evacuate themselves, their families and livestock, and as much of their valuable property as possible. They would harvest whatever they could and remove stored produce, as well as rescuing portable farm tools and household furnishings. In 431, before the first Spartan invasion of the Peloponnesian War, the Athenians even removed the woodwork from their houses. The most obvious place to evacuate to was the fortified *polis* center; this was the prime purpose of city walls, to provide a safe haven (especially in the fifth and early fourth centuries when fortified cities were very rarely taken except by starvation or treachery). It has been argued that even the Athenian forts on the border with Boeotia were less important as defensive sites to prevent enemies from invading Attica than as safe havens for the outlying Attic population who would not have time to get to Athens itself. But people might also evacuate to safe areas nearby, probably preferable to crowding the town with livestock. When the Persians arrived in 480, some Phocians took their belongings up to a spur of Mount Parnassus, while others found refuge in Amphissa in western Locris, while the people of Delphi sent their women and children across the Corinthian Gulf to Achaëa and their property either to the sacred Corycian Cave on Parnassus or, again, to Amphissa. Faced with the same danger, the Athenians sent their families and possessions to Troezen, Aegina, and Salamis, while in 431 they

sent their animals to Euboea and other islands.

But the defense against ravagers was also often more active. In particular, cavalry would be sent out to disrupt the ravagers' work as much as possible. The invaders were vulnerable because the very act of ravaging forced them to scatter, out of formation and in small, dispersed groups, to be effective over as wide an area as possible. While some troops would be deployed to protect those actually wreaking havoc on farmers' land, cavalry (and perhaps light troops) could come on them quickly and inflict casualties. This was a major function of the Athenian cavalry during the Second Peloponnesian War. But the attackers could also escalate the conflict by setting up a permanent base in the defenders' territory, as the Athenians did in the Peloponnesian War with a base at Pylos, and the Spartans later by fortifying Decelea.

Ravaging could certainly cause an enemy temporary food shortages, but there is argument over how much permanent cost ravaging inflicted on farmers. It used to be assumed that the losses were devastating, especially damage to olive trees, which take decades to grow. But more recently Victor Davis Hanson has argued that the damage, while annoying, was not economically crippling. As noted above, doing serious damage to most crops was a labor-intensive activity. The more efficiently it was done, by dispersing the ravagers over a wide area, the more vulnerable they were to counter-attack. Farms were small and often in difficult terrain. Grain crops would only burn close to harvest time, a period when citizen soldiers preferred to be at home working on their own farms. Hanson estimates that it would take, at the most optimistic, 33 hours of labor to cut the vines in a one-acre vineyard, and even cut vines would soon sprout again. The loss to the farmer would only be one year's crop. Damaging olive trees again involved a great deal of work, and with grafting the farmer would be back in production in a few years. That was serious, but most farms were mixed, so farmers did not depend on any one crop.

One of the best documented examples of ravaging is the five Spartan invasions of Attica between 431 and 425, in the first half of the Peloponnesian War. These were brief invasions, each of a few weeks, carried out at a time of year to maximize damage to grain, thus allowing autumn crops such as vines and olives to be harvested. Each invasion only targeted parts of Attica. Hanson calculates that, even with large armies of over 20,000 men, over a total of roughly 150 days for the 5 invasions, the

Peloponnesians may have had 3.5 million man days with which to ravage Attic agriculture. We do not know exactly how much of Attica was under cultivation, but Hanson estimates that this allowed 15 man days per acre of cultivated land, over the whole 10 years of the Archidamian War. But since a large invasion could not happen by surprise, farmers could return to their land to repair things while the Peloponnesians were away. The conclusion would be that the economic damage done to defenders was serious (especially at an individual level) but not crippling. That balance might alter: for a period during the Peloponnesian War Athens invaded neighboring Megara twice a year. This probably did have a devastating effect on Megarian agriculture, and the resulting Megarian poverty made a pleasing joke for Athenians in Aristophanes' *Acharnians*, produced in 425.

But the real point of ravaging was not economic damage, though the Spartan occupation of Decelea probably did reduce the Athenians' ability to fight. Rather, it was annoyance. Small farmers who toiled on their farms year after year would be hugely confronted by having willful and unnecessary damage done to their crops and equipment. Sometimes ravagers were seeking a specific result, to force defenders out from behind their walls. In 431 the Spartan king Archidamus chose to ravage the large deme of Acharnae, only seven miles from Athens and within view of its walls, because he thought the numerous Acharnians would incite their fellow citizens to come out from behind the Long Walls and do battle with the Spartans. According to Thucydides, there was indeed dissent against Pericles' policy of refusing battle to the superior Spartans, but Pericles was able to convince the citizens to stick to his policy.

But the Spartans kept coming back, and Greek armies kept ravaging other states' territory, because ravaging represented a victory in itself, bringing honor to oneself and shame on the enemy who allowed such wanton damage to be done to their farms. And, like violent supporters of football teams, the Greeks fought wars as much for status as for any material gain.

Religious Practices before Battle

The significance of religious practices before battle should not be underestimated. At Plataea, the Greeks refused to move, despite enduring damaging arrow-fire from the Persian host. Their seer had not yet received favorable omens. Only once the rites had been successfully concluded, would they commit to battle.

Ceremonies and Procedures

The most common rituals conducted before battles were blood sacrifices (*sphagia*). Livestock would accompany the army, not just for provisions, but also for sacrifice. A beast might be selected and ritually cleansed with a splash of water. The priest would recite a few prayers and lead the animal to an altar, where a few hairs might be cut from its forehead and a sprinkle of barley grains added as “first fruits” to be burnt in the fire for the gods. The animal would then be butchered, with its blood collected separately in a bowl. The Spartans would usually slaughter a goat for Artemis Agrotera. The ancient sources tell us that the entrails would be examined—in particular, the liver—for signs of what was to come. The bones, wrapped in

fat, would be given up to the gods through the fire. Libations of wine might also be involved at some point in these ceremonies. Homer, Pausanias, and other commentators note the expectations of the gods in receiving these sacrifices and how they could be easily angered if ceremonial requirements were not dutifully observed.

All armies sacrificed before engagement, but significant differences existed from *polis* to *polis*. Local heroes and deities had to be appeased or entreated for assistance. Similarly, the different circumstances of each conflict could lead to different approaches. The divinity, choice of beast, manner of its slaughter, role of the priest, and the precise nature of the rites and prayers could vary considerably.

Although being a seer was not a profession as such, the role required specific skills and could hold great status. Occasionally, a military leader could perform the sacrifice, but this was unusual. The best seers held a special place in the army and broader society. The Spartans and Athenians recognized the value of winning favorable omens and took great trouble to recruit those who had the best credentials. Great honors were bestowed by the Spartans upon the memory of the seer, Teisamenus, whose religious duties were considered to have helped deliver the major victories of the Persian Wars. The Spartan festival of the *Carneia* was said to have been established by the ancient Dorians to appease Apollo for the murder of the Arcadian seer, Carnus, a favorite of the god.

In the myths, we hear of human sacrifice before or after battle. This may have occurred in Mycenaean times. The poets say that Agamemnon's daughter, Iphigenia, was sacrificed at Aulis to win the favor of the gods before the Greek fleet sailed against Troy, and Achilles slaughtered 12 Trojan youths in retribution for the death of his beloved Patroclus. But beyond the literature, there is almost no evidence of human sacrifice in Greek religion after the Bronze Age. Phantias of Lesbos, a late commentator, may have asserted that Persian captives had been sacrificed at Salamis, but his account is unconvincing.

In fact, even amid the gore of the battlefield, religious sensibilities were usually piously observed, including mercy for suppliants and respect for the bodies of the slain. It was important not just to win the favor of the gods before battle, but also to keep them on side during the course of the conflict itself. Even after battle, it was important to observe religious practices and keep the state free of *miasma* (religious pollution). Following the battle of

Plataea, Athens ensured the ritual cleansing of the state by fetching a new fire from Delphi for all the hearths of the state. Thucydides describes elaborate arrangements to honor the unburied slain of Athens and uses it to contrast the disrespect shown the dead during the worst days of the plague of 430.

Seeking Support from the Gods

Well before a battle was fought, many states would go to great trouble to win the approval of the gods for the coming campaign. For example, in the sixth century, the Spartans went to extreme lengths to repatriate the bones of Orestes, which they had been told were necessary if they were to defeat the Tegeans. Similarly, Cimon had the bones of Theseus returned to Athens in 475 at great expense and ceremony.

The control or favor of panhellenic sanctuaries was also important. During the early days of the Second Peloponnesian War, Athens found itself out of favor at Delphi, the greatest of all oracular sites and panhellenic sanctuaries. This may explain why the Athenians turned to Delos, which was within their control, as an alternative site where they could more readily buy the favor of the gods and the oracular advice that suited them. But even if a state was in favor at a sanctuary and appeared to receive positive advice, it had to interpret responses very carefully. The Lydian king, Croesus, according to Herodotus (1.33), was advised that, if he were to attack the Persians, he would “destroy a powerful state.” Croesus did not realize that the powerful state to be destroyed would be his own.

Delphi was preeminent, not just as the religious and physical center of the Greek world, but because the oracle of Apollo was also the most authoritative. The ancient Delphic Amphictyony, a league of adjacent independent states, acted to protect the integrity of Delphi. Up to four sacred wars, one legendary and three historical, were believed to have been fought over its control. The importance of influence at Delphi is demonstrated by the oracle’s change of attitude to Cleisthenes of Sicyon. The Pythia, the priestess through whom the god gave oracles, first insulted him by calling him a “stone-thrower,” but later Cleisthenes became the oracle’s chief benefactor. This is also evident when noting the privileged treatment granted states in later years. Thebes enjoyed *promanteia* (i.e., the right to consult the oracle early) during its hegemony. Demosthenes accused the Pythia (the priestess who delivered the oracle) of “philippizing” during

the time of a large Macedonian presence at the sanctuary. However, the priestly administration itself seems to have encouraged largesse and it is only occasions of particularly covert and distasteful attempts to bribe it, or instances of outright bullying, which seem to have aroused the rancor of Apollo Pythius.

Rhodes, Rhodians

Rhodes, a large island in the southwestern Aegean close to the coast of Caria (in the Dodecanese in modern Greece), was originally settled by Dorians, who founded the three major cities on the island: Ialysus, Lindus, and Camirus. The three-way division of the island is attested by Pindar, and the cities were known to Homer. The three cities established colonies in their own right (such as Gela and Rhegium, both settled by colonists from Lindus), and began to mint their own coinage. Individually, they were also all members of the Dorian *hexapolis* (lit. “six cities”), and collectively they were among the founders of Naucratis, the Greek trading colony in the Nile Delta in Egypt. The cities all were renowned for their navies, and all had occupied territory beyond the island of Rhodes itself (mainly in neighboring islands, and in the mainland of Asia Minor). During the fifth century, all three cities allied themselves with Athens, and were tribute-paying members of the Delian League—Ialysus contributing 5 talents in 421/20 and Camirus contributing 10 in 416/5.

There seems to have been a long history of unity among these Rhodian cities. Homer referred to the Rhodians as a discrete ethnic grouping, with Ialysus, Lindus, and Camirus as the names of three different Dorian tribes among which the inhabitants of the island were spread. By the fifth century, this pan-Rhodian unity found expression through a common foundation myth. This claimed that each city was founded by three eponymous brothers, the grandsons of Helios (a popular divinity among the Rhodians). In 411, during the Second Peloponnesian War, this unity was reflected through a common assembly of citizens from all three cities which decided to defect from Athens and join the Spartans. The war with Athens was the common cause that pushed the rhetoric of synoecism into reality, and in 408 the federal state of Rhodes was created, with its capital in the newly created city of Rhodos (Rhodes).

This new capital featured an extensive necropolis, five favorable harbors, and the appropriate state buildings and law courts for the new polity. The constitutional aspects of the federation seem to have been established quickly, with *de jure* merger occurring over a period of time: citizens from Ialysus were still being appointed as hosts for Athenian ambassadors in 394. Despite this, the federation was completed during the early fourth century: priests of Helios attained island-wide political positions and coins were now no longer minted by any individual cities on the island but jointly in the name of Rhodes.

Rhodes' alliance with the Spartans in 411 did not last: the crippling financial obligations exacted (32 talents) saw the island reinstate relations with Athens in 396, followed thereafter by a democratic revolution in 395. Rhodes joined the Second Athenian Confederacy in 378/7, but left Athens again during the general revolt of its allies in the Social War of 357–355. Now alone, the island fell under Persian influence for the next two decades, and was ruled by Mausolus of Caria. Rhodian loyalty to the Great King was amply demonstrated with their assistance to the Persian reconquest of Egypt, and resistance to Philip II of Macedon. This lasted until Alexander the Great's invasion of the Persian Empire and his victory at the battle of Gaugamela in 331.

During the Hellenistic Period, Rhodes tried to remain independent from the wars of the Successors (*diadochoi*). Nonetheless, the ancient and close ties between Egypt and Rhodes were maintained with the Ptolemaic court, an alliance that was to last unbroken for three centuries. This association,

along with its staunch independence, provoked the wrath of Antigonus I Monophthalmus, who besieged the island with his son, Demetrius II Poliorcetes in 305. Rhodes' survival only served to increase its prestige and cement its position as one of the richest Greek states. Leveraging this victory, Rhodes was able to broker a non-aggression pact between the Antigonids and Ptolemies, as well as fund the construction of a giant bronze statue to Helios, bestride the entrance to its chief harbor—the famous Colossus of Rhodes, one of the seven wonders of the ancient world.

Disastrously the Colossus, along with much of the city walls, docks, and buildings, were all destroyed by earthquake in 227/6. With consummate diplomacy, Rhodes was able to exact contributions from many of the Hellenistic monarchs and dynasts, and retained its position as chief sea power and arbiter of Aegean commercial and mercantile interests. Rhodes led an alliance to war against Byzantium in 220 on the grounds that that city had been imposing crippling tolls on ships sailing through the Thracian Bosphorus, to the detriment of trade elsewhere in the Mediterranean. During the second century, Rhodes continued to expand its control and interests in the eastern Mediterranean. Naval bases were established in Crete, a confederacy of Cycladic islands was created, and land conquests were increased throughout Asia Minor, to include Lycia and much of Caria.

Rhodes maintained peace with Rome by siding with it against the Hellenistic kingdoms, whether it was Philip V or Antiochus III the Great. Because of this loyalty, they endured the siege of Mithridates VI Eupator in 88, but were rewarded with a donation of territory from Sulla after the war ended in 64. Rhodes remained independent during the Roman civil wars, even after the battle of Actium in 31, and was not incorporated into the province of Asia Minor until 44 CE.

Rhodes, Siege of (305–304)

Demetrius I Poliorcetes, son of Antigonus I Monophthalmus, besieged Rhodes at his father's instruction. The siege lasted for a year but ultimately failed. Despite this failure Demetrius was known as "Poliorcetes" ("The Besieger"); clearly an ironic nickname.

Rhodes, friendly to Ptolemy I of Egypt, had refused a summons to fight against Egypt but would have surrendered had Demetrius not demanded entry into the city with his fleet. The Rhodians sent away all those unwilling or unable to fight leaving 7,000 men as well as freeing slaves who opted to stay. Demetrius led a large army and fleet with experienced engineers and siege train and employed pirates, possibly as many as 1,000 ships, to blockade Rhodes' harbors.

Demetrius attacked the main harbor and the city walls but failed to prevent reinforcements of supplies and troops from entering the city. After weeks of fighting Demetrius gained a foothold but a storm forced him off, destroying many of his ships and his siege towers, and allowing the Rhodians to regain the harbor. Demetrius delayed for a few days rebuilding his towers, then abandoned the harbors and attempted land assaults. Demetrius failed to prevent Rhodian ships sallying out and capturing valuable supplies, including some renowned engineers and dresses intended for Demetrius' wife. Demetrius attacked repeatedly with the famed siege engine, the Helepolis (ca. 135 feet by 65 feet on eight wheels 15 feet high), but was repulsed when Demetrius, astonished that the Rhodians fired so many missiles so quickly, wanted to save the machine. Demetrius launched

a night attack through a breach but 1,500 mercenary reinforcements from Ptolemy were instrumental in defeating the only foray into the city itself. Antigonos then ordered Demetrius to make peace and the Helepolis was abandoned.

Rome, Romans

Rome was a Latin town near the west coast of central Italy. From small beginnings, it eventually came to control the whole of Italy and eventually the whole Mediterranean, including the Greek world. Rome was situated to take advantage of one of the more fordable crossings of the lower Tiber River and nearby low-lying hills for defense. From this vantage point, early Romans were able to dominate the local trade routes heading both north-south and east-west, trading salt with the inland tribes. Bronze Age remains have been found on the western slopes of the Palatine. However, by the eighth century pottery from Euboea and Corinth attests to the presence of Greek traders, and Etruscan influences appear in burial customs. Rome nonetheless remained an inherently Latin city, sharing its heritage with the other small settlements on the plain of Latium.

Union of these Latin communities, with Rome at its head, was achieved during the fifth century, at which point they began to challenge both the inland tribes of the Apennines and the Etruscans to the north. Warfare with its neighbors continued throughout the fourth century, notwithstanding the sack of the city, conventionally dated to 390, by the Celts, possibly a band of mercenaries on their way to fight for Dionysius I of Syracuse.

Drawn into the south of Italy by appeals from the cities of Campania for help against the Samnites in 340–338, Rome later formed an alliance for the first time with a Greek city, Neapolis, in 327/6, and spent the next two decades fighting the Samnites into submission. Drawn northward again against various coalitions of Etruscans, Celts, and Umbrians, Rome was

successful in defeating them in 295. Throughout the 280s, Rome became heavily involved with the Greek cities of southern Italy. After attacking the Romans in 282, Taras (Tarentum) appealed to Pyrrhus of Epirus to intervene on its behalf; Pyrrhus invaded southern Italy, probably in 280.

Facing Hellenistic armies for the first time, the Romans were narrowly defeated in 280 at Heraclea and again in 279 at Asculum. Despite his victories, Pyrrhus sustained such losses that he was no longer able to continue his campaign, coining the phrase “Pyrrhic victory,” and retreating to Sicily in 278. After attempting to fight the Romans again in 275, Pyrrhus withdrew from Italy, leaving Rome unchecked to capture Tarentum in 272.

From this point Rome was steadily drawn into conflict outside Italy, often with Greek cities and kingdoms, and within 250 years extended its empire to include the entire Mediterranean. An alliance between the Syracusans and Carthaginians helped prompt the First Punic War (264–241). During the war Rome captured a number of important Greek cities, such as Acragas, selling their populations into slavery. Rome ended the war in control of Sicily, though Syracuse retained its independence.

After the Second Punic War (218–201), Rome became directly involved in the politics of mainland Greece, stemming from an earlier alliance between Hannibal and Philip V of Macedon, which led to the First Macedonian War (215–205). After victory in the Second Macedonian War (200–196), Rome declared the freedom of the cities of mainland Greece. But the Third Macedonian War (171–168) led to the breaking up of the Macedonian state, while the Fourth Macedonian War (150–148) and the Achaean War (146) led to the annexation of Macedonia and Greece.

The Syrian-Roman War (192–188) had placed a check on Seleucid power, while Rome acquired substantial territory in Asia Minor through the bequest of the last king of Pergamum, Attalus III. Wars against Mithridates VI Eupator further extended Roman territory in the east. The process was completed with the annexation of Ptolemaic Egypt in 30.

Sacred Band

“Sacred Band” is a literal translation of the name (*Hieros Lochos*) of an elite Boeotian infantry unit that was formed in 378 and distinguished itself at the battles of Tegyra (375) and Leuctra (371). It was wiped out in a last stand at the battle of Chaeronea in 338.

The Sacred Band was a standing unit of 300 hoplites. Later sources (there are no contemporary sources extant) describe it as consisting of 150 pairs of male lovers. There is nothing in this incompatible with attested Greek social values and behavior.

Sacred Truces and Festivals

An *ekecheiria* or sacred truce was called to allow an important event to be undertaken. A number of festivals were celebrated by the ancient Greeks, which involved the announcement of a sacred truce by *spondophoroi* (sacred heralds) to safeguard the passage of pilgrims and officials to and from festival precincts. Such truces were observed for the four athletic

festivals of the *periodos* or “circuit” of games at Olympia, Delphi, Nemea, and the Isthmus.

Generally, sacred truces were dutifully observed, but some evidence suggests that the free passage of pilgrims may have been compromised during the Peloponnesian War. Sparta’s allies controlled the *periodos* and it is argued that Athens was unable, or unwilling, to send athletes to Olympia. Thucydides also claims that religious traffic to and from Delphi had been disrupted during the Archidamian War and he points the finger at the Phocians and Boeotians. In his record of the Peace of Nicias in 421, Thucydides 5.18.1–2 includes a clause which reads as follows:

Concerning the common sanctuaries, whoever wishes to sacrifice at them, to travel to them, to consult their oracles, and to visit them as delegates, may do so, according to ancestral customs, by both sea and by land, without fear.

There would have been no need to state these rights, if they had not been violated during the Peloponnesian War.

There was good money to be made from pilgrims. Aristophanes’ comic character, Peisthetaerus, jokes that the birds, who control the atmosphere of the earth, are in a position to exact tolls and conditions on the passage of the smoke from sacrifices on altars winding up through the air for the gods. He compares this position with that of the Boeotians, who took advantage of the passage of Athenians wishing to visit Delphi, saying, “if we want to consult the Pythia, we ask the Boeotians for safe conduct” (Aristophanes, *Birds* 187–188).

The *spondophoroi* themselves were sacrosanct and under the safeguard of the god Hermes. They were protected by sworn truces, panhellenic custom, and formal interstate relationships. In fact, it has been argued that the *asylia* (“asylum”) pertaining to envoys may have been a mobile form of *asylia*. Therefore, an athlete, pilgrim, or sacred herald involved in a festival of Zeus may have had a comparable degree of inviolability to a suppliant at an altar of Zeus.

Not all states were genuine in calling a sacred truce. Xenophon notes how the Argives tried to use one to avoid conflict with Sparta. The king, Agesipolis, dealt with this awkward ploy by consulting the oracles at Olympia and Delphi, where he was advised that the Argives were

disingenuous and that the sacred truce could safely be ignored.

Sacred War, First (ca. 590s)

Causes

The First Sacred War was supposedly a 10-year war fought to protect the sanctuary at Delphi against the people of the nearby town of Crisa or Cirrha (one source also mentions a lawless group, the Cragalidae). Sources variously claim that the Crisaeans or Cirrhaeans had robbed, taxed, or kidnapped visitors to the sanctuary or had plundered or in other ways committed sacrilege against Delphi.

Course

The war was fought by members of the Delphic Amphictyony, the religious league which controlled the sanctuary, under the leadership of either Eurylochus of Thessaly, Cleisthenes of Sicyon, or an Athenian, either Solon or Alcmaeon. The longest account appears in a speech attributed to Thessalus, the son of the medical writer Hippocrates. According to this account, the Amphictyonic army conquered and laid waste the territory of Crisa/Cirrha, before settling down to invest the last stronghold, located on a spur in the plain between Delphi and the coast. The besieging army itself suffered from disease, but eventually was assisted by an ancestor of Hippocrates, who showed them how to poison the fortress' water supply

with hellebore, forcing the defenders to surrender.

Consequences

The Amphictyony set up contests at Delphi to commemorate victory in the war, but the main result was that they dedicated the territory of Crisa/Cirrha, the plain immediately inland from the modern bay of Itea, to Apollo, with the injunction that it must remain uncultivated. The offending city itself was razed, though in later times the port of Delphi on the coast was named Cirrha.

Despite the vivid (though contradictory) accounts in our sources, Noel Robertson has argued convincingly that the entire war is a fiction, invented 250 years later in the fourth century around the time that Philip of Macedon settled the Third Sacred War and thereby became an influential player in Delphic affairs. Philip's role in ending the Phocian occupation of Delphi could easily be seen as analogous to the earlier war against Crisa/Cirrha. In 340, the Athenian orator Aeschines used the precedent of the First Sacred War to argue for action against the Locrian town of Amphissa, whose citizens were allegedly cultivating the sacred land. The Fourth Sacred War was the result.

The First Sacred War can be used to help explain the existence of the uncultivable sacred land in the plain below Delphi. Yet the earliest sources for the war come from the 340s. The failure of earlier writers, such as Herodotus and Thucydides, to mention the First Sacred War, strongly suggests that the earlier war was, indeed, a fiction.

Sacred War, Second (ca. 448)

Causes

What Thucydides (1.112) calls the "sacred war" (the numbering of the Sacred Wars is a purely modern convention) seems to have arisen as a result of great-power rivalry by Sparta and Athens for influence over the panhellenic religious sanctuary at Delphi and in central Greece generally.

Course

The Spartans made an expedition to Delphi and, detaching it from the control of the neighboring Phocians, gave it into the hands of the Delphians: that is, they made Delphi independent (though no doubt loyal to Sparta). In response, an Athenian expedition under Pericles seized the sanctuary and returned it to the Phocians.

Consequences

According to Plutarch, first the Spartans and then the Athenians took advantage of the conflict to have themselves awarded *promanteia*, the right of first consultation of the oracle, and had this fact inscribed on the forehead and the side, respectively, of a bronze wolf in the sanctuary. Athenian supremacy at Delphi was short-lived. After the Athenian defeat at the battle of Coronea in 447, Delphi seems to have returned to the Spartan sphere of influence, and later showed distinct favor to Sparta at the start of the Peloponnesian War in 431.

Sacred War, Third (356–346)

Causes

The Third Sacred War was a major conflict, initially over control of the sanctuary at Delphi. The war dominated affairs in central Greece for 10 years, from 356 to 346, and ultimately was the catalyst by which Philip II of Macedon became a political player in southern Greece.

The war probably arose out of conflict between the Phocians, on the edge of whose territory lay the sanctuary of Apollo at Delphi, and their neighbor to the east, Thebes, the dominant city in Boeotia. In the 360s, the Thebans gained a dominant position in the Delphic Amphictyony, an international league which controlled the sanctuary. The Amphictyony expelled Thebes' opponents at Delphi, fined Sparta for its occupation of Thebes in 382, and threatened some leading Phocians with a curse for tilling sacred land. In 356, the Phocian aristocrat Philomelus convinced his people that they should seize Delphi, which he regarded as originally a Phocian sanctuary, and annul these decrees. In this venture, he gained at least tacit support from Athens and financial support from the Spartan king Archidamus III, both opponents of the Thebans.

Course
